The Economic Situation in the Area of the German Federal Republic in August and September 1955

Money and Credit

3

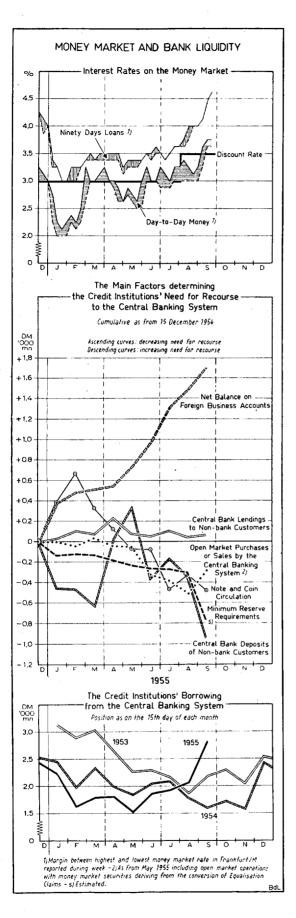

Reduced Bank Liquidity and Tighter Money Market

During the last few weeks the money and credit position has clearly reflected a seasonal tightening and the more restrictive course which the Bank deutscher Länder adopted at the beginning of August when it raised its discount rate and the minimum reserve ratios.

In particular, bank liquidity has been considerably reduced while the money market has become tighter. Even in August the banks as a whole were still able to meet the demands upon them without resorting to the Central Banking System for support; on the average of that month indeed they actually reduced by about DM 70 million in relation to the July figure the amount of credit which they had taken at the Land Central Banks by way of financing their business. The result was -that throughout virtually the whole of August the open market rate for day-to-day money, the relation between which and the official discount rate is usually a fairly reliable indicator as to whether the banks are obliged to have greater or lesser recourse to the Central Banking System, was around 3 $^{0}/_{0}$ to $3^{1}/_{8}$ $^{0}/_{0}$, being thus at times as much as a half per cent below the level to which the Central Bank discount rate had been raised with effect from 4 August this year. In the first few days of September however the picture was already beginning to change. On the open market money was offered in only very small quantity; but on the other hand the demand for money for the purpose of building up the deposits kept by credit institutions in the Central Banking System was so keen that it became possible to meet the additional need only by means of borrowing more at the Land Central Banks, with the result that the credit institutions again became dependent on the Central Banking System to a greater extent. Thus, whereas the amount of credit granted by the Central Banking System to credit institutions normally declines

during the first half of the month, this time, that is to say on 15 September this year, it reached fully DM 2,800 million and was accordingly greater by DM 900 million than on 31 August; and by 23 September, the third bank return date in the month, it had further risen to DM 2.900 million as against less than DM 1,800 million on 23 September last year. Under the influence of the increased importance which thus attached to Central Bank credit as a means of covering the individual institutions' needs for assistance, rates on the open market quickly adjusted themselves to the new official discount rate. In fact, as is usual in periods when the banking system as a whole is obliged to resort to Central Bank credit on an appreciable scale, the rates in the open market have up till now been above the official discount rate by a greater or lesser margin. From 8 September onwards day-to-day loans at Frankfurt on Main usually cost up to $3^{3}/4^{0}/0$; and in the course of the month the rate for money over the end of the year rapidly rose to $5^{1/2}$ % whereas in the corresponding period a year ago it had not in general reached more than $4^{1/4}$ %.

As mentioned above, one of the causes although by no means the only one - of this greater tightness was the raising of the minimum reserve ratios with effect from 1 September this year. According to the latest figures of deposits it is to be expected that the raising of these ratios, together with the increase in deposits carrying the minimum reserve requirement which is likely this month, will have brought the reserves required for September up to about DM 3,650 million as compared with DM 3,150 million in August. The credit institutions have made due allowance for this as early as they could. Indeed, in view of the strains which are to be anticipated in the subsequent course of the month they have already been trying during the early days of September not only to achieve the new requirement but to exceed it by a greater

margin than usual, so that they may afterwards be able to draw on at least a part of the balances thus built up. The result was that on 7 September their deposits at the Land Central Banks reached DM 4,250 million, or nearly DM 700 million more than at the corresponding date in the previous month.

In addition to the raising of the minimum reserve requirement other factors doubtless also contributed towards producing the tightness which occurred in September. Much the most important of these factors was the "big tax date" on the 10th of the month. This led, as it generally does, to substantial withdrawals of funds at the credit institutions as a whole - even though there was again evidence of the difference which can always be seen at such times between the banks that have the benefit of deposits from the Lands and the remainder that have not. On 23 September the deposits of public authorities in the Central Banking System were greater than at the corresponding date in the preceding month by about DM 680 million, which means that to approximately that net extent the credit institutions outside the Central Banking System were obliged by their customers' tax payments to pass funds to the System.

A certain pressure was also engendered by the movement in the circulation of notes and coin. In August this had slightly declined by comparison with July owing to the fall in the amount of holiday travel. In September however it showed a notable rise because the upward tendencies due to the trend of economic activity had been reinforced by similar seasonal tendencies, connected in particular with the increased demand for money on the farms. The consequence was that on the average of the first 25 days of the month the note and coin circulation, at about DM 13.100 million, was greater by DM 207 million than during the corresponding period in August; and there is every likelihood that the end-of-month peak will have exceeded that for August by an even greater margin because this time the last day of the month was also the last of a quarter and, what is more important, it fell on a Friday and thus coincided with the weekly payment of wages.

On the other hand the liquidity of the banks tended to be helped during September by the fact that they were able to offer to the Bank deutscher Länder more foreign exchange than in the previous month. In this way they received about DM 129 million of Central Bank funds in the first three weeks of September, as against only DM 54 million between 1 and 23 August. Even this however was not nearly as much as the DM 229 million of foreign exchange accruing in the first three weeks of July or the corresponding amounts in earlier months.

s form mid-1954 including West-Berlin. — 6) From the changes reported in the holding of Treasury Bills and non-interest-bearing Treasury Bonds the changes in the holding of foreign Treasury Bills have been deducted as well as those amounts which result from the purchase or sale of money-market securities which the Bank deutscher Länder, in pursuance of its new open market securities on this basis does not represent any additional granting of credit. —
Total placings since Currency Reform (20 June 1948). — p) Previsional figures.

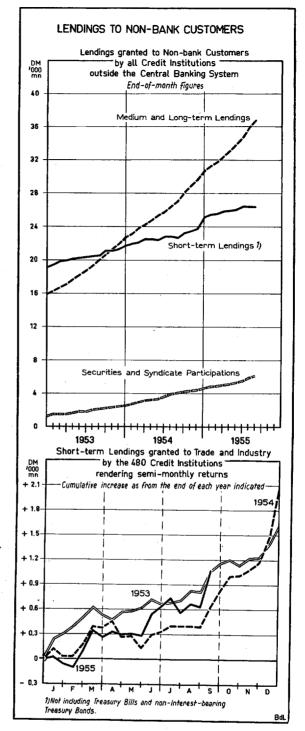

Finally the tendency to greater tightness was doubtless allayed by the fact that during recent weeks the Bank deutscher Länder in the course of its open market operations from time to time took money market securities on a certain scale besides redeeming those which currently fell due. This was first done shortly before the close of August, and continued until about the middle of September. In this way the amount of securities taken reached at the peak about DM 300 million if the maturing Treasury Bills and Treasury Bonds are included. Those taken were for the most part Federal Railways Treasury Bills and Storage Agency Bills; but they also included a certain quantity of other money market securities which the Bank deutscher Länder had acquired in exchange for Equalisation Claims and had passed to public authorities. In the latter case however the securities in question exclusively were Treasury Bills, while the amount of Treasury Bonds that had been placed in the open market was reduced only by the maturing of some of them. The Treasury Bills were taken back in virtue of the undertaking which the Bank deutscher Länder has given, just as - to a certain extent — for the Storage Agency Bills, to purchase them at any time with the object of making them a highly liquid investment suitable for the money market. In order to prevent too free use from being made of this facility for procuring money, however, the Bank deutscher Länder has raised the rates applying to such purchases on several occasions since the beginning of August, so that finally its rate for the purchase of Storage Agency Bills rose for the first time above the official discount rate. Thereafter Storage Agency Bills, which are mostly placed with credit institutions, were hardly offered to the Bank deutscher Länder for purchase at free rates at all, but were presented almost exclusively in the course of normal rediscount business to the Land Central Banks, which took them at the official discount rate.

However, the excesses of out-payments on the accounts at the Bank deutscher Länder serving for the settlement of foreign business, coupled with the Bank's occasional open market purchases, were not nearly enough to cancel out the pressures described above. The result was that bank liquidity was reduced more than it has ever been in the course of recent years, while the money market position was strongly characterised by tightness.

Lendings and Security Purchases of the Banks

As yet however this tightness has produced no clearly discernible effect on the trend of bank lendings outstanding. It is true that according to the monthly statistics there was no further rise during August in the short-term lendings of banks to business and private customers, the rather large expansion in which had given rise to some misgivings especially during the second quarter of this year. On the contrary these lendings decreased in August, although only by the quite trifling amount of DM 12 million, after they had already declined by DM 51 million in July. But the fact that this was merely an interlude, no doubt mainly seasonal in character, is clearly apparent because the increase in such lendings during September has evidently again been very substantial. No comprehensive data for this month are yet available; but at the 480 banks which render semi-monthly returns, and which account for some two-thirds of the total amount of such lendings outstanding, there was a rise of DM 439 million during the first half of September in the short-term credits of that type. Some prudence however ought to be used in assigning meaning to this figure also, because it doubtless reflects in large measure the effect of the need for money resulting from the "big tax date"; and it therefore remains to be seen whether the volume of credit will not have contracted again in the second half of the month. Certainly the expansion during the first half of September was greater than at the last previous tax maturities of importance; and this was so in spite of the fact that in the course of the preceding months trade and industry had received substantial sums as the result of issues of shares and also, as we shall see later, through borrowing at medium and long term.

As yet therefore there has been scarcely any weakening of the tendency for credit to expand. To some extent this may be due to the fact that the demand for credit this autumn appears to be particularly strong not only owing to the underlying economic trend but also for seasonal reasons, especially that it is necessary to finance

a harvest greater than any previously collected in Western Germany. In addition there is no doubt that the banks, disregarding the pressure on liquidity to which they are at present subject, are in many cases not refusing to meet the desires of trade and industry for credit — this being because they had previously given their customers promises of credit which now have to be redeemed. It would however be over-hasty to conclude from this that the measures of credit policy adopted at the beginning of August were "ineffective", since it is precisely in view of promised credit lines of this kind, as well as for other reasons, that steps designed to make credit scarce always need a certain time before they can produce their full effect.

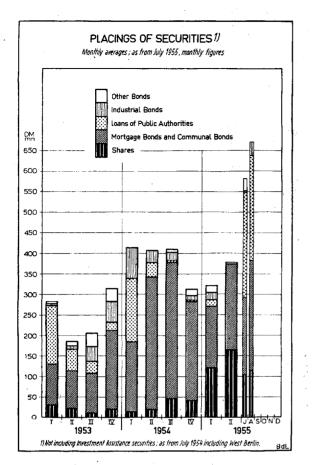

During the period under report there was also further growth in the credits at medium and long term granted by credit institutions, including the mortgage banks and savings banks. In August, the last month for which data are to hand, the increase in such credits amounted to DM 924 million as compared with DM 916 million in the previous month, and a monthly average of DM 683 million for the first half of this year. By comparison with August of last year, when the total rose by DM 634 million, the increase in the rise was also clearly marked. In this field it was impossible to expect any prompt reaction to the steps taken in connection with credit because these lendings, so far as they do not merely represent the transmission to borrowers of sums lent by public authorities for capital purposes subject to 'a joint commitment on the part of the banks, mostly consist of loans granted against real estate by mortgage banks and savings banks; and promises to grant these will in most cases have been given well beforehand, while the lending institutions will also have been holding the funds available for a considerable time, especially where they are issuers of mortgage bonds and communal bonds. It may even be that the measures taken in connection with credit actually hastened the expansion in the case of these lendings, because the borrowers now have to reckon with the prospect that interest rates will if anything rise for loans of this sort also; and they are therefore likely to be interested in borrowing at an early date, whereas they were previously inclined rather to do what they could to postpone the taking of funds at medium and long term in view of the falling trend of interest rates. Incidentally it is usual for the amount of borrowings at medium and long term to show a greater seasonal rise in the autumn because, as the building season advances, the proceeds of mortgage loans are paid to borrowers on an increasing scale.

It is rather more noteworthy that in August the security holdings and syndicate participations of credit institutions also showed further growth. True, the addition of something over DM 150 million was nothing like so large as that of DM 414 million which, as stated in the last Monthly Report, took place in July; and it was also somewhat smaller than the monthly average for the first half of this year. The falling off in the rate of increase indicates that even in August, out of regard for the change in the direction of credit policy which took place at the beginning of that month, many institutions were already making their arrangements somewhat more cautiously than before. Indeed there seems altogether to be fresh confirmation of the fact that the banks are often quicker to react to changes in their liquidity by action in regard to their investments in securities than in their lending business. Certainly the banks' buying of securities was still being assisted in August by the fact that up till then their liquidity had hardly been impaired at all but on the contrary, for reasons that were described in the last Monthly Report, actually showed a certain improvement. The picture seems however to have been completely altered by the restriction of the banks' liquidity which, as described above, occurred in September. True, it remains to be seen whether the banks on balance sold securities in that month with a view to procuring funds. But it certainly looks as though they had further limited their buying of securities. The effect produced by this on the capital market is likely to have been all the greater because other investors too have recently been showing themselves distinctly cautions in this respect. Further details on this subject will be given in the sections that follow.

Security Markets

In August the security markets were as yet comparatively little affected by the change in the monetary situation which was gradually becoming apparent. In that month the placings of securities, excluding the allocation of those relating to the Investment Assistance, amounted to DM 672 million; and this actually exceeded the July total by nearly DM 90 million in spite

8

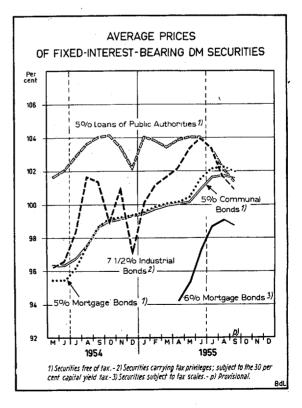

of the fact that share issues, and therefore share placings, were of only about the same size as in the previous month. As to details, fixedinterest-bearing securities were sold to a par value of DM 557 million and shares to a par value of DM 115 million, the total values at sale price being DM 545 million and DM 121 million respectively. Of the fixed-interest-bearing securities, still at par value, DM 268 million or 48 per cent were mortgage bonds and communal bonds: DM 256 million were the loans of public authorities that were mentioned in the last Monthly Report, comprising DM 125 million for the Federal Postal Administration, DM 75 million for Berlin and DM 56 million for the Land of Lower Saxony: and finally DM 33 million were convertible bonds of an electricity supply undertaking, the whole of which were taken by large shareholders who were in fact public authorities. The level of prices moreover was for the time being affected only slightly in August, even on the markets for fixed-interestbearing securities, by the already considerable rise in short-term interest rates. In the main,

9

price falls of a pronounced kind occurred only in the case of those public loans which have largely the character of money market securities, as well as in the case of certain industrial bonds, while quotations for mortgage bonds and communal bonds were marked down only slightly if at all — although, in the case of some newly issued securities, it was already necessary to allow somewhat higher commissions to intermediaries.

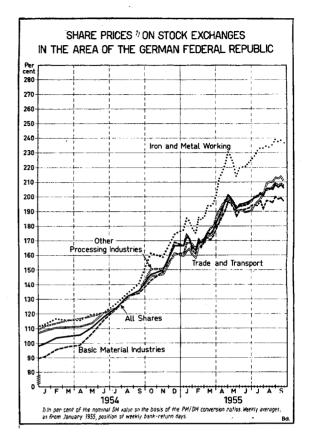

In September however the downward pressure became stronger in all sections of the market. The 5 %/0 tax-free loans of the Federal Government and the Lands, which serve mainly as a vehicle for the employment of money, suffered further price-falls of 1/2 to $1^{1}/2$ points, which brought them in most cases down to $101^{1/2}$ to $100^{1/2}$, while in a few cases securities of this kind were actually forced down to the parity level. Even the industrial bonds carrying tax privileges and higher rates of interest dropped a further 2 to 3 points and approached their redemption prices, most of which are above par around 101 to 103, while in a few cases they actually dropped below the redemption level. In a number of instances the $6^{1/2}$ % industrial loan bonds which had been distributed to Invest-

ment Assistance creditors about the middle of this year were offered at prices of up to 4 per cent below their issue price, that is to say at only 93 per cent of par. On the mortgage bond market tax-free issues were in particular under pressure. Dealings took place in them in considerable quantities at 101 to $102^{1/2}$, or 1 to $1^{1/2}$ points below their previous peak level.

