Bank of England.....	1629
Federal Reserve Bank of New York .....	2017

### 1. How often does the Bundesbank publish its gold bar list?

The gold bar list is published once a year on the Bundesbank's website and lists its gold holdings, broken down by custodian, as at the end of the preceding calendar year.

### 2. What data are published in the gold bar list?

The gold bar list contains the following information: the bar number, the melt number or the inventory number, the number of bars, the gross weight, the fine weight and the fineness. These data correspond to the requirements for gold storage and accounting at the Bundesbank. The data are provided to the Deutsche Bundesbank by the custodians.

### 3. What is the gross weight, the fine weight and the fineness of a gold bar?

The gross weight of a gold bar is the weight recorded when the gold bar is weighed. It is determined by the respective custodian upon receipt of a gold delivery. The gross weight of gold is quoted not only in kilogrammes (kg) but traditionally also in troy ounces (tr oz). A troy ounce is a unit of weight used for precious metals and is equal to 31.1034768 grammes. Multiplying the gross weight of a gold bar by its fineness gives its fine weight (shown in the list in kilogrammes (kg) and also in fine troy ounces (ozf)). This is factored into the Bundesbank's annual accounts and shown at its value based on the price of gold on the balance sheet date. The gross weight is not published on the Bundesbank's balance sheet but is shown in the gold bar list for the sake of completeness.

Various methods and rounding rules are used to calculate the fine weight.

One method of calculating the fine weight is to multiply the gross weight in troy ounces (tr oz) by the fineness. This provides the fine weight in fine ounces (ozf). Another method first determines the fine weight in kg by multiplying the gross weight in kg by the fineness. Then, in a second step, the fine weight is converted into fine ounces (ozf) by dividing by 0.0311034768.

Fineness denotes the actual gold content of a gold bar/gold coin, expressed as parts per 1,000. This value is usually given as a four-digit figure, eg 999.5, although some refiners have occasionally stamped the fineness on gold bars as a five-digit figure (eg 999.65).

### 4. What is a melt?

A melt is a batch of around 20 gold bars. Bars belonging to the same batch all have the same fineness as they were cast in one melt. As the individual bars have different gross weights, only the total melt is recorded in the gold bar list with its gross and fine weight, and its fineness. All of the bars from a given melt bear the melt number instead of an individual bar number.

## The Deutsche Bundesbank's gold holdings

### **5. What is a bar/melt number and what is an inventory number?**

All gold bars are assigned a number so that every bar or every melt – if necessary taking other gold bar features into account – is uniquely identifiable. Refiners do not use a standardised system for numbering bars and melts, ie the digit ranges used for melts and individual bars may be either alphanumeric or numeric, and have a varying digit length as defined by the respective refiner of the gold bars. Whereas bar and melt numbers are issued by the gold refiner, inventory numbers are assigned by the custodian in whose vaults the gold is stored. Inventory numbers are either stamped or affixed to the bar using a label.

### **6. How are gold bars identified at the Bundesbank's various custodians?**

The various custodians used by the Bundesbank for storing its gold holdings use different numbering systems for identifying the gold bars. The Bundesbank and the Bank of England use internally assigned inventory numbers, whereby the Bank of England only allow part of this internal number to be published. The gold bar list therefore only shows the last three digits for its gold bars stored at the Bank of England. The Federal Reserve Bank of New York (Fed), on the other hand, identifies the bars deposited in its vaults via the refiner's bar or melt number. The gold bar list records the bars in accordance with the numbering system used at the respective custodian.

### **7. The current gold bar list may show discrepancies for some bars compared with the previous year. Why is this?**

Both the Deutsche Bundesbank and the central banks where the Bundesbank has gold stored carry out inventory inspections at regular intervals in their storage locations. This involves checking the data saved in the system for each bar, for example its bar number, fineness and weight. If discrepancies are found, the data are adjusted accordingly. Such discrepancies are due to recording errors or technology-related weighing differences.
