■ Economic conditions

Underlying trends

German economy still lacklustre as 2019 kicks off

The German economy's underlying cyclical trend remained subdued at the beginning of 2019. This was due primarily to industrial activity continuing to cool. Manufacturing could thus dampen overall economic growth for the third consecutive quarter.¹ Following the decline in output in the second half of 2018 due to the introduction of a new emissions test procedure, major catch-up effects in the automotive sector are not expected for the current quarter. The downturn is likely to have continued in other industrial sectors. According to the ifo Institute, sentiment amongst enterprises in the manufacturing sector continued to deteriorate significantly towards the end of the period under review. By contrast, the construction sector and private consumption are probably buoying growth. The sharp rise in retail sales indicates that private consumption could pick up more clearly again. Consumers are benefiting from the continued positive labour market and income prospects. Furthermore, the fiscal measures which entered into force in the first quarter of 2019 are giving consumers additional leeway to spend.

Industry

Industrial output dampened through further decline in production of motor vehicles

Industrial output was in steep decline in January 2019. It was down by a seasonally adjusted 1¼% on the previous month, which had been revised upwards, and thus fell short of the average of the last quarter of 2018 by a similar figure. This was largely attributable to a fresh setback in the automotive industry (-5¾%), which had been hard hit by the introduction of a new emissions test procedure (Worldwide harmonised Light Vehicles Test Procedure: WLTP) in the second half of 2018. Excluding the automotive sector, industrial output stagnated,

however. The renewed dip in passenger car output is most likely due largely to production stoppages caused by a strike at an engine plant in Hungary. The wage dispute was resolved in January, however, and it is therefore expected that the recent losses in passenger car output will be temporary. This is also indicated by data on the numbers of manufactured passenger cars (available to February) provided by the German Association of the Automotive Industry. According to these data, in seasonally adjusted terms, the German automotive industry was able to recoup recent production losses and almost match the December level again. However, output still fell well short of the average number of units produced in the first half of 2018. In January, the production of capital goods declined steeply on the quarter (-1¾%) overall. By contrast, the output of intermediate goods (-½%) and consumer goods (-¼%) saw a significantly smaller contraction.

Industrial new orders dropped substantially in January 2019 and were down by 2½% on the previous month in seasonally adjusted terms. At the same time, the December figure underwent a similarly large upwards revision, however. This correction was mainly attributable to the manufacture of other transport equipment, which is characterised by large orders. The inflow of orders was also down by a substantial 2% on the quarter. In regional terms, the inflow of domestic orders was unchanged, but there were considerably fewer orders from the euro area and third countries than in the final quarter of 2018 (-3½% in each case). Looking at the individual sectors, German manufacturers of machinery, in particular, experienced weak demand (-5½%). New orders in the automotive sector were also down substantially (-3%), after a very strong rise in the fourth

Sharp fall in industrial new orders

¹ However, the uncertain indicator situation, which is reflected, for instance, in the huge upward revisions to new orders and industrial output for December 2018, make it more difficult to assess current industrial activity.

Deutsche Bundesbank

quarter of 2018. The decline in orders in this sector was solely related to the fall in orders from non-euro area countries, only few of which were affected by the introduction of the WLTP test. By contrast, orders of motor vehicles from Germany and the euro area were up substantially. This could be an indication that weaker demand from non-European countries may be masking the catching-up process in the automotive sector following WLTP-related production stoppages. The inflow of orders in the capital goods sector was down significantly overall on the quarter (-2¼%). Intermediate goods producers had to cope with a similar-sized decline. By contrast, consumer goods producers recorded a distinct rise in new orders (+½%).