In view of this state of affairs it has understandably also become more difficult to place new fixed-interest securities bearing tax at the normal rate. Thus it has been necessary to postpone fulfilment of the desires of one Land, which wished to place a $5^{1/2} \frac{0}{0}$ loan at 98 and so to continue the series of public issues that had begun in July, because the bank syndicate in charge of the issue felt that placing of the bonds was no longer assured on these terms. There has also been, for the present, a considerable drop in the demand for new mortgage bonds and communal bonds. Those at 6 % find takers the most easily, although it is true that in most cases it remains necessary to allow the banks increased commissions of 1 to $1^{1/2}$ per cent, so that in such cases the net price to the seller is only 98 to $97^{1/2}$. On the other hand sales of the new $5^{1/2}$ % issues have largely come to a standstill In order to start them moving again certain issuing institutions have in practice reduced the net selling price to $93^{1/2}$ by increasing the commissions to rates ranging up to $2^{1/2}$ per cent. Most of the institutions however refuse to pay a commission of over $1^{1/2}$ per cent, because they regard it as a concealed lowering of the issue price, and therefore prefer for the moment to refrain from selling securities of this type. Still, the issuing institutions have by no means abandoned the 51/20/0 mortgage bond. In August the amount of $5^{1/2} 0/0$ securities for which approval was granted, namely DM 305 million, was more than three times as great as in the case of those at 6%, and in the first three weeks of September a further DM 160 million of $5^{1/2}$ % issues were proposed and approved as against only DM 41 million at the 6 % rate.

Business in mortgage bonds, and the other sections of the capital market, have also been characterised of late by a certain tightness. In general the rates of interest for loans by private treaty, granted mainly by insurance companies,

have again risen to around 7 % after having declined from about $7^{1/2}$ % at the beginning of this year to 6^{1/2} % in the summer. The mortgage banks are also in many cases already making allowance, in the terms for the loans that they grant, for the rise in their costs in the shape of the interest payable on the funds which they procure. They are doing so mainly by reducing the percentage rates of payment to borrowers, after these rates had in most cases been slowly but steadily raised during the preceding months. It has already been mentioned that in these circumstances the demand for funds on the mortgage market has become noticeably stronger because, at the moment, the parties engaging in building projects hardly expect any longer to gain anything by an attitude of "wait and see". Of late however trade and industry also have increasingly been asking the mortgage institutions for loans because, as it seems, they fear that credit may become still dearer and therefore they wish more than before to consolidate their bank borrowings and obtain resources at longer term. In general however, owing to other commitments, the mortgage banks are able to

meet this demand only to a limited extent quite apart from the fact that, as mentioned above, their terms also are at the moment showing a clear tendency to become stiffer.

This tendency in the capital market, which many people find disappointing, is unmistakably connected with the tightening of the money market and the rise in short-term interest rates. This connection is mainly due to the fact that private long-term investors, whose arrangements remain relatively unaffected by variations in the money market, are at present still an element of only small importance for the placing of securities, with the result that the market continues in the main to depend on institutional investors. Among these latter however the dominating element up till now has been the credit institutions, because a large part of the capital formed within the country was reflected on bank accounts - while the tax privileges which the Capital Market Encouragement Law established for a large category of securities have moreover made securities a favourite object of investment for many banks. In the first eight months of this year credit institutions actually took nearly DM 1,600 million or about 55 per cent of at least the initial placings of securities carrying fixed interest rates, as against DM 1,460 million or 42 per cent in the corresponding period of last year. As to the remainder, only 18 per cent went to public authorities, chiefly the Social Insurance Institutions; business enterprises took 23 per cent: and private purchasers had a mere 4 per cent. It is true that these figures, as already stated, represent only the initial placings. In all probability as the result of subsequent sales the proportion actually going to the banks will have fallen, while that going to other groups of takers and to private investors in particular will have risen. But this has not brought about any fundamental alteration in the general picture because according to the monthly banking statistics, which in practice cover all the credit institutions that matter from the point of view of taking securities, the banks' holding of fixedinterest-bearing securities rose from not quite DM 4.000 million on 31 December 1954 to about DM 5,200 million on 31 August this year; this rise however was only by about one-fifth

smaller than the proportion of total placings which went to the banks according to the statistics of first takers. In view of these relationships it is not surprising that on the market for fixed-interest-bearing securities appreciable downward pressure on prices at once began when, as indicated above, the banks were affected by the considerable restriction of their liquidity in September and became at least more cautious — especially since other institutional investors would seem to have acted in a similar way.

The Board of Directors of the Bank deutscher Länder was of course reckoning with this secondary effect when at the beginning of August it decided, for the reasons outlined in the last Monthly Report, somewhat to tighten the reins in its conduct of credit policy. It based this decision on its conviction that in the long run a sound monetary policy is an indispensable element for a favourable development of the capital market as well. The point indeed is that in the last resort a lowering of the rate of interest for capital, for which many people rightly hope on a longer view, depends entirely on whether the formation of savings capital increases more rapidly than investment activity, and whether the market consequently succeeds by degrees in bringing interest rates down. It cannot however be expected that the formation of savings capital will move in this way in relation to investment if doubts arise as to the stability of money, since in that event the recipients of income will inevitably save less, while enterprises will tend if anything to invest more. Essentially therefore, when decisions are taken on credit policy, it is necessary even in the interest of the capital market to treat maintenance of a stable value of money as more important than any supposed regard for the needs of that market, even though some adverse repercussion on the capital market may have to be accepted as the immediate result.

Apart from this, many people are regarding the present repercussion from a much too pessimistic angle. As to the immediate effects on the trend of economic activity it must in the first place be borne in mind that from the point of view of economic trends tightening of the capital market really presents danger only if investment is less than normal, or if it threatens within a

measurable period of time to sink below the level which appears necessary for the maintenance of an appropriate overall level of activity. Neither of these two conditions is however now present. On the contrary, investment activity is if anything now tending in a general way to rise above the level which must be regarded as sound in the light of the existing limits to capacity. Admittedly it is not possible to draw from this without further qualification the conclusion that the level of the rate of interest on capital up till now was already to be regarded as being too low from the point of view of the function of that interest rate as a regulator of investment, because it is well known that investment has to be in particular regarded as excessive wherever capital is procured not on the basis of normal market costs but with the help of public subsidies or tax concessions. On the other hand however it cannot be denied that the amount of investment is also relatively large even where it is not being assisted by favourable treatment of these kinds. A slight raising of the rate of interest for capital will therefore certainly not "break up" economic activity, but will on the contrary merely contribute towards curbing the extent of investment in the way which in many directions is thoroughly desirable, and will therefore help to stabilise the level of economic activity. It goes without saying indeed that it could only be desirable that public investment expenditure be spread out in the way that has been recommended for years past in these Reports, thereby making it possible to restrict within the narrowest possible limits the use of measures of credit policy which inevitably always act to some extent in overall blanket fashion.

Finally account must be taken of the fact that the present situation in the capital market need not at all represent any fundamental change in the direction of its longer-term tendency, but may well on the contrary be replaced after only a comparatively brief interval by fresh relaxation. Many of the features in the present tightening of the market can indeed certainly be regarded as being of a passing nature. This especially applies to the reserve which some of the institutional investors in particular are imposing on themselves in view of the possibility that further measures of credit restriction might be applied. When the supply of capital is reduced for reasons of this kind, experience shows that after a certain time the shortage will be replaced by an urge to invest that will be all the stronger. The main point is that the propensity to invest is likely to grow once more as soon as it becomes clear that it will be possible to dispense with further restriction of credit because the danget that the boom might be overdone is disappearing. When that happens, the course of events in the money market too will no doubt again favour the easing of the capital market. If of course the nature of the trend, or to be more precise the need to keep the price level stable should entail further action against a boom, then it would on the contrary be necessary to expect further disturbances for a time. But in that event it would probably be even more obvious than it is now that so-called regard for the capital market must not prevent the taking of steps of this kind when they are required in the general economic interest - the more so since a low rate of interest oncapital is not an object in itself, but is desirable only if it has not to be bought at the price of a monetary policy that is too liberal from the point of view of general development of the economy.

The Formation of Savings Capital

Incidentally, if it should be found that no further tightening of credit policy is required, some revival of the tendency for interest rates to fall must be expected - even though that tendency may be initially only slight — if only because there is every indication that up till now the formation of savings capital has remained virtually unaffected by the signs of strain which have appeared in parts of the economy. With the rise in private incomes and business profits the size of savings has in fact continued to grow. A statistical index which can be used as a shortterm indicator of this is in particular that of the movement in savings deposits at credit institutions. In August the total of these, including those at the Postal Savings Bank, rose by DM 277 million as compared with DM 191 million in the previous month and a monthly average of DM 279 million in the second quarter of this year. If one disregards the amounts credited in

virtue of compensation legislation and also the withdrawals of such compensation monies as estimated by the credit institutions, then the increase is even a little greater than that. This fact is the more noteworthy because there is little doubt that in August savings activity was still being impaired to a comparatively large degree by holiday travelling, while moreover in that month reluctance to invest in securities was certainly not yet a factor. In addition, in view of the increasing desire of large groups of the population to possess their own home, larger and larger amounts of savings have been flowing into the building and loan associations - the addition to whose deposits is not included in the figures quoted above - or are being lent out as private loans to relatives and acquaintances.

In August, the last month for which statistics can be had, there was also further growth in *time deposits*, which rose by more than DM 200 million after having fallen by nearly DM 600 million in June and July. Now it is doubtless correct to say that this increase cannot be described without further qualification as "formation of capital", because experience shows that large sums are accumulated on time deposit

accounts which are in fact placed there by the depositors only for a brief period, after which they are used. As is well known, reserves against taxation are of special importance in this connection, that being incidentally why it is by no means rare for time deposits to grow just before one of the major tax maturities and then to fall off again in greater or lesser degree. It is also clear that the formation of reserves against the tax payments falling due in September largely accounted for the growth of time deposits in August. A further contributing cause however is likely to have been that even in August many institutional investors were already buying less securities than they would propably have bought but for the adverse influences on the bond market that have already been described; and in September also the slight reduction in the demand for securities would seem to have had a certain counterpart in the fact that the movement in time deposits was relatively favourable in spite of the "big tax date". Evidently therefore there is proceeding an accumulation of funds which could rapidly benefit the capital market, once the pressure to which that market is at present inevitably subject becomes less strong.

Public Finances

The cash position of the public authorities as a whole, although considerable divergence is shown in individual cases, continues to be characterised by relatively high receipts which in general are rising further. At the same time their expenditure still remains for the time being less than had been expected in the light of the large sums voted for defence on the Federal budget. Especially in September, with its "big tax date", this tendency has again been clearly apparent. On all budgets taken together it would seem that in this month cash surpluses were achieved which not only offset but appear even to have outweighed the deficits that had been incurred in some cases in the two preceding months with their smaller tax revenues.

Tax Revenues of the Federal Government and the Lands

In August 1955, the last month for which figures are available, the total tax revenues of the

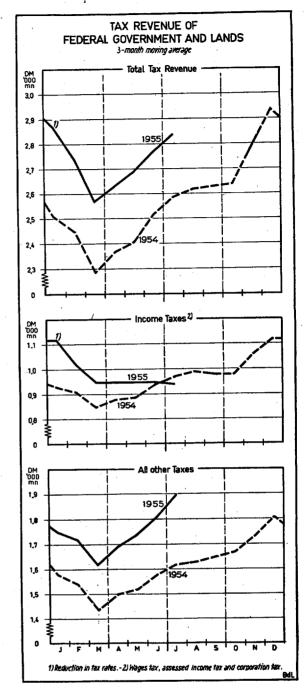

Federal Government and the Lands were again some 10 per cent higher at DM 2,509 million than in August of last year. At the same time there has been, at least temporarily, a further increase in the tendency mentioned in recent Monthly Reports for the yields of the various taxes or categories of tax to move in different ways. By comparison with a year earlier the proceeds of the Assessed Income Tax and the Corporation Tax together declined further, this being due to the fact that in August the final payments in respect of earlier years evidently declined in amount even more than in the previous months, while up till very recently certain adjustments of current payments to the new rates of tax were still being made. On the other hand the yield of the Wages Tax continued to be considerably greater than in the corresponding period of last year. It is true that here again the effect of the lowering of rates of tax

has been making itself felt more strongly during the last few months than it was doing in the spring, the reason being that the new allowances have been entered only by degrees on tax cards, with the result that in some cases the overpayments collected during the early months of the year have been cancelled out by reimbursements. These factors have however been more than offset by the continuing vigorous increase of incomes in the form of wages and salaries, the effects of which increase on the yield of taxation have been appreciably magnified owing to the progressive scale of the Wages Tax. It is however worth remarking that even in August these additional receipts were not large enough to make good the shortfalls that occurred in the case of the Assessed Income Tax and the Corporation Tax. The result was that in August the total proceeds of the three Income Taxes still remained lower than that of a year earlier by more than 10 per cent.

On the other hand the taxes which have not been lowered, and which accounted during the past financial year for some two-thirds of all the revenues from taxation, have continued to show strongly rising yields. By comparison with the corresponding period in 1954 the amount accruing from these taxes in August was up by 19 per cent, as compared with a similar increase of 14 per cent in the first quarter of this financial

year. Apart from the rise in receipts from the Turnover Tax a factor which has been especially important of late in this connection is the large increase in receipts from Excise and Customs Duties. In addition to the increase corresponding to the economic trend, as resulting from rising imports and from the fact that for some time past the consumption of beverages and tobacco has evidently been fairly rapidly growing, the chief reason for this movement was the rise which

came into force at the beginning of May in the rates of tax on diesel oil and petrol. In August the receipts from the Mineral Oil Tax were greater by DM 43 million or about 60 per cent than a year earlier, as compared with corresponding increases of only DM 9 million or 20 per cent in April, the last month before the coming into force of the Transport Finance Law. The total yield of taxation in August was clearly also affected by the increases in rates which were applied during recent months to the Transport Tax, the Motor Vehicle Tax and the Berlin Emergency Levy. At all events the yield of the "other taxes" for which individual data are not available (see item 7 in the table) was higher by about 37 per cent than a year earlier.

The Federal Budget

As a result of the large receipts from taxation, and of the fact that the rise in expenditure is for the present still small, the Federal budget in particular evidently continues to form cash surpluses although in the individual months, according to the timing of tax payment dates and the irregularity of the intervals at which some items of expenditure fall due, there have been fluctuations of greater or lesser extent in the respective results. In August for example the Federal budget showed a cash deficit of DM 99 million, whereas in September it may be expected mainly on the ground of the large

amount of tax monies falling due to produce a surplus, which is likely to be equal to several times the August deficit. This latter deficit was due to the fact that in that month, in accordance with the usual recurring trend, the cash receipts were smaller than in the two previous months, whereas on the other hand owing to special charges the cash expenditure reached a particularly high level at DM 2.055 million. In the first place a total of DM 95 million had to be provided for external debt service owing to repayments of British post-war economic aid. Furthermore, apart from the usual monthly grants to the Social Pension Insurance Funds, the Federal Government reimbursed DM 132 million under Article 90 of the Federal Law on Pensions to War Victims¹), the effect being that the whole of the liabilities which had accrued under that head since the beginning of the financial year have been met. And finally, as a result of the payment of amounts in arrears, grants to the Equalisation of Burdens Fund were much higher at slightly over DM 40 million than the average monthly instalment of DM 11 million which had been laid down for the current financial year. On the other hand the amount of liabilities currently accruing, at not quite DM 1,800 million, was little greater than in the preceding months; and the increase was

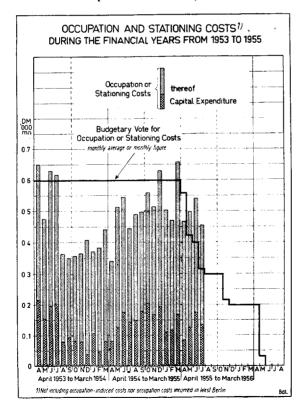

¹) This provides that the Federal Government is to repay to the Pension Insurance Funds established by law their additional expenditure arising from the fact that claims deriving from insurance matured unduly early owing to war damage.

