Methodological notes

Content and analytical use of the financial accounts

The national financial accounts are an integral part of the German system of national accounts, a comprehensive set of statistics that mirror national economic activity. The national accounts have traditionally focused on providing a statistical picture of the goods and services produced in the economy in a given period and on the income generated in this connection. This “classical” focus on aggregate output and income has been progressively supplemented since the fifties by further sets of macroeconomic accounts. These include the financial flows account and the aggregate and sectoral financial balance sheets.

Financial accounts – supplementary refinement of the national accounts

The primary function of the system of national accounts is to schematically dissect the complex workings of the economy and its basic components and thereby to facilitate the task of economic analysis. The aggregate financial flows account supplements this picture by adding those transactions which occur in the financial sphere. The results of the financial flows account show by whom, on what scale, to whom and in which form financial resources were made available or taken up in an economy, and which financial intermediaries were involved in the financing cycle. In this way international institutions, national economic policy makers, associations, specialists at financial intermediaries and institutional investors and at research institutes gain an impression of the basic structure of the financial systems (i. e. of the channels through which financial assets are ac-

Function of the financial flows account

quired and financial resources are obtained in Germany) as well as of the financial behaviour of households, enterprises and government.

*Financial
balance sheets*

The financial accounts capture aggregate financial transactions during the period under review (in the financial flows account). Additionally, they record the amount of financial assets and liabilities on a given date (in the financial balance sheets), thereby contributing to the compilation of aggregate and sectoral balance sheets. This information is useful for analytical purposes in that economic behaviour is partly influenced by the level and structure of financial (and non-financial) assets and liabilities.

Benefits

The Bundesbank itself uses the results of the financial accounts to study the portfolio behavior of non-banks in addition to Monetary Analysis. Furthermore, shifts in the pattern of domestic financing are considered in detail. Its interest is mainly focused on the relationship between the credit operations of domestic banks, on the one hand, and the other sources of funding (securities markets, other financial intermediaries, insurance corporations and foreign lenders), on the other. Its aim is to expose the mutual links between the individual credit market and securities market segments. The Bundesbank – in addition to its business cycle analysis – looks at the pattern of asset acquisition and financing of enterprises and households, paying here special attention to the links with the real economy as represented by the national accounts data (especially capital formation and saving).

Publications

The Bundesbank began to develop and evaluate an aggregate financial flows account at a very early date. The first publication appeared in 1955, and since then the figures of the financial flows account have been commented on regularly in the Bank's Monthly Reports. In the course of further developing the original statistics, stock data on financial assets and liabilities of the individual sectors were published for the first time in 1971. Since then financial balance sheets have been part of the standard publication programme.¹ The complete yearly financial accounts appear at regular intervals as a separate Special Statistical Publication. Since the beginning of 2007 the current quarterly data of the sectors households and non-financial corporations have been published in the statistical section of the Monthly Report. (Additionally, the corresponding data for these and other sectors can be found in the time-series database on the Bundesbank's website.)

*Evolution of
the financial
accounts in
Germany*

This brochure shows the annual results of the financial accounts for the period 1991 to 2007. The data on financial flows and stocks have been compiled according to ESA '95, which is the binding standard also for the financial accounts of all EU member states.²

*Results based
on ESA '95*

¹ Concerning the compilation of integrated balance sheets for financial and fixed assets as well as the results 1991 to 2005 for Germany see in detail: Deutsche Bundesbank, Integrated sectoral and overall balance sheets for Germany, Monthly Report, January 2008, p 31-45.

² See Statistical Office of the European Communities, European System of Accounts, ESA 1995, Luxembourg 1996. In general ESA '95 closely follows SNA '93 (see United Nations, Systems of National Accounts 1993, New York 1993). However, ESA '95 is geared more towards EU-specific conditions.

One consequence of the associated changes in methodology and classification, however, is that the data are only partly comparable with those of previous publications.

*Improved
international
comparability*

The adoption of this new definitional framework ESA '95 not only ensures greater consistency within the overall system of national accounts but also concurrently improves the international comparability of the financial accounts. The changes with respect to the previous framework based on ESA '79 mainly concern the classification and definition of the sectors and of the financial instruments.³ In the following these changes are described in more detail in the individual sections.

Methodological structure

Linkage to the national accounts

*Link between
financial
accounts and
national
accounts*

As mentioned, the financial accounts – being an integral part of the overall system of national accounts – are closely aligned in respect of their methodological structure with the accounts system of the Federal Statistical Office. This manifests itself principally in the fact that the Bundesbank's financial accounts are preceded by data on the acquisition of non-financial assets and saving of the individual sectors – data that are based on the corresponding figures of the national accounts. The balances resulting from the acquisition of non-financial assets, on the one hand, and from saving plus capital transfers, on the other, show to what extent a sector was a net lender to or borrower from the other sectors. These net lending or net borrowing aggre-

gates normally correspond to the balances arising from the acquisition of financial assets and external financing of the individual sectors, the calculation of which is the centre-piece of the financial accounts.