Nominal industrial turnover did not follow lacklustre industrial output in January 2019, instead rising markedly on the month after seasonal adjustment (+½%), with even significantly stronger growth of 1¾% on the quarter. With regard to the regional sales markets, the increase is mainly derived from Germany and from non-euro area countries. By contrast, sales in the euro area declined slightly. In a sector breakdown, producers of capital goods recorded particularly strong sales growth. German manufacturers of machinery stood out here with a very significant increase, mainly in non-euro area countries. Furthermore, the consumer goods sector also reported substantial growth in sales. By contrast, intermediate goods producers sold significantly less in terms of value. In January 2019, nominal goods exports remained unchanged on the month after seasonal adjustment. They rose significantly on the quarter in both nominal (+1%) and price-adjusted terms (+1¼%). In January, nominal imports of goods rose steeply on the month and on the quarter (both +1½%) after seasonal adjustment. Excluding price effects, quarter-on-quarter growth was much stronger (+3%). The large discrepancy was related to prices for energy imports, which had fallen significantly at the end of 2018/beginning of 2019.

Industrial turnover up markedly in January, goods exports unchanged

Construction industry

Construction output up slightly in January

Construction output was up slightly in January 2019, rising by ¼% on the month in seasonally adjusted terms. It moved sideways compared with the average of the fourth quarter of 2018. While activity in the main construction sector contracted sharply by 3¾%, output in the finishing trades rose steeply (+3½%). In spite of the recent decline in activity in the main construction sector, capacity utilisation and the reach of orders in the sector are still close to their record highs according to surveys conducted by the ifo Institute. Other economic indicators also suggest that the construction boom in Germany is continuing. After seasonal adjustment there was an exceptionally strong and relatively broad quarter-on-quarter increase of 11¼% in new orders received by the main construction sector in the fourth quarter of 2018 – data are available up to this date. This increase was largely attributable to two major orders in commercial civil engineering, which are likely to lead to an expansion in construction activity only with some time lag. However, the inflow of orders in housing construction, which is not as dependent on large orders, was also up significantly on the previous quarter.

Labour market

Steep employment growth at beginning of 2019

The labour market is so far withstanding the slowdown in economic activity. Employment showed steep growth at the beginning of the year. After seasonal adjustment, the total number of persons in work in January rose by 79,000 on the month, which was significantly more than in the last months of 2018. Compared to the same month of the previous year, the increase was 477,000 persons or 1.1%. This growth was based essentially on the still substantial expansion in the number of employees subject to social security contributions, which rose by as much as 2.2% in 2018. By contrast, the number of self-employed persons and persons working exclusively in low-paid part-time jobs continued to go down. All indicators of

labour demand are expansionary. Labour market tightness, as can be derived from the ratio of unemployed to job vacancies or the average vacancy period, is also still very high.

Registered unemployment was down distinctly in February, following only a small decline in January. After seasonal adjustment, 2.24 million unemployed persons were registered with the Federal Employment Agency in February, 21,000 fewer than in January. However, due to rounding, the unemployment rate remained at its low level of 5.0%. The number of unemployed persons was down by 173,000 on the year. The weaker decline at the beginning of the year is due to an effect relating to labour market policy measures. Total underemployment including persons participating in labour market policy measures decreased evenly in the first two months of 2019. The unemployment barometer of the Institute for Employment Research (IAB) continued to fall and is now in neutral territory, which suggests unemployment will remain largely unchanged in the next few months.

Further decline in under-employment

Prices

In February, crude oil prices continued their recovery from the beginning of the year and rose markedly, mainly due to supply cuts. They were just over 8% higher than in January, but still slightly down on the year. As this report went to press, a barrel of Brent crude oil cost US\$67. The discount on crude oil futures was US\$¾ for deliveries six months ahead and US\$1½ for deliveries 12 months ahead.

Marked increase in crude oil prices in February

Import prices were down slightly in January. This was not only attributable to a clear decline in energy prices. The import of other goods also cost slightly less. Nonetheless, industrial producer prices in domestic sales increased moderately both excluding and including energy. The year-on-year change declined to slightly below 1% for imports and remained at just above 2½% for producer prices.