Cash Position of the Federal Budget¹) (In millions of DM)

also comparatively small in relation to August of last year, when current expenditure had amounted to some DM 1,720 million after deduction of the expenditure on external debt service and on redemption of the Federal loan that had been placed with the E.R.P. Special Fund. The increase in question would seem to have been mostly confined to the expenditure for social purposes, which has been clearly growing since the start of the year, mainly owing to the rise in the scale of pensions to war victims and in the amount of grants to the Miners' Pension Insurance Fund.

The fact that the expenditure under other heads remained largely stable was almost entirely due to the circumstance that expenditure on the establishing of German defence forces has not yet begun, while the sums spent out of Federal resources on the stationing of contingents of foreign troops in the German Federal Republic during recent months have been if anything below the level which they reached last autumn and winter. In July, the latest month for which data are to hand, the stationing costs reached DM 454 million; and their average of not quite DM 490 million per month for the first four months of the present financial year was also less

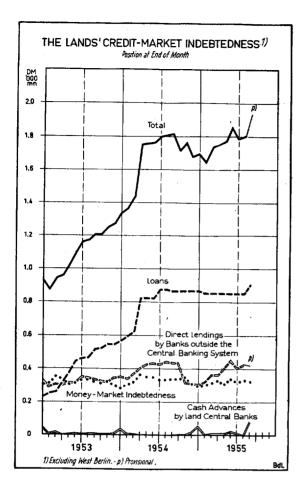

than the monthly average of DM 555 million for the second half of the financial year 1954/55. It is true that in July, just as had already happened in May and June, such expenditure exceeded the amount that is currently made available out of Federal funds to cover stationing costs; this was because, as has been stated in earlier Reports¹) and as can be seen from the graph, that amount is continuously decreasing. In July it was no more than DM 317 million, and in December it will drop to DM 200 million. From the start of the financial year up to and including July the total expenditure on occupation and stationing costs was greater by DM 258 million than the sums voted for those months; and therefore the "carry-over" of voted occupation costs which had arisen in previous financial years, and which amounted at the end of March this year to DM 4,020 million, has now been reduced by the DM 258 million mentioned. The overall cash position of the Federal Government was however not impaired by this decline in the carry-over, because at the same time a fresh "carry-over" was formed in respect of the expenditure for purposes of Western Germany's own defence.

The Budgets of the Lands

During the last few months the cash position of the Lands has been under some strain, more especially since it would seem that the surpluses attained in September, when tax revenues are large, hardly sufficed to cover the deficits of the two preceding months. One indication of this can be seen in the movement of the Lands' cash holdings. At the end of August in fact the liquid funds of the Lands (not including West Berlin) held in or invested through the Central Banking System, at about DM 500 million, were lower by fully DM 200 million than at the end of June. According to the figures so far available it is doubtful whether this decline was made good in September. In addition there has probably been no further rise but a fall during recent months in the still substantial deposits which the Lands keep at credit institutions outside the Central Banking System since, although no accurate statistical breakdown of the figures is available, the increase in total public deposits at credit

¹⁾ See the Monthly Report of the Bank deutscher Länder for June 1955, page 18.

institutions was only small, and at least the whole of it would seem to have been due to the rise in cash holdings of the Social Insurance Institutions. There has moreover been a notable increase during the last two months in the credit market indebtedness of the Lands; this followed on a period of more than a year during which, as the graph shows, that indebtedness had remained virtually unaltered. In August alone it increased by about DM 125 million, of which a loan for the Land of Lower Saxony accounted for DM 56 million. While there was at the same time a slight decrease in their money market indebtedness, the amount of credit taken by the Lands of Bavaria, Schleswig-Holstein, Hesse and the Rhineland-Palatinate from their Land Central Banks rose by some DM 88 million. This is remarkable because for three years the Lands had required practically no credit from the Central Banking System. The effect was that by the end of August the total credit market indebtedness of the Lands had reached an amount of about

DM 1,935 million¹); this comprised DM 912 million of market loans and interest-bearing Treasury Bonds, DM 326 million of money market securities and some DM 420 million of credits extended by banks outside the Central Banking System. The remainder consisted of cash advances from the Land Central Banks and of loans by private lenders against recognisance of debt in various forms.

This slightly strained condition in the finances of the Lands is mainly due to the comparatively large increase in their expenditure, which for a large part they were unable to evade. Thus in the first place the effect of the Fourth Law for Amending the Equalisation of Burdens Law was to fix at a higher level than previously both the grants to be made by the Lands towards Maintenance Assistance and also the sums to be transferred out of proceeds of the Property Tax. Whereas for example during the past financial year the Lands were required in practice to make available for purposes of the Equalisation of Burdens Fund only 50 per cent of their total Property Tax receipts, the proportion to be paid over has been raised to 90 per cent as from the current financial year. Since this Law was not promulgated until July, the Lands were in addition compelled during the last two months to meet payments of arrears in respect of the first quarter of the financial year. Besides this the position of the Lands has deteriorated to an estimated extent of DM 420 million per year or DM 35 million per month owing to the enactment of the Law for Regulating Financial Relations between the Federal Government and the Lands (the Fourth Transitional Law²); the deterioration is mainly due to the fact that since the start of the financial year the Lands alone have been bearing the costs of tax administration, and that they have been required to carry larger quotas of the Federal Government's expenditure on certain social purposes. Furthermore, as a result of the increase in rates of wages and salary that were put into effect last autumn the level of expenditure on personnel is also higher than a year ago. To some extent however the upward movement in expenditure may in

The figures relate to the area of the German Federal Republic excluding West Berlin. Data for West Berlin are contained in Table XI/6, which is published in the Statistical Section of this Report.

addition be due to the fact that the Lands have been spending more on capital projects, although detailed statistics on this point are not yet available.

Besides all this the course of the Lands' receipts has been less good during the last few months than it was even in the first quarter of the current financial year. It is true that the Lands have paid over to the Federal Government a considerably smaller share of the total proceeds of the Income Taxes than they did during the financial year 1954/55. No legal arrangement on this point has yet been reached. While the Federal Government has asked for the raising of its share from 38 to 40 per cent, the Lands on the other hand have pointed to the additional expenditure which as mentioned above has arisen for them as a result of the Fourth Transitional Law, and have requested that the rate be lowered to $33^{1/3}$ per cent. Meanwhile it appears that the amounts paid over have varied not only as between one Land and another but also from month to month. The figures published in the Federal financial statistics show that the Lands as a whole made payments in July at the rate of 34.8 per cent as compared with a monthly average of 33.7 per cent in the first quarter of the financial year. Since however as already mentioned the yield of the Income Taxes was considerably down during the last two months, the position is different from that in the first guarter of the financial year inasmuch as the reducing of the Federal share has recently no longer quite sufficed to keep up to the previous year's level the part of the total proceeds remaining to the Lands. It is true that the amounts accruing from the other taxes of the Lands have continued to grow. On the average however these account for less than a third of the Lands' revenues derived from the Income Taxes; and besides this, in the case for example of the Property Tax and the Motor Vehicle Tax, a substantial part of the proceeds has to be used to provide contributions to the Equalisation of Burdens Fund and for capital expenditure on roadmaking respectively.

The Equalisation of Burdens Fund

The recent position of the Equalisation of Burdens Fund has been characterised by the fact that the deficits have remained within narrower

limits than it was necessary to expect even a few months ago. If one leaves out of account the proceeds of the DM 250 million loan that was issued in July this year, the expenditure during the period of three months from June to August exceeded the receipts by less than DM 70 million as compared with some DM 195 million in the previous three-monthly period from March to May. The result was that, with the loan proceeds included, the cash resources rose from DM 197 million at the end of May to DM 378 million at the end of August. This increase is due in the first place to the fact that of late the receipts of the Equalisation of Burdens Fund, apart from what accrued from the loan, have been greatly enlarged by contributions from the Federal Government and the Lands, these having been raised with retroactive effect from 1 April this year in pursuance of the Fourth Law for Amending the Equalisation of Burdens Law, which was enacted in July. In August the Equalisation of Burdens Fund received about DM 160 million under this head in cash; and in addition the amounts received from the levies reached the especially high level of DM 338 million as a result of the quarterly payment date.

There is the further point that for the time being the expenditure has not attained quite the size which was expected at the time when this year's Economic and Financial Plan was drawn up, this being mainly due to a presumably only temporary decrease in the sum spent on Household Equipment Assistance. The total expenditure in August reached only DM 290 million; and for the three months from June to August inclusive the total of DM 935 million fell a good deal short of the high level reached during the winter months of last year. In September too the rise in expenditure would seem to be no more than comparatively slight, so that the cash deficit which is in itself normal in that month is likely to remain within relatively narrow limits. The result should be that the Fund will have a comparatively large cash holding with which to enter the fourth quarter of the calendar year, when appreciably larger deficits may again be expected; and this ought to make it possible further to postpone for the present the issue of the proposed third loan of the Equalisation of Burdens Bank.

On 31 August of this year, incidentally, three years had passed since the Equalisation of Burdens Law came into force in replacement of the 1949 "Immediate Assistance" scheme and the Equalisation of Burdens Fund started its activity in the present form. During that period the Fund has made available a total of DM 10,560 million for the various forms of compensation or assistance contemplated in the Equalisation of Burdens Law, while the amounts so made available have risen from year to year. During the last year of this period, running from September 1954 to August 1955, the position differed from that in the first year inasmuch as the productive expenditure became more prominent. This applies in particular to the Rehabilitation Loans, on which DM 966 million were paid out as compared with only DM 143 million in the first year. In spite of this a sum of more than DM 900 million was still applied during the last year to Household Equipment Assistance, the expenditure on which had been greatly speeded up during 1952 and 1953 to compensate for the fact that the amount used for Rehabilitation Loans was at the outset growing only slowly. Since at the same time pension payments took more as a result of the improvement in scales that was introduced in July 1954, the absolute amount of expenditure for purposes of

As a result, for some considerable time now the Equalisation of Burdens Fund has been able to handle this volume of expenditure only by resorting to borrowing on an increasing scale to supplement its current receipts - this being in spite of the fact that its ordinary receipts have also risen to a considerable extent. At the end of August this year the indebtedness of the Equalisation of Burdens Fund stood at over DM 1,100 million, of which DM 659 million had been incurred in the course of the preceding year. If the programme of expenditure for the current financial year¹) is fully carried out, then by 31 March 1956 the Equalisation of Burdens Fund would have to borrow a further sum of about DM 400 million – which does not allow for the sum required to repay the stopgap loan of DM 300 million that was taken in April from the Federal Government. It has been repeatedly shown in these Reports that expenditure on this scale would largely offset the surpluses achieved in other budgets, and would thereby reduce the effect of those surpluses in slowing down the general expansion of demand.

Budgets of the Local Authorities

At the moment the local authorities also are borrowing comparatively large amounts for the purpose of covering their expenditure. At the end of July, this being the latest date for which figures are to hand, the local authorities' indebtedness other than loans taken from other public authorities stood at an estimated total of DM 4,000 million, as compared with some DM 3,900 million at the end of June and roughly DM 3,600 million at the close of the past financial year. Much the greatest part of this total, in fact nearly 90 per cent, took the form of medium and long-term bank loans which had been granted, largely out of the proceeds of communal bonds, by institutions engaging in mortgage loan business. As against this the amount of only DM 70 million for which the local authorities had themselves issued loans so far was comparatively modest. The remainder consisted of short-term borrowings from banks together with loans taken from private lenders against recogni-

¹⁾ See the Monthly Report of the Bank deutscher Länder for July 1955, page 16.

sance of debt, both these items being of only small size.

The comparatively large extent of this recourse to borrowing is the more noteworthy because of late the ordinary receipts of the local authorities have considerably risen. During the first quarter of the financial year, running from April to June 1955, the proceeds of the local authorities'

taxes reached DM 1,220 million¹), as compared with DM 1,074 million in the corresponding period of the previous year. The ratio of increase was thus about 14 per cent, and was even greater than that for taxes of the Federal Government and the Lands. The chief cause was the movement in receipts from the Trade Tax, which at DM 840 million were greater by DM 132 million, or nearly 19 per cent, than a year before. The increase would have been amply sufficient to cover the rise in ordinary expenditure, because during the first quarter of the present financial year the estimated expenditure of DM 880 million on personnel — which accounts for the larger proportion of the ordinary expenditure - exceeded that in the corresponding period of the previous year by only about DM 60 million, while it would seem that the percentage rise in administrative expenditure on material was if anything even smaller. In nearly all cases however substantially more was spent on capital purposes. From partial data relating to the local authorities' finances it certainly seems safe to conclude that even during the first quarter of the current financial year the local authorities' capital expenditure of about DM 780 million was already some 16 per cent greater than in the corresponding period of 1954/55. The growth in the ordinary receipts was however not large enough to cover this additional spending. In order to finance the uncovered balance, it is true, there was a certain amount of resort to loans from the Lands earmarked for special purposes; but in addition, as mentioned above, a substantial amount of borrowing at credit institutions was also unavoidable. A large proportion of the sums thus borrowed was spent on building. So long as the strains which have been recently observed in the building market persist, however, it is desirable that the local authorities in the same way as all other public authorities should henceforth show a certain reserve in connection with such capital expenditure — the object being to counteract so far as possible any further overdoing of the boom in capital investment, and especially in the building trade.

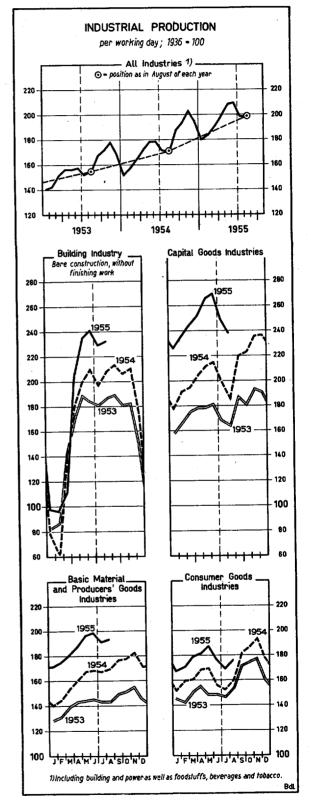

¹) Excluding Hamburg, Bremen and West Berlin. Totals which include the figures for these will be found in Table XI/9 in the Statistical Section.

Production and Markets

The economic trend continues in general to be determined by strong upward tendencies; but for the time being, apart from individual branches of activity, the strains which have now been present for a somewhat lengthy period have become no greater. It is particularly noteworthy that during the last few weeks prices on a general average have scarcely risen any further; on the contrary, at least in some cases where they had previously risen, they have declined again under the influence of seasonal tendencies. However, the fact that large increases continue to be made in wages, and that in many directions demand still exceeds the possibilities of production, is causing the appearance of great instability in the situation to persist.

Production

The chief reason why the position has up till now not become any more difficult is that industry has been successfully trying continuously to increase production and also, more especially, to rationalise it, the object being to use improved technical efficiency as a means of at least partly escaping the effects of the bottleneck in the supply of labour. The tendency for output to rise is however for the most part reflected in the more recent figures of production only in the fact that the holiday season and the withdrawal of labour for harvest work, contrary to what has taken place in many other years, did not reduce the level of industrial production in August this year more than in July but did so, if anything, to a lesser extent. The result was that even in August the index of production in industry showed a slight rise in spite of the fact that no large upward movement can normally be expected until September. In some branches of activity moreover there is an unmistakable tendency towards the engagement of productive capacities which hitherto had been less fully used because demand was predominantly directed towards other goods, which however can no longer be obtained in the quantities desired. As regards the output of building materials for example the production of sandlime bricks and of pumice and concrete bricks has been greatly expanded this year because in that industry free productive capacities were still available, and because the products in question are now being used on a larger scale owing to the shortage of other building materials.