Sectoral breakdown

The financial accounts show the financial relationships between all economic entities permanently domiciled in Germany. Foreign employees and the production sites of foreigners in Germany thus count as domestic economic entities, whereas German facilities domiciled abroad are regarded as non-residents and are thus assigned to the sector Rest of the world. Domestic entities are grouped in sectors according to their economic and financial nature (see the table on page 10). The system of sectoral classification used in the German financial accounts differs in some respects from that used in ESA '95. Whereas ESA '95 defines a sector Financial corporations and divides this into various sub-sectors, the German financial accounts define three separate sectors: Monetary financial institutions, Other financial intermediaries and Insurance corporations.

*Residence
concept and
classification
by sector*

The most important changes brought about by the harmonisation with ESA '95 relate to the reclassification of the domestic non-financial sectors. The new sector Non-financial corporations now solely comprises genuine corporations and so-called quasi-corporations

*Non-financial
corporations,
households*

³ For the details of the Bundesbank's financial accounts based on ESA '79 see Deutsche Bundesbank, Financial accounts for Germany 1990 to 1998, Special Statistical Publication 4, July 1999.

Classification of sectors

Domestic non-financial sectors

Households and non-profit institutions serving households

Non-financial corporations

(principally partnerships such as general partnerships (*Offene Handelsgesellschaft – OHG*) and limited partnerships (*Kommanditgesellschaft – KG*)). By contrast, sole proprietors and self-employed persons, whose entrepreneurial activities are indistinguishable from the transactions of private individuals, are classified as belonging to the sector Households. The same applies to purchasers of private residential property, who constituted the foremost group of investors within the former Housing sector. Under the classification system used in the “old” financial accounts (according to ESA '79), the housing sector was treated as a separate sub-sector of non-financial enterprises on account of its special financing structure.

As a consequence of the broadening of the household concept, the sector's saving ratio is now lower than before the reclassification⁴. This is due, above all, to the consumption of households' fixed capital in the form of depreciation to take account of loss of value caused by wear and tear. This tendency is reinforced by the relatively high level of external financing of business investments. The institutional reclassification of the Household sector results in a balance sheet extension in the financial accounts. Households' financial asset acquisition now includes the business balances of commercial non-corporations. In addition to consumer credit, household liabilities now also embrace housing loans as well as the incurrence of liabilities by self-employed persons and sole proprietors to finance their acquisition of fixed assets.

Households' saving ratio

By contrast, the general government sector is now defined somewhat more narrowly than before. The supplementary pension funds for government employees are no longer included under the sub-sector Social security funds but instead – like the legally autonomous pension funds of private-sector employers – under the sector Insurance corporations. This has tended to increase the reported level of households' financial asset acquisition in the insurance sector.

General government

The new classification of the sector Monetary financial institutions accords with the ECB's definition of Monetary financial institutions (MFIs) and comprises the Deutsche Bundes-

Monetary institutions and Other financial intermediaries

⁴ See Deutsche Bundesbank, Income, saving and capital formation in the nineties: results of the new ESA '95, Monthly Report, December 1999, p 49-62.

bank, the domestic credit institutions (banks and building and loan associations) and money market funds. The sector Other financial intermediaries mainly comprises open-end mutual funds (mainly securities-based funds and open-end real estate funds) as statistics on other financial intermediaries (including financial auxiliaries) are available only partially on a sufficient scale.

Recording of financial instruments

*Changes in line
with ESA '95*

In the financial account tables now compiled in accordance with ESA '95, the definitions of financial instruments (see the table on this page) are independent of the creditor or debtor sectors involved.⁵ Therefore, the different categories of deposits also include the balances of domestic sectors with foreign banks. Similarly, the item Loans comprises not only loans granted by banks and building and loan associations but also unsecured lending by other sectors (eg mortgages and other loans granted by insurance corporations or general government). In addition, the list of financial instruments has been extended in accordance with ESA '95 in two important respects so as to separately show financial derivatives and other equity (ie equity other than shares).

*Financial
derivatives*

Financial derivatives are financial instruments based on or derived from another instrument which allow special risks to be traded separately from the underlying instrument. The underlying instrument can be, for example, another financial asset (eg options on securities), an index (eg DAX futures) or a commodity (eg commodity futures). At present, the balance of payments statistics provide

data on cross-border net payments in connection with options and other financial derivatives. No data are available on such transactions between domestic counterparties.

The financial accounts now record not only shares but also participating interests in other corporations (private limited companies (*GmbHs*) and cooperative societies) and in partnerships. Although such enterprises account for a substantial amount of equity capital in Germany, given the particular structure of the business sector in this country, for statistical reasons such types of equity were not

Other equity

⁵ The breakdown by maturity is based on the maturity or period of notice originally agreed. Claims or liabilities payable on demand or with maturities of up to one year are normally regarded as short-term, while those with longer maturities are deemed to be long-term.

recorded in the "old" financial accounts. Using data derived from the Bundesbank's corporate balance sheet statistics plus additional data from the banking and balance of payments statistics, with the transition to ESA '95 a first attempt has been made to estimate the own funds accumulated by enterprises other than public limited companies (known as Other equity). But these figures are very tentative and only provide a somewhat more comprehensive picture of the overall level of equity financing in Germany.