Import prices lower but producer prices nonetheless higher

The revision of the sub-index for package holidays and its impact on the HICP and core inflation

In February 2019, Germany's Federal Statistical Office published the results of the regular revision of the German consumer price index (CPI). With the shift to the new base year 2015, the weighting scheme was, as is customary, adjusted to reflect changes in consumption habits. In addition, the Statistical Office took the opportunity to undertake a number of methodological adjustments to the way in which pricing statistics are collected. In addition to rents, these amendments affected the prices of package holidays, in particular.¹ Previously, this component of consumer prices was based on seasonal weights, i.e. different weights at different times of the year, also taking into account different summer and winter destinations. However, it proved a disadvantage that it was impossible to interpret price developments particularly during the transition from summer to winter destinations and vice versa; on top of that, the separate

samples meant that it was not possible to compare the price level of summer and winter destinations.² In order to address these problems, additional year-round holiday destinations were included with the revision. This means that it is possible to switch to a procedure where weights are fixed throughout the year.³ A comparable approach is applied when determining CPI components relating to food, which contain seasonal products.

A comparison of the seasonal fluctuations in the new series of prices for package holidays with the old series shows that the seasonal peaks are now more pronounced in the summer. By contrast, the December figure, which generally marked the annual peak under the old methodology, is significantly lower than the summer peaks under the new methodology.

The altered seasonal pattern has considerable implications for the calculation of the Harmonised Index of Consumer Prices (HICP), which is, in principle, derived from the same dataset as the CPI. Unlike the CPI, where, for package holidays, the old and new series are chain-linked via the average of the base year, annual chain-linking is conducted using the December figure for the HICP.⁴ Since applying this rule means that the revised series is now

Revision of the HICP package holidays and impact on core inflation

2 See Deutsche Bundesbank, The volatility of the traditional core inflation rate in Germany, Monthly Report, November 2017, pp. 49 ff.

3 See, for example, D. Blang (2018), Geänderte Berechnungsmethodik für Pauschalreisen und die zukünftige Ausweitung durch automatisierte Abfragen, Presentation, 22nd conference "Messung der Preise", available online, in German only, at https://www.statistik-berlin-brandenburg.de/home/pdf/preise/2018/8_Blang_Pauschalreisen.pdf

4 Methodological changes may also be introduced for index calculation with the reporting month December.

based on the seasonal high of the old HICP series, the annual growth rates in the first year after the switch to the new methodology will tend to be overestimated. As the HICP is not normally revised, this would have meant that the annual HICP growth rate for 2019 would have been significantly distorted. In order to circumvent this problem at the current end, the official statistics body decided that the HICP sub-series package holidays, and thus the HICP for Germany and for the euro area as a whole, should be revised back to the beginning of 2015.⁵

However, annual growth rates in 2015 are now subject to the above-mentioned distortions. Whereas the average annual inflation rate in Germany was previously 0.1% in 2015 according to the HICP, it is now given as 0.7%. In the case of core inflation excluding energy and food, the methodological changeover even gives rise to an upward revision by 0.8 percentage point. Annual HICP inflation excluding energy and food in the euro area

works out at 1.1% in 2015, 0.3 percentage point higher than before.

In combination with the chain-linking method used, the switch in the seasonal pattern of package holiday prices as a result of the new data collection methodology consequently leads to distorted annual rates for 2015.⁶ Such changes to a key monetary policy variable that are attributable to purely statistical effects are extremely unsatisfactory and should be avoided where possible. In justified cases such as this, a more flexible approach to chain-linking would therefore be desirable.

⁵ See Eurostat, Improved calculation of HICP special aggregates and German package holidays methodological change, 22 February 2019.

⁶ A similar problem occurred in 2013 in the HICP accommodation services sub-index. For more information, see Deutsche Bundesbank, The contribution of the accommodation services sub-index to explaining the current deviations between CPI and HICP inflation rates, Monthly Report, April 2013, p. 7.