Above all however the further extension of output is being assisted by the large capital investments which have been effected during the last two years, especially since a large part of the projects in question have been for the purpose of rationalisation and so reduce the extent to which enlargement of output depends on the state of the labour market. During the first half of 1952 the "investment ratio" or, to put the matter into concrete terms, the share taken in the use of the national product by gross investment in fixed assets reached 18.6 per cent; but in the first half of 1954 it had already risen to 19.8 per cent, and in the first half of 1955 it rose further to 21.5 per cent. The table which follows shows the movement which took place, under the influence of these large capital investments, in production and more particularly in the output per employed person: this latter is of course not identical with productivity, but does provide some indication of it. According to the

table between the first half of 1954 and the first half of 1955 the ratio of growth in the national product, in the sense of the gross domestic product at constant prices, amounted to more than 10 per cent as against less than 8 per cent between the first half of 1953 and the first half of 1954, and only about 6 per cent between the first half of 1951 and the first half of 1952. The greater part of this increase was due to the improvement of productivity, because the number of persons employed in the first half of 1955 was greater by only 4.3 per cent than in the

corresponding period of the previous year, so that the output per employed person rose by approximately 6 per cent: this compares with 4.6 per cent between the first half of 1953 and the first half of 1954, and only 3.1 per cent between the first half of 1952 and the first half of 1953. In the first half of 1955 therefore the rise in productivity by comparison with a year earlier was almost twice as great as it had been only two years earlier; and there is little doubt that this result was due not only to the greater degree to which existing capacities are by now being used, but mainly to the capital expenditure on rationalisation during recent years.

Still, the fact must not be overlooked that even in the first half of 1955 more than 40 per cent of the rise in production as compared with a year earlier rested on the basis of an increase in employment. On the average of that period the number of persons employed was 900,000 greater than in the corresponding period a year earlier. Of this total about 650,000 represented the afflux of new recruits to the labour force, while 250,000 reflected integration into the production process of people previously unemployed. It cannot however be regarded as certain that during the immediate future there will be an increase of anything like equal size. The stream of recruits to the labour force will be impaired in the coming period at least by the fact that even next year the number of young people leaving school and entering the labour market will be nearly 100,000 smaller than this year, quite apart from the possibility that the first people may then be called up for the German contingents of troops. What is more important however is that the reservoir of the unemployed has now been virtually drained out. In August, the last month for which figures were available at the time when this Report went to press, the number of registered unemployed declined by a further 55,000 to the level of 512,000. By the time when the winter season sets in there is every likelihood that the figure will have dropped to not more than 450,000, or something approaching half the total of \$20,000 at last year's low point according to the count for October. At that level the number would amount to only some 2.5 per cent of all employed wage and salary earners; that is to say, it would have reached a point which must in fact

Production, Turnover and Employment

.

For data for previous months and for explanatory remarks see the Tables under XIII (Production, Employment, Turnover and Prices) in the Statistical Section of this Report. -3 Position as at end of month or quarter. -3 Excluding all semi-finished goods, broad strip and steel tubes, including products for further processing; as from January 1953, including semi-finished goods for tube works. -3 Building industry proper, total. -4 Up to and including 1954: public buildings, buildings for industry, farm and other purposes. -6 Position at end of quarter. -9 Provisional figures. -5 Estimated. -9 Differences in the totals due to rounding off of figures.

,

be regarded as representing the persistent and irreducible minimum that is due in the main to the process of changing jobs. It might however be possible to find some compensation for the loss of this reserve and for the reduction in the number of young recruits to the labour force through the admission of foreign labour. In this age of "European integration" moreover such a method of relieving the pressure ought not to come to grief owing to any narrow-minded desire to protect the labour market. To be realistic however one can doubtless expect the bringing in of foreign labour to alleviate only part of the further tightening of the labour market which is in prospect; and, even if it proves possible steadily to raise the technical efficiency of labour, such tightness can hardly fail to affect the rate at which it will in future be possible to expand production.

The Coal Supply

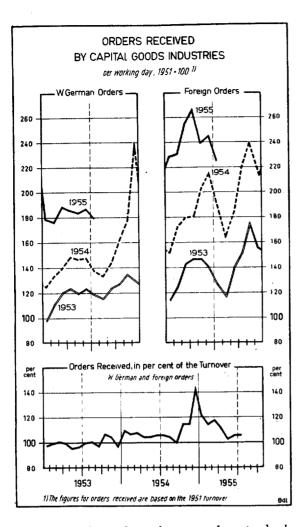

Apart from the wage demands, which in some cases have been much too large, and apart from the well-known bottlenecks in the building trade. there has recently been constantly growing evidence in the coal mines in particular of the serious effects produced by the increasing strains in the labour market. In August the output of pit coal as reckoned per working day again declined to more than the usual seasonal extent; in fact at the level of only 408,000 tons, as compared with an average of 437,000 tons for the first quarter of this year, it fell for the first time in years to below what it had been in the corresponding month a year earlier — in this case 410,000 tons. The reason lies entirely in the constant departure of miners going to other branches of activity some of which, owing to the general shortage of labour, are offering wages that seem to many miners more attractive than what is paid in the coal mines, especially on a comparison of the work demanded. The result was that during August the number of miners employed underground fell by a further 2,000 after having already dropped by about 7,000 between March and July. The effect was to bring the figure down by some 3,500 as compared with a year before. At the same time the number of shifts lost through holidays, illness and other causes rose from 20 per 100 men employed

underground in August 1954 to nearly 22 in August of this year. In these circumstances the fact that the output per man-shift was raised to 1,555 kg this August, chiefly as a result of improvements in technique and organisation, as against 1,509 kg in August last year was not enough to maintain the level of production the result being, as mentioned above, that the output of pit coal is now not merely no greater than a year ago but is actually smaller.

On the other hand however the consumption of coal is now some 12 to 15 per cent greater than in the corresponding period of 1954; and a further increase must be expected because growth continues in the production of industry, and especially in that of the ironworking industry which consumes a particularly large amount of coal. Industry will therefore have to resort on a steadily rising scale to the use of foreign coal, after the proportion of imported pit coal and coke to the total supplies in the West German market has already risen to 16 per cent in August. It is well known that this is not a problem of procurement, since coal is available on the world market in adequate quantity, while the United States in particular are capable of supplying it virtually without limit. But at least the coal obtained from the United States is considerably dearer. than West German coal, so that the rising imports entail a growing charge on industry - more especially because for reasons of price policy the non-industrial categories of consumers are fully supplied with coal from home sources, while the additional costs of importation therefore fall entirely on industrial consumers.

Demand

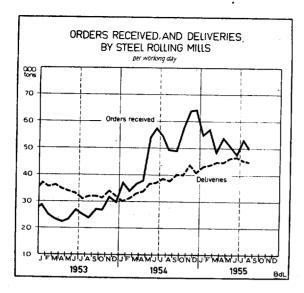

In general the flow of new orders remains very considerable, and continues in some critical branches of activity to exceed current production, although the position shows very great divergence as between different industries and in some of them certain signs of reduced tension are evident. Order backlogs continue in particular to characterise some of the basic material and capital goods industries. Taken as a whole, the amount of orders booked during July both in the basic material industries and in those producing capital goods declined; but the fall was smaller than is usual at the season and, what is more

important, the index of new orders in both groups remained about 6 to 7 per cent above the index for deliveries during the same period, whereas in May the excess of new orders over deliveries had already been reduced to between 3 and 4 per cent. Although these figures relate only to the gross inflow of new orders, while it is possible that a certain amount of earlier orders were at the same time cancelled, it would seem to follow that the backlogs of unfilled orders must have further increased. Especially from inside Western Germany the stream of fresh orders continues to flow very briskly, whereas during recent months the rate at which orders have been placed from abroad has become slower. For the time being therefore the domestic activity in capital investment is providing itself with constantly fresh support. A good deal of importance would incidentally seem in this connection to attach to the fact that the increase which was permitted during 1953 in taxation balance sheets in the rates allowed for the so-called degressive depreciation of certain items forming part of the fixed assets is leading enterprises immediately to plough back into their business a large part of their profits, which are at present very substantial. The current inflow of orders is on the other hand no longer affected by the much quoted Article 36 of the Investment Assistance Law, because that Article grants concessions in regard to depreciation only on items which were ordered not later than the end of 1954. It is however largely a consequence of that Article that the backlogs of orders in hand are so high at the present time in many capital goods industries. This is because, as was described in detail at the time, the tax privileges which that Article accorded led in the latter months of 1954 to a quite exceptional boom in the placing of new orders, and that boom is still substantially affecting the state of the market for capital goods.

To go into detail, it is especially in machine building and the electrical equipment industry that the backlogs of unfilled orders have recently been continuing to rise: that is to say, in industries which are as a rule especially affected by any general boom in investment. In both of these industries the amount of new orders placed in July was about 10 per cent greater than the turnover; and the trade fairs which have been held since then would seem, at least in the case of machine building, to have filled the order books still more. The result has been that the periods for delivery have once again become longer. In some other important industries, it is true, the state of the market is much less strained. In the case of vehicle building for example the current influx of orders during July was at a level 7 per cent below that of turnover, whereas in the corresponding month of the previous year it had been above the turnover by 4 per cent; and in waggon building and in the precision instruments and optical goods industry, to mention these only, unused capacities are still available in greater or lesser degree.

On the steel market too, where conditions until recently were especially typical of the strained state of the market for basic materials and capital goods, the position has of late not been growing any more strained but has if anything become a little easier. Thus, at least in

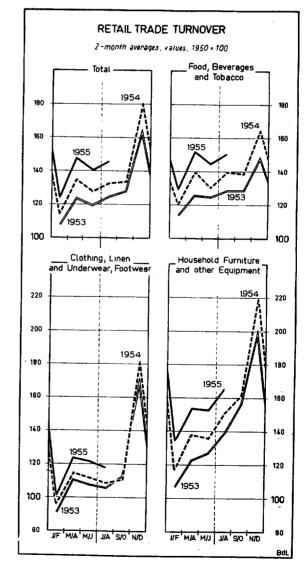

the case of the steel rolling mills, the amount of orders placed in August showed a slight decline after having risen appreciably in the previous month, mainly owing to the effect of some rather large orders placed by the Federal Railways. At the same time there has been further growth in deliveries as a result of the continuing increase in output, so that the gap between the amount of new orders and that of turnover has again become smaller. Since in addition it seems that some of the orders booked earlier have been cancelled, the result is that for practical purposes the backlogs of unfilled orders have shown little further growth. It is true that at the end of August, at more than 6.3 million tons, they still represented the production of about five months. The market thus continues to be a "seller's market". It therefore follows that it would be wrong to attach over-much importance to the fact that a further increase in production may be expected in the near future precisely in that industry, especially since it is quite possible that demand may grow once more if the propensity to invest remains as strong as hitherto. In general, by way of answering the people who forecast that the advance in production due to the great investment of capital will by itself restore a more normal state of the market, or even cause downward pressure on prices, it is necessary to emphasise that such forecasts are justified only if the course of demand does not stultify that calculation. To prevent that from happening however it was indispensable, as was explained in our last Monthly Report, to draw the reins

of monetary policy somewhat tighter. It must however be repeatedly emphasised that, with public or publicly encouraged capital expenditure at its present level, the steps taken will be able to produce quick results only if they are appropriately supported by the investment policy of the public authorities.

Greater Activity in Consumer Goods

The necessity of observing moderation in capital investment just now is moreover emphasised by the fact that the demand for consumer goods has recently again seemed to be growing more vigorously than it had up to about the spring of this year. Some time ago attention was already drawn in these Reports to the prospect of this change. It is due in the first place to the fact that, understandably enough, the great

increase in the income of the masses is by degrees producing greater effects on retail turnover as well as elsewhere. The change is however also being given a certain slant owing to the fact that the large stocks of goods which some of the consumer goods industries and also certain traders still seem to have had available at the beginning of this year have in the meantime been greatly reduced, so that the enlargement of demand now leads more promptly to a corresponding expansion of output. It is true that in August, the last month for which the index of production is available, the output of consumer goods increased to only about the usual seasonal extent; but in the subsequent period, to judge by the inflow of fresh orders, it seems likely that the rise will be if anything greater. Between May and July the amount of fresh orders was greater by about 17 per cent than in the corresponding period of last year, as against a ratio of increase of about 11 per cent in the case of production. It also appears that the amount of business done at the trade fairs for consumer goods held during the last few weeks was considerable. It therefore seems likely that the industries concerned will have entered the autumn and winter season with a comparatively large volume of orders in hand.

From the point of view of capacity most of the consumer goods industries will certainly be able to meet this increased demand without difficulty. Up till now the extent to which their capacity was engaged was in general much lower than in the capital goods industries; and in addition during the last two years many enterprises producing consumer goods, like those in other industries, have been making efforts to enlarge their capacity and above all to rationalise it. Apart from a few cases therefore there is little likelihood that bottlenecks may now occur among the consumer goods industries as well. From the point of view of the economy as a whole however the further enlargement of the demand for and output of consumer goods can nevertheless not fail to produce repercussions, because it of course entails an increase in the demands made on the potential supply of labour and basic materials in the economy. That aspect too should be kept in view when assessing the possibility of further expansion in capital investment.

Wages and Prices

As has already been indicated above, one of the most important causes of the tendency which has just been described for the activity in consumer goods to increase is that for some time past wages have been very strongly tending to rise. During the period under report also the movement in wages, which has been repeatedly mentioned in our recent Reports, continued with undiminished strength. In July this year the tariff agreements for about 1.4 million employed persons had already been terminated with the object of obtaining an increase in the rates of wages agreed therein; and during August and the first three weeks of September notices were given to terminate tariff agreements for approximately a further 2 million employed persons, including those in branches of activity as important as the metalworking industry in North Rhine-Westphalia and in Lower Saxony. Most of the notices in question were in point of fact timed to expire on the proper expiry date. Recently however there have also been a number of cases in which attempts have been made to enforce a revision of existing wage scales before the expiry of the agreed periods of notice. The demands for wage increases which were announced when notice was so given continue in most cases to be very far-reaching. In the case of the metalworkers in North Rhine-Westphalia and in Lower Saxony for example there was a demand that the tariff rates which had come into force on 1 September and 1 October of last year respectively should be raised by an average of 12 per cent. The increase demanded is more than double the above-mentioned rise in the productivity of the country's economy between the first half of 1954 and the first half of 1955. Besides this the realisation of this claim would once again cause a large gap to appear between the highest wages of metalworkers and the wages of miners, which were raised only this spring; and in consequence, no doubt, it would further increase the movement of workers away from the mines, besides possibly exerting a strong upward spiral effect on the wages of miners.

It is not precisely known to what extent tariff wage rates have so far in fact been raised. As a rule mention is made of rises of 6 to 8 per cent, in which connection it is assumed that the starting point is the basic wage rates in the existing tariff agreements, which mostly came into force about a year ago. Up to a certain point this process may of course represent merely an adjustment of the tariff rates of wages to the amounts which have hitherto been in fact earned; but of course that also increases the pressure for a corresponding rise in the actual earnings. It is common knowledge that at least up till now the state of affairs at present prevailing in the labour market has been greatly favouring efforts tending in this direction, the reason being that many employers with the object of obtaining any labour at all have been inclined to offer wages

higher than the tariff rates, and in this way to entice labour away from each other. It remains to be seen whether the steps that have been taken to make the procurement of working resources more difficult, and the other efforts to keep prices stable, have caused any change in this respect or may yet do so. In this connection too the permitting of migration of labour within Europe might bear much fruit.

During the period under report, as already mentioned, the level of prices did not rise further as measured by the main representative price indices after the slight rise during the two or three preceding months. During August indeed, and also so far as can be seen during the first half of September, certain indices have actually fallen to some extent. This applies in particular to the cost of living index, to the overall index of retail prices and to the index for basic foodstuffs, all of which, mainly as a result of seasonal tendencies, are back again at a level slightly below that of July. The remaining price indices have in general remained stable during the last few weeks. Price rises worthy of notice occurred only in the case of certain basic materials produced by industry, especially in that of non-ferrous metals, raw rubber and steel scrap. For the most part these rises were due to causes connected with world markets, since on many of these a certain upward movement had started again during the last few weeks. Recently however, especially so far as basic foodstuffs are concerned, the main body of the world markets have again been if anything subject to downward pressure owing to the fact that exceptionally good crops have reached maturity this year almost everywhere in the Northern hemisphere.