Claims on insurance corporations, claims arising from company pension commitments

Claims on insurance corporations comprise (contingent) claims of policy holders which are mirrored in the balance sheets of insurance corporations and pension funds by corresponding insurance technical reserves. The item Claims arising from company pension commitments comprises company-based direct pension commitments, which are widespread in Germany. (According to ESA '95 these are likewise to be classified as Claims arising from insurance technical reserves.)

Other accounts receivable/payable

The item Other accounts receivable/payable comprises claims and liabilities that tend to be counterparts of other business activities, eg early or late payments for goods and services. This item includes enterprises' trade credits and prepayments/accrued income as well as government tax claims and payment arrears. With respect to the sector Households other accounts receivable also include accumulated interest-bearing surplus shares with insurance corporations.

Conceptual aspects

In accordance with international practice, the terms Acquisition of financial assets and External funding or Financial assets and Liabilities are defined rather broadly in the German financial accounts. Besides direct creditor-debtor relationships, they include financial operations in the form of shares and other equity, claims on insurance corporations and financial gold holdings, which are shown as a claim on the rest of the world. However, all other non-financial assets acquired as investments (collections, works of art) are disregarded.

Definition

In the framework of this special statistical publication the financial operations within a sector are generally offset against one another, ie consolidated. An exception are securitised claims and liabilities and shares. Both items are shown in principal even when they are recorded as opposite entries by entities in the same sector. Credit operations between sub-sectors of the same sector, while shown at sub-sector level, are consolidated at sector level. The totals for aggregates such as Domestic non-financial sectors, on the other hand, are obtained simply by summing the sectoral figures, ie they are not consolidated.

Consolidation

Financial flows are to be valued at actual transaction prices. In practice, this principle is often difficult to apply in cases in which stocks are shown at market prices rather than at their nominal value. It is most feasible to apply the transaction value principle wherever turnover statistics are available, for instance

Valuation of flows ...

in the case of issuance of securities at issue prices. If, however, the figures on the transactions are derived from stock data which include revaluations, the aspired valuation concept can only be applied if changes in the valuation of stocks over time can be eliminated.

... and of stocks

The predominant criterion for valuing stocks is market prices (or at least estimated market-related prices). In the case of unsecured claims and liabilities in domestic currency, this largely corresponds to nominal values. In the case of financial operations in the form of securitised creditor or debtor relationships (or equity) and in foreign currency, the daily market prices quoted in the securities and foreign exchange markets are to be used.

Valuation-related differences

The use of criteria other than the nominal value for valuing financial flows and stocks leads to valuation-related flow-stock discrepancies which, in the case of securities and foreign positions, may be significant. In such cases a seamless match between the recorded financial transactions and the changes in the stocks can only be achieved via an additional reconciliation account showing the audit trail between the initial position, transactions, valuation changes and the final position.

Net recording

Financial flows are shown net in the German financial accounts, ie the increases in claims (or liabilities) of a specific type are offset against the relevant decreases in the period concerned. This representational concept arises inevitably from the fact that stock statistics

frequently have to be used in order to derive the financial flows.

Statistical sources

Worldwide, there are hardly any separate collections of statistics for the specific purposes of the financial accounts, with the result that statistical information which primarily serves other purposes has to be used in compiling them. A case in point are the banking statistics, which are collected by central banks in connection with performing their monetary policy and prudential supervisory functions. The same applies to securities statistics for analysing the capital market and to various statistics for compiling the balance of payments. The financial accounts therefore assume the character of secondary statistics which are based on statistical components from diverse financial areas.

Financial accounts – secondary statistics

The information for compiling the financial accounts can be obtained in two ways: directly or indirectly. In the first case the data stem directly from the institution for which they are needed, in other words, from households or enterprises themselves. The second option is to obtain the desired data indirectly – ie from other sources, for example credit institutions or other financial intermediaries. Both methods have advantages and drawbacks. The direct method is often impeded in practice by almost insuperable psychological resistance, legal hurdles and high costs. On the other hand, the indirect method which is used in Germany has the advantage that one can draw on existing statistics which, on

Indirect information

account of the legal regulations, are fairly detailed, quite dependable and available without too great a time lag.

Main sources

The most important sources for the financial accounts are the statistics of financial intermediaries, particularly the monthly banking statistics and the quarterly data on the financial position of insurance corporations. The bulk of the stock data come from these sources, which sometimes also indicate the sectors in which the claims shown are concur-

rently incurred as liabilities and, conversely, the liabilities accrue as claims (counterpart information). Further data are provided by the capital market statistics and the securities deposit statistics, the balance of payments statistics, the international investment position, corporate balance sheet statistics and various government financial statistics. As noted, the national accounts figures on capital formation and saving of the individual sectors are taken from the Federal Statistical Office.