A fact which above all deserves attention is that the producers' prices of industrial products have continued to show stability, not only as a whole but also in almost all sub-groups. Accordingly the actual price situation remains much more stable than might be supposed in the light of the lively discussions about prices. For the time being, it is true, tendencies for prices to decline are hardly apparent any longer; but it should be remembered that such declines are in the long run indispensable in the interest of keeping the overall price level stable because, in view of the divergent movement in productivity while

wages are rising, it will always be impossible to prevent prices in certain categories from moving upwards. The increasing rarity of downward price movements is therefore a legitimate cause of misgiving, and is quite rightly at the present time presenting one of the problems of policy which are regarded with the greatest urgency by the Federal Government. This latter is certainly not, as some people mistakenly suppose, pursuing the utopian objective of seeking to lower the overall price level in a situation such as that now prevailing. What the Government is trying to do is to prevent a general rise in prices by ensuring, amongst other things, that advances in productivity shall be reflected at least partly in price reductions. The specific means which the Government is applying to that purpose certainly represent an important supplement to the measures

of credit policy directed to the checking of monetary expansion, more especially since the measures adopted by the Government are also to include appropriate regulation of the amount of public capital expenditure and its spacing out in point of time.

Foreign Trade and the Balance of Payments

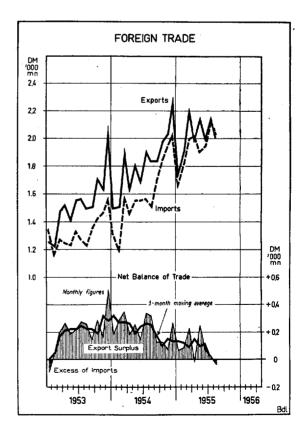

Foreign Trade

The latest foreign trade figures provide further confirmation that the position of the German Federal Republic in regard to foreign trade and payments is rapidly changing, inasmuch as the large rise in imports has produced steadily greater contraction in the export surpluses which had formed the basis of Western Germany's position up till now as a surplus country. In August this year, the last month for which data are available, the balance of trade was actually adverse to the extent of DM 31 million with imports at DM 2,033 million and exports at DM 2,002 million. after there had already been a deficit of not quite DM 7 million in April this year, this being the first deficit since January 1953. Since in July an export surplus of only about DM 33 million was achieved, there has thus been practically no surplus for the past two months taken together. while even in June exports had exceeded imports by only DM 66 million. When one realises that as against this the period from June to August 1954 showed a total favourable balance of DM 808 million, it becomes clear how radically Germany's position in respect of foreign trade has altered in the course of the past year.

As was mentioned above, the chief cause of this alteration lies in the considerable growth of *imports*. It is true that the imports in August conformed to the usual seasonal movement by being somewhat smaller than in July; but, just as in that month, the August imports were above their level in the corresponding month of last year by about 34 per cent, as against 31 per cent in the first half of 1955. In view of the fact that the bulk of the imports in any year usually fall in its second half, and that the trend in wide areas of activity is tending more and more to expand imports, it must be expected that during the next few months these latter will rise further.

On the other hand it can be seen with increasing clearness that the growth of exports is not only lagging appreciably behind that in

imports, but also that for some time past it has no longer been able to keep up the pace previously set. In fact the decrease of some 7 per cent in exports in August by comparison with the previous month was substantially greater than in the preceding two years. But even if one takes a longer period, so as to avoid being misled by fortuitous month-to-month variations, one finds that the trend presents a picture which is no longer anything like so favourable as it was even in the early months of this year. In the first two quarters of this year for example the figures for exports exceeded those for the corresponding period a year earlier by 19 per cent; but in July and August the corresponding ratio of growth fell to 11 per cent, while in August alone it was down to 9 per cent. And if the exports in August are expressed in terms of the average per working day at DM 74.4 million, they fell short of the

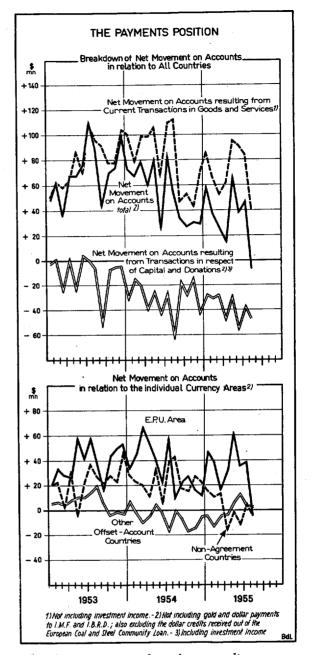

corresponding average for the months in the first quarter by more than DM 3 million, whereas the similar average of DM 70.6 million for August 1954 had exceeded that for the first quarter of that year by nearly DM 6 million. To all appearance therefore we have confirmation, at least for the past months, of the long-standing experience according to which an increase in domestic demand as great as that which has been apparent for more than a year now will not as a rule leave the course of exports unaffected, especially when there are areas of decisive importance in which the expanding demand is no longer meeting corresponding elasticity in supply.

Payment Transactions with Foreign Countries

Overall Position

The recent course of payment transactions with foreign countries also indicates that the time when the German Federal Republic could be regarded as an extreme surplus country is for the present ended. In fact in August, the last month for which comprehensive data regarding inward and outward payments on the accounts serving for transactions with foreign countries are available, there was actually an adverse balance for the first time in more than three years, amounting in point of fact to \$ 7 million; and, even if as against this there should again be a surplus in September, it seems likely that it will be smaller than the average for the first seven months of this year.

As to the factors which account for these changes the graph gives further information. It shows that of late it has been above all the surplus in respect of goods and services that has appreciably declined. In August the net receipts of foreign exchange in respect of goods and services were only \$ 41 million, as compared with \$ 84 million in July and a monthly average of \$ 76 million for the first half of the year. It seems moreover hardly possible that the most recent deterioration in the balance of trade can yet have been reflected in the payments position because, if it had been. the surplus on payment transactions would no doubt have been smaller still. It would therefore appear that the discrepancy in point of time between the net balance of actual exchanges of goods and services on the one hand, and the

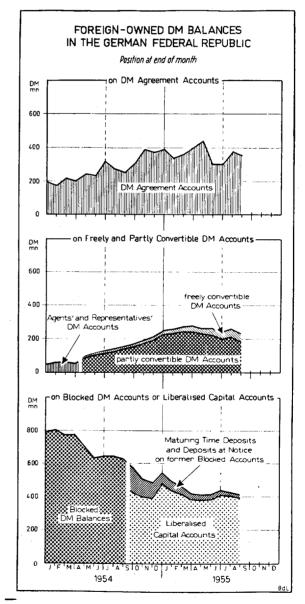

related payments on the other — a discrepancy which was mentioned in the last Monthly Report — has so far still been operating to benefit the German Federal Republic. This of course incidentally entails, as it were, a mortgage on future payments; and therefore it would not be surprising if the payments surplus in respect of goods and services were to decrease still further in the near future, even if the balance of trade should no longer deteriorate. There is the further fact that of late hardly any fresh documentary credits have been taken on the German part, while indeed there is evidently some tendency to repay those previously taken because the level of interest rates in some foreign countries has risen. Certainly between the end of April and the end of August the total amount taken and outstanding on documentary credits fell from DM 324 million to DM 270 million; and it does not look as though this movement had yet reached its end. To the extent to which the amount of outstanding documentary credits falls, however, it will be necessary to pay for imports out of the other foreign exchange available.

The deficit on capital transactions, including transfer of the service, has not shown any further appreciable growth of late, because since the end of the past year in particular the payments due in respect of the German indebtedness regulated under the London Debt Agreements only require almost invariable amounts. Still, there are often quite considerable variations between one month and another according to the dates when payments fall due. In August for instance, mainly as a result of the redemption instalment in respect of British post-war economic aid that was mentioned in our last Monthly Report, the deficit of \$ 29 million was greater than the average for the preceding months. The effect is that if the adverse balance on transactions in connection with capital is taken together with donations to foreign countries, which were also relatively large in August at a total of 19 million, with the chief item representing payment for deliveries of oil to Israel, then the resulting total was for the first time greater than the surplus which can still be recorded on the balance of payments in respect of goods and services. That in fact is how the adverse balance of \$ 7 million, which has already been mentioned, arose on the total payment transactions with foreign countries.

On looking at the net balance of payments in respect of capital movements and the service of capital, it is true, one must bear in mind that it is determined not only by the net amount of payments that are transferred to foreign countries, but also by the many changes which take place on the DM accounts of foreigners especially on Liberalised Capital Accounts without there being any related transfer of funds to a foreign country. Thus every in-payment of DM into these accounts in favour of foreign creditors adversely affects the net movement on the foreign accounts even if the amount in question is not transferred abroad; and in the same way the net movement on foreign accounts tends to become more favourable when the total holding of Liberalised Capital Marks is reduced simply by payments to West German recipients, as happens for example when German securities are acquired. A point of decisive importance in this connection is that, according to the usual international definition, only the sight bank balances of foreigners and not the funds which they hold employed at longer term are regarded as a foreign exchange liability.

The following graph shows the movement during the last few months in the balances held

by foreigners on Liberalised Capital Accounts. It will be seen that since the spring there has been only slight change in the total amount of such balances, whereas during the first few months after Liberalised Capital Marks were created in September 1954 there was a substantial decrease. At the same time however there have been large transactions on these accounts. Details regarding these are given in the table which follows.

As will be observed, much the largest movements regularly resulted from purchases and sales of securities. In this connection it is worth remarking that, despite considerable variation in individual months, there was on the whole a large measure of balance as between the DM 813 million of securities which foreigners have bought by the debit of Liberalised Capital Accounts since October of last year on the one hand, and the DM 776 million of securities which were sold against Liberalised Capital Marks. If one compares however the total amount of liquidations of investments, which comprise apart from security sales also loan repayments. sales of real estate, etc., with the total amount of new investments of Liberalised Capital Marks, the new investments show a predominance of DM 131 million, which corresponds to the amount by which the balances on Liberalised Capital Accounts decreased between' the end of September 1954 and the end of August 1955. This difference between liquidations and new investments is substantially due to the fact that the figures for new investments also cover a large proportion of re-investments of such amounts as have been paid as dividends to foreign creditors into Liberalised Capital Accounts and are consequently shown among the Incoming Items of the accompanying table under Investment Income rather than under Liquidations. If this re-invested investment income is left out of account, it appears that the German in-payments for reparations and the settlement of liabilities arising from services and capital movements compare with an approximately equal amount of transfers from Liberalised Capital Accounts to foreign countries and to DM Accounts of Limited Convertibility.

In August, in spite of the deficit on payment transactions with foreign countries as a whole, the gold and foreign exchange holdings of the Bank deutscher Länder increased by \$ 4 million. The difference is due to the fact that the net movement on foreign accounts, which reflects the changes on all credit balances and liabilities in relation to foreign countries on current bank accounts, not only covers movements on accounts at the Bank deutscher Länder but also includes changes on the accounts kept at the Foreign Trade Banks (including the various DM accounts - see the graph); and the movement at the Foreign Trade Banks is quite often contrary to that on accounts at the Bank deutscher Länder. In August in fact, as against a net accrual of gold and foreign exchange to the extent of \$ 4 million at the Bank deutscher Länder, there was a net loss of foreign exchange at the Foreign Trade Banks amounting to \$ 11 million. This loss was due to the fact that the credit balances kept abroad by the Foreign Trade Banks dropped to a larger extent than their liabilities to foreign countries on the DM accounts of foreigners kept with them. With the

August addition the gold and foreign exchange held by the Bank deutscher Länder rose to DM 12,100 million, and with the further additions during the first three weeks of September it went up to DM 12,200 million. Of this total DM 3,500 million was gold, DM 5,700 million freely available currencies and DM 3,000 million clearing currencies, among which latter the credit balance of DM 2.300 million with E.P.U. was much the largest item. The exchange position of the Foreign Trade Banks on the other hand shows a net deficit. This is because these banks can at any time obtain on the market the foreign exchange which they need, or in the case of some currencies can draw on the Bank deutscher Länder's holdings; and this fact, coupled with considerations of the interest obtainable, causes them to keep only small balances of foreign currency, so that these are exceeded by the DM balances which foreigners keep on their accounts with them. The net deficit is however of insignificant size by comparison with the Bank deutscher Länder's stock of gold and foreign exchange.

Payment Transactions classified by Currency Areas

The classification of payment transactions by currency areas shows that in August there was a small favourable balance only in relation to the group of Other Offset Account Countries, whereas the payment transactions with the two most important currency areas comprising the E.P.U. countries and the non-agreement countries resulted in each case in a deficit of \$ 5 million.

What was particularly remarkable was the deterioration in the balance of payments in relation to the *E.P.U. Area*, since the deficit in respect of this — and it was the first such deficit since the fourth quarter of 1952, when there were large purchases of dollar goods through non-dollar countries — had been preceded in the months from May to July by fairly large surpluses amounting to \$74 million, \$39 million and \$39 million respectively. In part this marked worsening in the position was due to the redemption payment to Great Britain which has already been mentioned. A still more important factor however was the decline in the payment surpluses resulting from goods and services. The fall in the

amount of these surpluses which has been proceeding since June, amounting to about \$ 10 million between May and June and to some \$ 20 million between June and July, became still more rapid when it reached nearly \$ 30 million between July and August. The result was that the surplus on net payments arising from goods and services contracted to about \$ 20 million.

In spite of the deficit on overall payment transactions with the E.P.U. Area the August E.P.U. settlement nevertheless gave the German Federal Republic an accounting surplus of 15 million units of account, although this, it is true, compared with 52 million units of account in the previous month. The difference between this accounting surplus and the above-mentioned adverse balance on payment transactions with the E.P.U. Area in the amount of \$ 5 million was mainly due to the fact that the repayment of debts to Great Britain in the amount of \$ 21 million, which is not included in the E.P.U. settlement, has been taken into account in the net movement on the foreign accounts. In accordance with the new conditions of settlement, which have been in force as from August, the accounting surplus was settled to the extent of three-quarters through payment of gold or dollars by E.P.U. As a result the residue remaining as the "credit portion" was less than 4 million units of account, this being smaller than the bilateral instalment payments of France and Denmark, which together reached \$ 4.4 million and had to be taken into account in the August settlement. Consequently the German Federal Republic's credit balance in E.P.U. declined as at the end of August by not quite 1 million units of account to a total of 537 million units of account - whereas, if the old settlement formula of 50 per cent credit and 50 per cent gold or dollar payment had been applied, the balance in question would have risen by more than 3 million units of account in spite of the abovementioned bilateral consolidation payments. As against this it must be expected that for September there will be a rise in Germany's credit balance with E.P.U. because in the course of that month to date the German Federal Republic's current surpluses have been greater than in August, while moreover the redemption payments falling due are smaller.

For data for previous months and for explanatory remarks see Tables under XII (Foreign Trade and Payments) in the Statistical Section of this Report. ¹⁾ Imports from selling countries; exports to buying countries. — ³) Excluding countries not ascertained. — ³) Net balances of all payments in respect of goods, services, capital movements, investment income and donations. — ³) Equivalent, for the period from 1 July 1954 to 31 July 1955, to twice the amount, as from 1 August 1955 to the quadruple amount of the cumulative position in respect of credit granted. — ⁴) Calculated from the cumulative position in respect of credit granted or obtained in the monthly E. P. U. settlements, the redemption of credit under the agreements concluded in connection with the E. P. U. rearrangement in mid-1954, and a special repayment effected by France early in 1955. — ⁷) Including balances in Canadian \$. — ^{*}) Partly provisional figures.

On payment transactions with the non-agreement countries it was not surprising that Western Germany in August again moved away from its surplus position after the \$ 6 million surplus which had been partly the result of special factors in July, because even in the second quarter of this year the surpluses in respect of goods and services, including the dollars received as the result of their being exchanged into DM by American agencies in Germany, were already too small to counterbalance the charges arising from debt service and reparation deliveries; and since then imports from the Dollar Area have risen by much more than exports to the countries in that area. In September also, to judge by the movement to date, payment transactions with the Dollar Area are likely to remain in deficit. Incidentally the position here seems to be in some degree affected by the fact that the tendency for the amount of documentary credits to fall owing to the influence of rising interest rates in the United States has recently spread to documentary credits taken in the Dollar Area. At all events during August the credits originating from that area decreased in amount by \$ 7 million, whereas in the previous month they had still shown an increase of \$ 5 million.

The payments surplus in relation to the Other Offset Account Countries remained virtually unaltered in August at \$ 3 million as against the previous month; and the surplus for September may be expected to be somewhat larger still. In this connection it must of course be borne in mind that in that currency area the net movement on foreign accounts is not identical with the change in credit balances on the Bank deutscher Länder's current offset accounts (which are published each month by the Bank deutscher Länder in a special press announcement). This is because the net movement on foreign accounts includes not only the changes on these "U.S. dollar agreement accounts", but also those on a number of other accounts as well. In August the difference between the overall net movement on foreign accounts and the changes in the current offset accounts was in fact quite large, because a drop of \$ 5 million in the credit balances on these accounts was outweighed, in its effect on the net movement on foreign accounts, by surpluses on

the other accounts concerned. These surpluses were partly due to the fact that certain countries drew on the transitional credits which the Bank deutscher Länder had granted to them for the purpose of easing the change-over to a system of payments in terms of DM of Limited Convertibility. In addition one country made a sterling payment equivalent to 3 million in order to avoid exceeding a "swing".

The decrease in the Bank deutscher Länder's total credit balance on current offset accounts was almost entirely due to the fact that the total German credit balance on offset account with Brazil, as mentioned in the last Monthly Report, has started to decline at a brisk rate after the new arrangement for payment transactions with Brazil which came into force at the beginning of August. Between the end of July and the end of August the credit balance remaining on the account fell by \$ 13 million to about \$ 12 million. It is true that in the course of September to date the rate of fall in the balance on this account has become somewhat slower, the total outstanding on 28 September 1955 having been \$ 6.8 million; but this reflects only imperfectly the real course of payments, inasmuch as during the same period credits were opened to a substantial extent; and use of these credits, which depends in practice on how far it will be possible to ship the goods ordered, would result in wiping off the whole of the remaining German credit balance at the Bank of Brazil. Since the rearrangement of payment transactions with Brazil there has been an extremely keen demand for that currency. This moreover has come not only from German importers but also from people in the Netherlands and Great Britain, who under the new arrangement for payments can acquire German "Brazil dollars" for the purpose of using them to cover their own payment liabilities towards Brazil. Owing to the speedy reduction of the Brazil Account the transitional arrangements in force since 1 August this year, under which German payments to Brazil have to be effected through the U.S. \$ agreement account whereas on the Brazilian side payments are made already in DM of limited convertibility, comes to a close on 1 October, indeed at an earlier date than had been expected. Thus, as from that date

the payments of German importers to Brazil will also be effected through DM Accounts of Limited Convertibility.

By way of contrast to the movement on the Brazilian account there were in most cases additions, both in August and in September up till now, to the balances on accounts of those countries, payments with which will continue to be settled on a bilateral basis (through U.S. agreement accounts). This applies in particular to the Argentine account, on which the result of transactions up to 28 September this year was again to give the German Federal Republic a credit balance of agreement for a bilateral basis (the balance of ggreement account, whereas as late as the end of July it still had a debit balance of ggreement account is largely due to the fact that recently the Argentine authorities, who during the past agreement-year showed great caution in issuing licences for current trade in goods, have been licensing imports from the German Federal Republic on a somewhat larger scale. As the swing for German-Argentine payment transactions in accordance with the German-Argentine Trade Agreement of 2 November 1954 has been reduced from \$ 35 million to \$ 12 million as from the beginning of the second year of the Agreement (15 August 1955), Argentina's available margin of credit still amounted to \$ 8 million on 28 September. Germany's offset account balance in relation to Egypt has also risen again, i. e., from \$ 16.7 million on 31 July this year to \$ 20.9 million on 28 September. Up till now however the "swing" of \$ 15 million has not been exceeded if one deducts from the German credit balance the amount of the export credits which are contained therein, but which so far have not been used.

The Formation of Wealth and its Financing in the Year 1954

In the following pages there is presented a study by members of the Economic and Statistical Department of the Bank deutscher Länder in which, partly with the help of estimates, an attempt is made to give a statement in terms of figures describing the formation of wealth within the country's economy and its financing during the year 1954, while drawing comparisons so far as possible with the years from 1950 to 1953. The purpose of this study is to carry further, and to place on a broader and consequently more reliable basis, the Bank's earlier researches into the financing of capital investment in fixed assets and into the provision of medium and long-term funds for financing purposes.

As every expert will be aware, the statistical difficulties and the difficulties of method which have to be overcome in the attempt that is thus made are considerable. The Bank would therefore like to have the present study regarded as merely an initial statement which may possibly need to be subsequently revised in one particular or another. Even so, the figures may already afford an interesting insight into the formation of wealth within the country's economy and into the related financing processes. The Bank hopes that at the same time it may by this contribution be promoting similar studies by others.

Preliminary Observation as to Method

The studies hitherto published by the Bank deutscher Länder of the financing of capital investments have been largely confined to describing the "provision of medium and long-term funds for financing purposes". In this connection the lack of supporting statistics made it necessary to confine the studies to the funds provided through institutional investors, public budgets and purchases of securities. There were on the other hand no data as to the self-financing of enterprises or as to the credits directly granted to these by parties other than banks. The method which was tried for a time of estimating the amount of self-financing (including the taking of short-term bank credits and direct credits) as the difference between the statistically ascertained funds for financing purposes at medium and long term and the total amount of investment in fixed assets has no longer been practicable in recent years¹). It has in fact become apparent that the provision of funds at medium and long term for financing purposes to the parties engaging in capital investment, and the use of those funds for the investment projects, have in point of time been falling less and less within the same period. Transactions by which capital is raised in advance, and the use of long-term loans as well as of proceeds of the placing of securities for the purpose of consolidating short-term credits, have been important factors in this con-

nection. There is the further point that this way of regarding the matter was based on the assumption that the medium and long-term funds for financing purposes would be used only for capital investments in fixed assets, whereas it has become increasingly probable that through them a part of the steadily growing stocks of goods is also financed. Account had also to be taken of the possibility that funds at medium and long term taken for financing purposes may be used for building up financial reserves or for acquiring securities and participations. For the purposes of describing the financing processes it was necessary to draw from these observed facts and considerations the conclusion that the taking of funds for financing purposes can be brought into relation only with the overall amount of wealth formation, namely with the investments in fixed assets and stocks of goods as well as with the formation of monetary wealth as a whole. On the other hand however so comprehensive a statement of the matter entails the need to include, in addition to the financing through credits at medium and long term, also the undistributed profits, the short-term credits and all the other relevant processes giving rise to indebtedness.

For the presentation of such an overall view of the formation of wealth, and of its financing, the lay-out hitherto used for describing the provision of funds at medium and long term for financing purposes was not suitable. The new scheme of presentation which is the basis of the present study has been worked out on the analogy

¹⁾ See the Monthly Reports of the Bank deutscher Länder for October 1953, pages 24 ff., and March 1954, pages 27 ff.

of the method used for the National Accounts. while some of the figures ascertained in that connection have been utilised. In particular the data relating to investments in fixed assets and in stocks of goods have been taken from the Federal Statistical Office's calculations for the National Accounts, while those relating to savings in the individual "sectors" are based on the Bank deutscher Länder's own estimates, in which latter, however, use has been made of official calculations so far as these were available. As regards the "sectors" into which the country's entire economy is sub-divided in the National Accounts a distinction is made in the present study between "private households", "enterprises", "the Government", "foreign countries" and "West Berlin including the Sovietoccupied part of Germany".

The "private households" comprise all households of private persons including those of people who are self-employed, such as farmers, houseowners, individual traders and the like, as well as non-profit organisations. The "enterprises" are reckoned as including all private and governmental entities based on profit and loss principles, without regard to their legal form. The economic activities of the selfemployed are allocated according to their significance either to the enterprises (where it is a matter say of capital expenditure or undistributed profit) or to the private households (in the case of for instance private consumption and the formation of savings outside the sphere of business); and in this connection it should be stated at the outset that the separation on these lines can be effected only if one is prepared to accept possibly considerable statistical errors. The "Government" sector includes all public authorities, namely the territorial authorities together with the Equalisation of Burdens Fund, the E.R.P. Special Fund and the Social Insurance Institutions. In the sector for "foreign countries" a picture is presented, by analogy with what is done in the balance of payments, of the relations with countries using foreign currencies; this sector does not include the commercial and credit relationships between the area of the German Federal Republic on the one hand and West Berlin and the Soviet-occupied part of Germany on the other, these being shown separately.

For each individual sector the total formation of wealth and its financing are described. The taking of credit and the formation of monetary wealth are however regarded as comprising only the accrual of liabilities and claims relating to other sectors or to financial institutions, while claims on any economic entity in the same sector (for instance claims of enterprises on enterprises, or claims of Social Insurance Institutions on the Federal Government) have been offset against the corresponding liabilities. A similar consolidation has also been carried out as between the financial institutions. which are reckoned as comprising credit institutions, building and loan associations, insurance companies and the securities market. For this purpose the financial relationships between the individual groups of financial institutions, for example between banks and insurance companies, have been eliminated statistically, and what is shown accordingly is simply the claims and liabilities in relation to the enterprises and other sectors. It should be specially mentioned that in this connection the securities market, through which the debtorcreditor relationships between the issuers and purchasers of securities are established, is also treated as a financial institution.

I. Wealth Formation and Savings

The formation of wealth within the country's economy comprises the total addition to the national wealth which accrues within a given period and which corresponds to that part of the national product that is neither consumed nor used for replacement investments. As against this addition there stands on the side of income the "saving", a term deemed to include the whole of the income which is not used for purposes of consumption and which, by definition, is equal to the formation of wealth in terms of goods. The size of this saving indicates to what extent the individual sectors of the country's economy have acquired claims to the accruing increment to the national wealth. As a general rule any substantial changes in the distribution of the total saving as between the various sectors, and in particular any shifts as between the shares going to enterprises and to the remaining sectors, have the closest of connections with changes in the financial situation, and in particular with the level of prices and the course of foreign trade. The extent and the determining causes of such changes are analysed in this first section. That analysis however does not yet answer the question of how the formation of wealth in the individual sectors was financed through the intermediary of the credit system. It is not until the second section that this problem is dealt with.

1) The Formation of Wealth

The formation of wealth in the economy as a whole takes place through investments in fixed assets and stocks of goods within the country, as well as through the net accrual of claims on foreign countries, on West Berlin and on the Soviet-occupied part of Germany. In the course of 1954 this total formation of wealth, reckoned without replacement investments, again showed vigorous growth, rising to DM 27,500 million from the previous year's total of DM 25,200 million. In percentage terms however this increase, at 9 per cent, was only slightly greater than that in the net domestic product; and consequently the ratio of wealth formation to the net domestic product at market prices, namely 20 per cent in 1954, remained practically unchanged by comparison with the previous year.

In 1954 the formation of wealth within Western Germany showed especially vigorous growth. This applies in particular to the net capital investments in fixed assets, which increased during that year by 11 per cent. It would also seem that investments in stocks of goods rose more than proportionately in 1954, although the figures which have been obtained on this subject are relatively uncertain, and no far-reaching conclusions can be drawn from them¹).

Unlike the wealth formation within the country the accrual of claims on foreign countries, which consists mainly of the acquisition of gold and foreign exchange, showed a decrease in 1954, declining to DM 3,100 million after having been DM 3,600 million in 1953. The chief factor in causing this movement was the large rise in imports, which must be attributed to the vigorous expansion of total domestic demand. Besides this the net balance of transactions was also much affected by the resumption of the service of capital.

In 1954, as had already been the case in the previous year, the net effect of credit relation-

¹) The figures relating to the changes in stocks of goods differ slightly from those of the Federal Statistical Office because in the item in question, which was obtained as a residue, it was necessary to take into account discrepancies that arose from differences of delimitation in the foreign account and in private consumption.

ships between the area of the German Federal Republic on the one hand and West Berlin and the Soviet-occupied part of Germany on the other was to produce a deficit for the former. In the course of this movement the credit taken by the area of the German Federal Republic was confined almost entirely to West Berlin: in relation to the Soviet-occupied zone of Germany the claims of that area showed only a slight net decrease.

In 1954 the net amount of credit granted by West Berlin to the area of the German Federal Republic was about DM 300 million. It arose from the fact that during recent years the financial aid which West Berlin has been obtaining through its inclusion in the financial system of Western Germany, as well as through direct allocations of funds to the Berlin city budget and through grants out of Counterpart Funds. has amounted to more than West Berlin's deficit in respect of goods and services. From this however it is not possible to draw the conclusion that the help given to West Berlin in these forms was too great, since the help was not given in order to produce equilibrium in the "balance of payments" - which represents merely a statement that has to be constructed for purposes of calculation - but was given for special reasons of financial, economic and social policy. To a certain extent indeed, for example within the limits of the order-financing programme, funds were actually channelled into Berlin from the outset with the object of thereby enabling suppliers in that city to allow longer payment terms to their customers in the area of the German Federal Republic. (Further details are given on page 50 as to the other ways in which credit was granted.)

It was due to the reduction in the net amount of credit granted to foreign countries that, in spite of the growth in capital investments at home, the ratio of wealth formation during 1954 to the net domestic product at market prices was at 20.4 per cent practically no higher than in the previous year. In its effect on financial stability this shift as between growing capital investments within the country and the reduced grant of credit to foreigners was of considerable importance because it contributed towards preventing domestic prices from rising. The data so far available for the current year confirm that this offsetting tendency as between growing investment at home and decreasing wealth formation abroad has continued.

2) Saving

It is true that from the point of view of price stability it is not so much the absolute amount of wealth formed as the relation between that amount and the saving in the various sectors that is important. Recent years offer some very clear examples of this. In 1951 for instance the formation of wealth increased very greatly indeed, while the saving of private households increased practically not at all and that of the Government not very much; in that year prices and the profits of enterprises accordingly showed an extremely large rise. The position was the opposite in 1953, when the saving by private households and public authorities increased relatively more than the formation of wealth, while there was a parallel process in the shape of appreciable downward pressure on prices and a decline in profits. In 1954 there were no such extreme movements. While total wealth formation and saving in 1954 were up by nearly 9 per cent as against the previous year, saving by private households was up by not quite 19 per cent and that of public authorities by 13 per cent. It was only the undistributed profits of enterprises which probably showed no substantial change in 1954 if regarded as a whole. In accordance with these fairly uniform movements the overall price level, regarded in terms of its yearly average, also remained constant in 1954.

The private households saved more than DM 7,000 million in 1954 as against DM 6,000 million in 1953. This increase of nearly 19 per cent was a good deal greater than that in the disposable income of private households¹), which rose during the same period by only about 9 per cent. There was thus a further rise in the proportion of disposable income saved, namely from 7.3 per cent in 1953 to 8 per cent in 1954. This further increase in private saving reflects on the one hand the confidence of consumers in the stability of prices; but from another angle it also reflects the need to overtake arrears in the accumulation

¹) This is deemed in the present calculation to include the disposable incomes arising from wages and salary, public assistance pensions and benefit payments, as well as from drawings of self-employed persons from their businesses for housekeeping purposes — these last being found as a residue.

of financial reserves, for which purpose it was still possible last year to take advantage of substantial tax concessions. In spite of the fact that during the last few years the saving of private households has so greatly increased, it must be said that the ratio of that saving to total saving, and therefore also to the total formation of wealth. still remains comparatively low at 26.0 per cent.

A strong effect on financial stability was produced in 1954 by the saving of the Government, which term is taken in the National Accounts to mean the total surplus of current receipts of the territorial authorities, the Equalisation of Burdens Fund and the Social Insurance Institutions over their current expenditure, other than capital expenditure, this latter being also reckoned as part of the "saving". The Government saving rose from DM 10,100 million in 1953 to upwards of DM 11,400 million in 1954. The increase of DM 1,300 million in 1954 was however appreciably smaller than in 1953, when saving by the Government had risen by DM 2,700 million. This was due in the first place to the movement in Government receipts, which as a result of the preceding tax reductions did not rise by nearly so much as in 1952 or 1953. There was however a further rise to 41 per cent during 1954 in the Government's share of total saving within the country's economy, at which level the said share exceeded that of the private households and also that of enterprises. As is shown in more detail on page 47, much the largest part of this Government saving served to finance the Government's own capital expenditure as well as the granting of

loans, especially loans for housing and loans to expelled persons for the purpose of establishing their means of livelihood. Capital formation by the Social Insurance Institutions also accounts for a large part of the Government saving. On the other hand the net cash surpluses were of only subordinate importance as a factor in 1954.

In 1954 for the first time since 1952 there was no further decline in the saving of enterprises, in the sense of the total amount of the undistributed profits of corporations and self-employed persons. Since there was a rise from DM 37,000 million for 1953 to DM 40,000 million for 1954 in "original" profits, that is to say in profits before deduction of taxes and of owners' withdrawals of funds for private purposes, it is actually surprising in view of this appreciable improvement in the profit situation that the undistributed profits did not also rise by any notable amount in 1954, but instead were estimated to have remained at about the 1953 level of DM 9,000 million. It is however possible to state a number of reasons which may explain this failure of undistributed profits to rise. In 1954 the tax payments of enterprises further increased, although by nothing like so large a margin as in the preceding year. At the same time corporations paid much greater dividends than in earlier years. In addition the freeing of transfer for earnings on foreign participations in West German enterprises made it possible for the first time to effect substantial transfers of distributed profits to foreign countries. Besides this there was also some growth in the amounts taken by selfemployed persons out of their businesses for private purposes. One effect of this was to increase the private consumption of self-employed persons. Apart from that however there was also a rise in the private formation of savings by the selfemployed, a clear indication of which can be seen in the exceptionally large growth that took place during 1954 in the amount of saving in forms carrying tax concessions¹).

The undistributed profits of enterprises in 1954 were still far below the record level of 1951, although that level had been reached only at the cost of a marked increase in prices; and moreover it covered a certain proportion of fictitious or apparent profits which arise in such circumstances on the valuation of stocks of goods. The tendency which was afterwards evident for the ratio of undistributed profits of enterprises to total saving within the nation's economy to decline continued during 1954 if that year is regarded as a whole. It is however true that the fall in the said ratio from 36 per cent in 1953 to 32 per cent in 1954 was no longer large, while the figures for the whole of the latter year veil the increasing importance which undistributed profits were attaining towards its close.

In 1954 no great importance attached any longer to the contributions which foreign countries made to the total formation of savings in the form of transfers of wealth — mainly through the donation of imports as foreign aid. At all events during 1954, just as in the preceding year, such foreign contributions were actually smaller than Western Germany's own transfers of wealth to foreign countries, especially Israel, and to West Berlin.

II. The Financing of Wealth Formation

The financing of capital investments and of wealth formation in other forms can be effected only in part out of the saving of the actual parties engaging in the investment. This is because a large part, and during recent years a steadily growing part, of the saving arises in the budgets of private households and public authorities which do not themselves invest their saving or invest only a certain proportion of it. Accordingly the parties engaging in capital expenditure, which means primarily enterprises, have been obliged during recent years and especially in 1954 to borrow on a constantly growing scale.

However, the question of the extent to which the parties' own resources or those of other parties were used for the purpose of financing wealth formation can be answered for each sector only as a whole, and not separately in respect of investments in fixed assets and in stocks of goods. For this purpose it is also necessary to include the formation of monetary capital through the acquisition of securities or of claims on banks, insurance companies or other sectors, for which purpose, just as for the formation of wealth in material assets, use is made either of the parties' own resources or of those of other parties. This method incidentally reveals the interlocking relations which exist between the various sectors and the financial institutions.

1) The Formation of Wealth by Enterprises and its Financing

The formation of wealth in material form by enterprises¹), in the shape of net investments in fixed assets and in stocks of goods, increased from DM 18,700 million in 1953 to DM 21,400 million in 1954, or by DM 2,700 million. In 1954 however the formation of monetary wealth in the shape of claims on other sectors and on financial institutions was not so great as in 1953. amounting to only a little over DM 2,500 million as against DM 4,300 million in that year. This decrease was chiefly due to the fall in time deposits and to the fact that, by comparison with the previous year, there was a much smaller rise in the amount of other resources - in particular "7 (c) monies" — that were made available to banks at medium and long term. On the other hand the claims on banks in the form of sight deposits did increase by more than in the year before; and in 1954 the amount of securities acquired, at an estimated total of DM 800 million, was roughly twice as great as in 1953.

Owing to the decline in the amount by which the claims increased, the overall formation of

¹) Amounts withdrawn by the self-employed for private purposes, and undistributed profits, can be ascertained only by the method of arriving at a residue. It is therefore possible that these amounts may contain relatively large errors of ascertainment.

¹) The investments of enterprises are reckoned for this purpose as including every increase of wealth in material form in the case of private and governmental undertakings, as well as in that of farmers, members of liberal professions and house-owners. The building of a single-family house is also regarded as an investment, and the possessor of such a house is deemed in that capacity to be an entrepreneur and so ranks among the enterprises.

Table 3: The Formation of Wealth by Enterprises ¹)

wealth by enterprises did not rise by nearly so much as the capital investments in fixed assets and stocks of goods; in fact, at a total of DM 23,800 million, it exceeded that for the previous year by only DM 700 million. Credits had to be taken by enterprises to the same extent because in 1954, as already mentioned, their undistributed profits were no greater than in 1953. The result was that in 1954 the proportion of overall wealth formation financed out of borrowed funds again rose, although by not nearly so large a margin as it had done in the two preceding years. The proportion of the total wealth formation in enterprises financed by the taking of credit in 1954 was in fact 63 per cent, as against 61 per cent in 1953 and 51 per cent in 1952. Only in 1950, in which year although the circumstances were different an increased tendency to economic expansion had also appeared, was the proportion financed out of outside funds slightly greater than in 1954 at 65 per cent.

In the composition of the credit taken by enterprises there were during 1954 certain changes, mostly in the direction of a further return towards normal in the credit relationships existing within the economy. This applies in the first place to the *direct credits* granted to enterprises by the other sectors. It is true that in terms of statistics it is possible to make statements only in regard to the direct credits granted by the Government and by foreign countries, while there is no evidence as to direct credits granted by households. It would seem that during 1954 the direct credits granted by the Government to enterprises, especially to enterprises concerned with housing, amounted to upwards of DM 2,000 million as compared with some DM 3,000 million in 1953. This decrease was due to the fact that in the said year the proportion of governmental credits transmitted through banks became greater, further details on this subject being given on pages 47/48. On the other hand there was no decrease in the total amount of credits granted by the Government.

There was a small increase in the amount of credit taken by enterprises other than banks and insurance companies by way of *issues of securities*, the amount so taken having reached DM 700 million in 1954 as against DM 600 million in 1953¹). It is true that the proportion of the total wealth formation of enterprises financed in this way, namely 3 per cent, was still extremely low. It is not until 1955 that financing through the securities market, especially through the issue of shares, seems to be again attaining substantial importance.

There was a considerable increase during 1954 in the amount of the credits extended by building and loan associations and by insurance companies

¹) The issues of securities which were made in connection with the Investment Assistance, and which were taken entirely by enterprises. have been left out of account as representing a taking of credit within one sector.

to enterprises, including parties ordering the building of single-family houses. Altogether during that year these institutions granted to enterprises DM 1,800 million of credits by comparison with DM 1,200 million in 1953. Accordingly the building and loan associations and the insurance companies financed 7.4 per cent of the total wealth formation of enterprises, whereas from 1950 to 1952 their share had been only around 4 per cent. These figures show that of late both the building and loan associations and the insurance companies have become very considerable providers of credit to enterprises, a category which also includes the parties - especially important in this connection — who order the building of individual homes. This was no doubt due to the substantial tax concessions which were allowed on payments by private households to building and loan associations and insurance companies. In the case of the insurance companies no doubt some importance also attaches to considerations of the income obtainable, since these cause them to lend out their surpluses direct on a larger scale without passing them to banks.

In 1954 the banks again occupied the dominating position as lenders holding titles to repayment, as distinct from the ultimate source of finance, this being found on the side of saving. In that year the increase in bank lendings to enterprises, including the so-called "transmitted" credits, amounted to DM 9,400 million as against DM 8,500 million in 1953, while these lendings served in 1954 to finance not quite 40 per cent of the total formation of wealth by enterprises as compared with 37 per cent in the previous year. Thus the indebtedness of enterprises to the banks grew during 1954 somewhat more than their formation of wealth; and the growth took place primarily in their long-term borrowings. which expanded by DM 6,400 million against DM 5,800 million in 1953. As already indicated, a substantial part of this growth was due to the fact that in 1954 a larger proportion of the total governmental credits was passed through banks. Besides this the increase in the banks' lendings at medium and long term was related to corresponding changes on the liabilities side of their balance sheets, in particular to the great increase in savings deposits plus the placing of bank bonds, which changes permitted great extension of the said lendings, especially for housing purposes.

As against this the addition to the short-term lendings of banks to enterprises was only slightly greater than in the year before, amounting to DM 3,000 million in 1954 by comparison with DM 2,800 million in 1953. The proportion of the financing of wealth formation in enterprises

Table 4: The Financing of the Formation of Wealth by Enterprises¹)

covered by short-term credits in 1954 was 12.8 per cent, which was not appreciably greater than in 1953. In 1951 and 1952 also an approximately equal share in the total financing of wealth formation was taken by bank credits at short term. Hence, remarkably enough, the increase in the proportion which financing with funds from outside sources to the total wealth formation by enterprises has attained during recent years, rising to 63 per cent in 1954 as against 51 per cent in 1952 and 39 per cent in 1951, was achieved not as a result of credits granted by banks at short term but solely through medium and long-term credits granted by banks, building and loan associations and insurance companies as well as through the issue of securities. The fact that the exceptionally high rate of selffinancing in 1951 and 1952 was brought down and that this method gave place to financing from outside sources at medium and long term no doubt betokens the start of a return towards normal in the financing of capital investment. The change-over from bank borrowing to credit obtained through the issue of securities, which is also desirable, had however as yet attained no significance worth mentioning during the period.

2) The Formation of Wealth by the Government and its Financing

The formation of governmental wealth in material and monetary form during 1954, at DM 12,900 million, was greater by DM 1,000 million than in 1953 and was double the amount so formed in 1950. In this connection the accumulation of *wealth in material form* through new capital investments accounted in 1954 for about DM 3,400 million, or 26 per cent of the total wealth formed by the Government, this being approximately equal to the proportion in the preceding years.

Much the greater part of the formation of wealth however represented increase in the monetary wealth, that increase having amounted to DM 9,500 million in 1954. As has already been briefly mentioned, the size of this overall total is due in the first place to the fact that all the claims which arose from the extensive lending schemes of governmental authorities are reckoned as part of the Government's formation of monetary wealth. This applies in particular to

the substantial sums which were made available for the finance of housing, as well as to the credits which were granted out of the Equalisation of Burdens Fund and the E.R.P. Special Fund. Besides this the very substantial addition to wealth in the form of reserves of the Social Insurance Institutions and the Unemployment Insurance Fund is also included in the Government's formation of monetary wealth, which amounted in 1954 to more than DM 2,000 million. By comparison with this the cash surpluses, reckoned as the difference between total expenditure including that on capital investment and lendings on the one hand and ordinary receipts on the other, are of only subordinate importance. For all the public authorities together, if the cash surpluses of the Federal Government and the Social Insurance Institutions are offset against the cash deficits of the other territorial authorities and of the Equalisation of Burdens Fund, they amounted in 1954 to only about DM 500 million¹).

About a third of all the claims acquired in 1954 are direct claims on the ultimate borrowers. Much the greatest importance attaches in this connection to the credits which were granted by public authorities to enterprises without the use of a bank as intermediary; these are estimated to have amounted in 1954 to DM 2,300 million by comparison with DM 3,300 million in 1953. As already briefly mentioned, this decrease is partly due to the fact that in 1954 the banks were brought to a greater extent into the business of granting fresh credits; but it also reflects the conversion into bank lendings of credits which had been granted direct to the ultimate borrowers. The direct credits must further be regarded as including the credits granted to West Berlin out of the E.R.P. Special Fund, as well as the credits granted to foreigners through participation in the International Bank for Reconstruction and Development and the International Monetary Fund, although in terms of size these latter were not a very important factor.

A much more important part in the formation of monetary wealth has however been taken by those claims which are on *financial institutions*. In very large measure these claims arise from the providing of funds to banks for the purpose of $^{-1}$) See the Report of the Bank deutscher Länder for the Year 1954, pages 72/73. transmission to the ultimate borrowers. In 1954 the amount concerned was DM 3,500 million, as against only DM 1,700 million in 1953. Besides this however the deposits of the Government grew during 1954 by the further considerable amount of over DM 2,000 million. It is noteworthy that during that year the increase in time deposits was smaller, but on the other hand the increase in sight deposits was greater, than in 1953. This difference between the trends reflects the way in which the formation of surpluses has become more concentrated in the Federal Government, this latter having invested its surpluses in temporarily repurchased Equalisation Claims, which for purposes of the present study are reckoned among the sight deposits. Finally a not inconsiderable part of the Government's formation of monetary wealth took the form of acquiring securities. The Social Insurance Institutions alone, which constitute the most important group of security purchasers among public authorities, increased their holding of securities by some DM 850 million in 1954. Besides this. other public authorities have also acquired securities. At all events it can be seen from the data as to the first takers of fixed-interest-bearing securities that during 1954 public authorities. including Social Insurance Institutions, bought securities worth DM 1,000 million. Since in present circumstances it is not to be assumed that the public authorities dispose on any large scale of securities once acquired, it would seem, especially since the amount of the large rise in the Social Insurance Institutions' security holding is known, that this figure must indicate with approximate correctness the increase in the total amount of securities held by public authorities.

Table 5:	The Formation of	Wealth by	the Government	and its Financing ¹)	
----------	------------------	-----------	----------------	----------------------------------	--

48

The financing of wealth formation in the case of the Government was effected in the first place out of what is called the "saving of the Government". This amounted in 1954, after deduction of the so-called transfers of wealth, to about DM 10,000 million and covered 80 per cent of the total wealth formation. In the preceding years also the share of the authorities' own resources in financing the Government's wealth formation had been approximately at this level, having even been as high as 90 per cent in 1951.

In 1954 the amount of credit taken by the Government was DM 2,600 million, of which however some DM 1,000 million represented indebtedness of the Equalisation of Burdens Fund to the banks in the form of Covering Claims in respect of compensation to holders of old savings, while the "actual" credit taken amounted to only DM 1,600 million. In view of the prima facie large size of the surpluses, however, it is fair to ask why credits on this scale were taken at all. In part the reason was that among the large number of public authorities which are here treated as a unit, but which in reality maintain cash funds independently of each other, there are some which closed the year with a deficit. In particular this applied in 1954 to the Equalisation of Burdens Fund, whose expenditure without counting the compensation to holders of old savings substantially exceeded the current receipts. In addition it is probable that in the case of certain territorial authorities, for example the local authorities, there was some advance raising of capital, the proceeds being held for the time being on bank accounts with a view to future use on capital projects. The amounts involved are however likely to have been a good deal smaller than in 1953, when in many cases advantage was taken, to an extent not justified by the requirements at the time, of the concessions which the Capital Market Encouragement Law permitted in connection with public securities.

There is clear evidence of this in the fact that governmental agencies showed greater reserve during 1954 in the *issue of securities*. In that year the placings of securities of public debtors amounted to only DM 370 million, or DM 200 million more if the Equalisation of Burdens Loan is included, against more than DM 700 million in the previous year. The borrowings by public au-

thorities from building and loan associations and from insurance companies, as well as the amount of short-term bank credit which they took, also remained within narrow limits in 1954. Greater importance attached only to the bank credits granted at medium and long term as regards the financing of the Government's formation of wealth. After deduction of the above-mentioned increase in Covering Claims on the Equalisation of Burdens Fund the amount of such credits granted in 1954 reached DM 1,400 million as compared with DM 1,100 million in 1953. No foreign credits were taken by governmental agencies, although on the other hand sums amounting to more than DM 500 million were repaid in connection with the London Debt Agreements.

3) The Growth of Claims on Foreign Countries and West Berlin

In 1954, in the same way as in the preceding three years, the country's economy as a whole achieved a considerable growth in its claims on foreign countries. As has already been stated in detail on page 41, the increase in such claims during 1954 amounted to DM 3,100 million. In this connection credits in the narrower sense of that term, in which the German Federal Republic functioned as an active grantor of credit, achieved a growing although by no means dominating importance. They amounted in 1954 to about DM 700 million as against DM 320 million in 1953. Much the greatest part of the increase in claims on foreign countries however took place in the form of growth in the stocks of gold and foreign exchange, which rose in 1954 by DM 2,500 million as compared with DM 3,600 million in the previous year.

Over and above this the blocked balances held in Western Germany by foreign creditors declined by DM 234 million. This had the effect of reducing the liabilities to foreigners, which for the position of net assets in relation to foreign countries must be regarded like an increase of claims. In 1954 and in the two previous years the total growth of claims as recorded by statistics was somewhat greater than the surplus on current items in the balance of payments, this being partly due to differences in point of time as between movements on the side of transactions

and those on the side of payments, and partly to errors of statistical ascertainment.

As has been already mentioned, the amount of credit granted by the area of the German Federal Republic to West Berlin and the Sovietoccupied zone has been exceeded during the last year or two by the credit which West Berlin has granted to Western Germany. In terms of statistics however it is possible to define clearly in this connection only a few important credit relationships. Thus, the credits granted out of the Federal budget, the E.R.P. Special Fund and the Equalisation of Burdens Fund to West Berlin are known in this connection, having amounted in 1954 to about DM 200 million as against DM 350 million in 1953. On an estimated basis it is also possible to work out the amount of the placings in Western Germany of securities issued in West Berlin, after offsetting West Berlin's purchases of West German securities; such net placings would seem to have amounted in 1954 to about DM 70 million. As to the granting of credit by West Berlin to Western Germany, which in terms of amount was much larger, it is possible to state an approximation only in regard to the net amount of credit granted by West Berlin to the banks in that area in the form of the increase in deposits at the Bank deutscher Länder and at banks outside the Central Banking System, as well as in that of purchases of money market securities and an increase in the amount of DM notes circulating. The said net amount probably reached some DM 160 million in 1954. The greater part of the credit granted to Western Germany however took the form of credits granted direct, especially by suppliers in West Berlin. For 1954, much as in the previous year, our estimate shows a residual item of about DM 400 million. This item may however contain substantial errors of ascertainment because in many cases the statistical delimitation as between West Berlin and the area of the German Federal Republic, which one is obliged to make primarily on statistical grounds, is found to involve extreme difficulty.

4) The Formation of Wealth by Private Households

The monetary wealth formed by private households amounted in 1954 to DM 8.600 million as against DM 6,700 million in the previous year and DM 2,400 million in 1950. This extremely large increase in private saving activity took place in highly varying degrees at the different financial institutions. Up till now the item of smallest importance in this connection has been investment in the form of securities, even though the security holdings of private households would seem to have increased by at least DM 600 million in 1954¹). Thus, it is true, saving by private households in security form has again attained a certain importance, whereas during the years up to 1952 the purchases of securities were quite insignificant, and it was not until 1953 that they rose to over DM 300 million. But, at 7.5 per cent, the ratio of such saving to the total formation of monetary wealth by the households still remained very low. At the building and loan associations and insurance companies, on the other hand, a much larger part of the private saving took place. In fact the private households during 1954 increased their claims on these institutions by DM 2,400 million as compared with DM 1,700 million in the previous year, the result being that the proportion of saving in this form rose from 25 to 28 per cent of the total formation of monetary wealth by private households.

1) The amount of securities acquired from subsequent takers has been taken into account on an estimated basis.

Much the greatest importance however continued to attach to the formation of monetary wealth at banks, which went up from DM 4,700 million in 1953 to DM 5,600 million in 1954. It is true that, if reckoned as a percentage, this growth was not quite equal to that in the other forms of investment, so that the increase in claims on banks accounted in 1954 for only 65 per cent of the total formation of wealth by comparison with 70 per cent in 1953. This relative decrease however did not affect the growth in savings deposits, which even in the previous year had already accounted for half of the monetary wealth formed by households. Only the growth in sight deposits and holdings of notes and coin is estimated to have been reduced from DM 1,100 million to DM 900 million. The order of magnitude of this item cannot however be precisely ascertained by statistical methods. One is therefore obliged to fall back on estimates, although the limits of error in these would not seem to exceed DM 200 million either way in the course of the year.

Much the greater part of the formation of monetary wealth by private households reflects saving by those households. At the same time transfers of wealth in the form of the compensation to holders of old savings made a substantial contribution to the total formation of monetary wealth in 1953 and also, more particularly, in 1954 when they contributed about one-eighth.

Table 8: The Formation of Wealth by Households and its Financing¹)

Finally among the sources of finance for private households mention must also be made of the taking of credit from banks in the form of instalment credits, which represent a kind of negative saving. Even in 1953 however such credits at a total of DM 360 million were not especially important; and in 1954 the amount declined to DM 270 million¹).

5) The Mutual Claims and Liabilities of Financial Institutions

In what has been so far written about the financing of wealth formation in the individual sectors the financial institutions, comprising banks, building and loan associations, insurance companies and the securities market, have been regarded as a unit. Consideration has therefore been given only to the changes in claims and liabilities as between the whole of the financial institutions on the one hand, and on the other hand the sectors comprising private households, enterprises, the Government and foreign countries, while the debtor-creditor relationships between the various groups of financial institutions have been left out of account. But the mutual financial relations, which were eliminated as duplication in the comprehensive statistical

¹) Not all the instalment credits granted by specialised institutions and other banks are to be regarded as consumer credits. A large part of them represents credits granted to minor enterprises for productive purposes, and these credits have therefore been counted as credit taken by enterprises rather than by households. treatment of the various institutions, are in themselves of great interest. They show in fact that there has been a very great increase in the extent of the financial interlocking between these institutions, especially during 1954.

In 1954 the mutual claims and liabilities of the financial institutions rose in each case by DM 6,200 million, whereas in 1953 the rise had been only DM 3,100 million and in 1952 no more than DM 2,100 million. This development of the mutual financial relationships arises mainly from the growth in activity of the securities market, in which the banks have been the most important factor both as issuers and as purchasers. In 1954 for instance three-quarters of the total placings of newly issued securities represented bank bonds alone, the amount involved being DM 3,600 million. On the other hand however the banks themselves have also been acquiring securities in constantly larger amounts, namely to the extent of DM 2,000 million in 1954 against DM 900 million in 1953. The insurance companies also enlarged their security holding in 1954 by more than DM 300 million. Since total placings of securities in that year reached DM 4,700 million, this means that nearly half of them were placed with financial institutions, while only DM 2,400 million were taken by the "sectors", comprising households, enterprises, the Government and foreign countries. This

greater engagement of financial institutions and especially of banks in the business of acquiring securities is mainly due — apart from considerations of taxation, which during past years were no doubt a factor of great importance — to the fact that private households are saving to a much greater extent than before the war "through institutions". That is why securities have been able to regain their former importance as a vehicle of investment for private savings only through the cooperation of the institutions that engage in savings business.

*) Alterations as compared with previously published figures are due, up to and including December 1954, to inclusion in the overall compilation of the to subsequent corrections. -1 Excluding Bank deutscher Länder and Land Central Banks. The figures cover all credit institutions (including R.L.C., cluding December 1954 credit cooperatives which had on 31 March 1948 a balance-sheet total of less than RM 2 million; as from January 1955 credit aggregate balance-sheet total is very small. -2 Not including branches rendering separate returns, which lie in the territory of a Land Central Bank their head office. Alterations are due, in general, to merging or liquidation of institutions, or to the establishment of new institutions. In the case of -4 Balances at less than four years. -5 After deduction of Equalisation Claims sold or redeemed. -6 The figures showing the holdings of Equalither RM period. -8 Includes Capital Depreciation Account, unpaid capital, own shares, etc., items for balance-sheet adjustment in respect of branches (Currency Reform. -11) Institutions established after the Currency Reform, such as the Landwirtschaftliche Rentenbank (Agricultural Mortgage Bank), justment in respect of branches located outside the Land. -13 Includes funds possibly contained in "Deposits" and earmarked for specific purposes, for Expelled Persons, and covering claims according to Art. 19 of the Law concerning Old Savings. -15 Increase partly due to conversion of direct credit cooperatives' obligation to render returns. Whereas up to and including December 1954 those agricultural credit cooperatives were required to the statistics whose balance-sheet total on 31 December 1953 was at least DM 500,000. This alteration involved only an insignificant change in the

of all savings and loan cooperatives, whereas the monthly statistics collected by the Central Banking System only cover some 1,500 such institutions: cf. Tables V, 1 (a) and VII, 3 (b). While the June and December figures are based on data collected from all agricultural credit cooperatives, the results for March and September have been estimated on the basis of sample statistics of the Deutscher Raiffeisenverband. - *) Excluding the three commercial banks affiliated with the Deutscher Raiffeisenverband, namely Hannoversche Landwirtschaftsbank AG, Hannover, Landkreditbank Schleswig-Holstein AG, Kiel, Südwestdeutsche Landwirtschaftsbank GmbH, Stuttgart, which in the monthly statistics of the Central Banking System are included in the group "State. Regional and Local Banks". - *) Claims on current account, including trade claims. V. Monthly Banking Statistics (Balance Sheet Statistics)

¹) Excluding Postal Cheque Office and Postal Savings Bank, but including Berliner Industriebank AG and, as from January 1955, including instalment credit institutions. $-^{2}$) Alterations arise through adding new credit institutions which are required to render returns, or through taking out credit institutions which are no longer required to render them. $-^{3}$) Cash, and balances at Berlin Central Bank. $-^{4}$) Balances at less than four years. $-^{5}$) After deduction of Equalisation Claims sold. $-^{6}$) Not identical with similarly named balance-sheet item. Includes all those items of the return which are not specified in the table. $-^{7}$) Includes funds possibly contained in "Deposits" and earmarked for specific purposes, which have not yet been passed on. $-^{8}$) Since January 1955 the instalment credit institutions, with a balance-sheet total of some DM 34 million, have been included in the compilation.

*) Alterations as compared with previously published figures are due to subsequent corrections. -1 Not including branches rendering separate returns, which lie in the territory of a Land Central Bank different from that in which their head office is located. The branches rendering separate returns have been counted as one institution together with their head office. — Alterations arise through liquidation or merging of institutions or through adding new institutions which are required to render returns. — ²) Not identical with the similarly named balance-sheet item. Includes all those items of the return which are not specified in the table.

*) Alterations as compared with previously published figures are due, up to and including December 1954, to inclusion in the overall compilation of the Reconstruction Loan Corporation, Postal Savings Bank and Cheque Offices, and instalment credit institutions. As from January 1955, alterations are due to subsequent corrections. -1) Excluding Bank deutscher Länder and Land Central Banks. The figures cover all credit institutions (including R.L.C., Postal Savings Bank and Cheque Offices, and instalment credit institutions), with the exception of small agricultural credit cooperatives (up to and including December 1954 credit cooperatives which had on 31 March 1948 a balance-sheet total of less than RM 2 million; as from January 1955 credit cooperatives whose balance-sheet total on 31 December 1953 was below DM 500,000). The proportion of the credit cooperatives thus disregarded to the aggregate balance-sheet total is very small. -2 Includes medium-term transitory credits. -3 Mortgages, loans based on communal security, other long-term lendings, and long-term transitory credits. -4 Increase in part due to conversion of direct lendings by public authorities (about DM 438 million of Lands' building loans) into bank lendings. -5 Cf. footnote 6, -6 Including increase of some DM 40 million due to transfer from the short-term lendings. -p Provisional figures.

¹) Credit institutions outside the Central Banking System. In the case of the agricultural credit cooperatives, partial statistics only (out of a total of some 11,000 institutions, the statistics cover about 1,450, which at the end of June 1955 accounted for more than half the credit volume of the agricultural credit cooperatives). — *) Stones and earths, flat glassware, sawmills and woodworking, building and allied trades. — *) The credits granted by the agricultural credit cooperatives not included in the figures (see note '), which at the end of June 1955 amounted to some DM 820 million, also probably represent, to a relatively large extent, credits to agriculture. — *) This includes all credits granted to public authorities, in so far as these are not shown among the individual branches of economic activity or industries, as well as the credits granted for the building and maintenance of roads, road bridges, harbours and waterways. — *) Credits granted to enterprise engaged in transport and communications, to the hotel and tourist industry as well as to "other private borrowers" and those designed to alford extra time for payment of freight charges. — *) Short-term credits: unclassifiable credits granted by private and public mortgage banks, credit institutions with special functions, and the former group "Other Credit Institutions"; and also, at the end of 1949, DM 126 million of unclassified converted RM credits. Medium and long-term credits: lendings made by credit institutions before the Currency Reform. — *) The breakdown of short-term lendings by branches of economic activity has been estimated on the basis of partial statistics collected from some 750 institutions. — *) Decrease due to dissolution of the group "Other Credit Institutions" in connection with the rearrangement of the breakdown by banking groups in January 1955.

*) By contrast with the data previously published in this table on the Federal Government's indebtedness, the liabilities of the Federal Government in respect of Equalisation Claims have now been included. — 1) The figures differ from the amounts published in the "Bundesanzeiger" (Federal Government Advertiser) at quarterly intervals inasmuch as the ascertainment of the Equalisation Claims of the Bank deutscher Länder and the Postal Savings Bank Offices as well as the Equalisation Claims established under the Supplementary Conversion Law was based on the amounts in the returns of the financial institutions and not on those reported by the Federal Debt Administration. The continual increase in the total amount is due to legal reasons and to the technicalities of conversion. — *) Not including indebtedness towards public authorities; also excluding the interest-free loam granted by the Bank deutscher Länder for the Federal Government's onservition and metang for the Federal Government's conversion and be interest-free loam granted by the Bank deutscher Länder for the Federal Government's soft the International Monetary Fund and the International Bank for Reconstruction and Development. — *) Including those non-interest-bearing Treasury Bonds which were passed on to the Lands in respect of financial adjustment payments.

2. Cash Results of the Federal Budget*)

*) Including West Berlin.

Differences from the figures shown in Table X, 1, "Offerings and Placings of Fixed-Interest-Bearing Securities and Shares" are due in the first place to the fact that that table represents sales statistics which do not take account of amortisations (totalling DM 116.4 million up to the end of August 1955). In addition, in that tabulation the Federal Railways 1949 Loan is shown at the full amount issued, namely DM 500.4 million, while in the above table the loan has been entered after deduction of the amounts temporarily converted into Special Treasury Bonds, which latter are shown in the following Table XI, 5. - 1) Previously published figures revised owing to the taking out of certificates of indebtedness. -s) Estimated.

from 1 July 1950 to 31 August 1955; in millions of units of accounts (\$)

¹) Net balance of all surpluses and deficits of a country (including E.P.U. interest, excluding use of "Existing Resources") during the period under report. <u>-</u>²) Net balance of all surpluses and deficits of a country (including E.P.U. interest, excluding use of "Existing Resources") since the beginning of the E.P.U. settlement. <u>-</u>³) The quotas shown are those applying at the end of the last clearing period indicated. The quota of B.I.E.U. as debtor is 864.0 million units of account. The quota of Greece as debtor is forzen. <u>-</u>⁴) Facilities made available to debtors (D) in excess of the quotas, on the basis of 75 p.c. gold and 25 p.c. credit, for covering deficits, or facilities which creditors (C) grant in excess of the quotas on the same basis. <u>-</u>⁵) Credits granted by creditor countries to E.P.U. (+), and credits granted by E.P.U. to debtor countries (...). Since the reorganisation of E.P.U. on 1 August 1955 (cf. Monthly Report of the Bak deutscher Länder for August 1955, p. 41 et seq.), the cumulative accounting position is, as a rule, the quadruple amount of the credit granted or used in each case. <u>-</u>⁰ The credit facilities correspond to the difference between a quatere of the total of quota and "rallonges" on the other. <u>-</u>¹) Including the revision of the figures for Belgium, France and United Kingdom resulting from the June 1952 settlement. <u>-</u>⁸) If the part of the "maximum lending obligations" exceeding the fixed rallonges is taken into account, the Federal Republic's liability to grant credits still amounts to 151.9 million units of account.