Consumer prices on the rise again

In February, consumer prices (HICP) were up by 0.2% in seasonally adjusted terms, after declining in the two preceding months. Food became markedly more expensive. It was mainly clothing that drove higher prices for industrial goods (excluding energy). The cost of services did not increase any further, partly due to price reductions for travel and holiday services. Rents continued to rise moderately. Year-on-year headline HICP inflation was still +1.7% (CPI +1.5%, from +1.4%). Excluding energy and food, it decreased from 1.8% to 1.5%.²

■ Public finances

Statutory health insurance scheme

The statutory health insurance scheme (SHI) ended 2018 with a surplus of €2½ billion (€½ billion less than in 2017).³ The health fund's balance increased by €1 billion, moving into posi-

tive territory (to +€½ billion). However, the surplus recorded by the health insurance institutions fell by €1½ billion (to +€2 billion). The institutions' financial reserves rose to €21 billion. Two-thirds of the institutions therefore have reserves above the statutory upper limit of one month's average expenditure. The health fund's reserve expanded to just over €9½ billion.

Health insurance institutions' revenue, largely comprising transfers from the health fund, rose by almost 3½%. This was almost 1 percentage point lower than in the previous year. The slight drop in the average institution-specific supplementary contribution rate (-0.05 percentage point with revenue shortfalls of just over €½ billion) had a dampening effect. In addition,

Health insurance institutions: subdued revenue growth amid increasing expenditure

Clear surplus and rising reserves in 2018

² With the rebasing of the CPI to 2015, CPI and HICP were revised up to 2015, with a significant impact on headline and core inflation in some cases, see the box on pp. 8 f.

³ Preliminary accounting figures compared with the final annual outturn (see the table on p. 10). By contrast, the chart on p. 11 shows comparisons of preliminary outturns.

Deutsche Bundesbank

the €1½ billion special grant paid out by the health fund in the previous year was not repeated. By contrast, healthcare expenditure increased by 4%, a slightly higher rate than in 2017. The number of insured persons went up by 0.8%. The large expenditure items of hospital treatment, outpatient treatment and pharmaceuticals rose by around 3%. Spending on remedies and therapeutic appliances increased sharply owing to significantly higher fees for healthcare professionals (7½%).

employment developments, and thus contribution receipts, being more favourable. Despite the slightly lower supplementary contribution rates, contribution receipts increased by 4%. Employees' contributions rose by 4½% due to positive wage and labour market developments. Pension contributions increased to a lesser extent (+3%). The central government grant remained stable compared with 2017. Spending (mainly transfers to the health insurance institutions) increased by 3½%.

Health fund: unexpected surplus due to favourable employment developments

However, result exceeds official SHI estimators' expectations

All in all, the health insurance institutions recorded a far better result than was expected in autumn 2017. Expenditure was much lower than their estimates suggested. In addition, the supplementary contribution rates did not, on average, fall to the rate deemed necessary by the Federal Ministry of Health at that time to cover relevant expenditure.

In autumn 2018, the official SHI estimators expected the health fund to break even this year. On the revenue side, income subject to compulsory insurance contributions is set to continue rising significantly. Growth in employees' contributions (just over 3½%) will be curbed by the lowering of contributions to be paid by self-employed persons with low incomes (-€1 billion). In view of the considerable expansion of pension benefits, a far sharper increase of 5½% is assumed for pension contributions. The

Health fund's result expected to be lower in 2019

The health fund also exceeded expectations with a small surplus thanks, above all, to em-

temporary deterioration in the macroeconomic outlook is likely to initially have, at most, a moderately adverse impact on contribution receipts, as these are largely dependent on the relatively robust labour market. On balance, payments made by the health fund to the innovation and structural funds,⁴ which were not included in the official SHI estimators' calculations, could cause the health fund to run up a deficit.

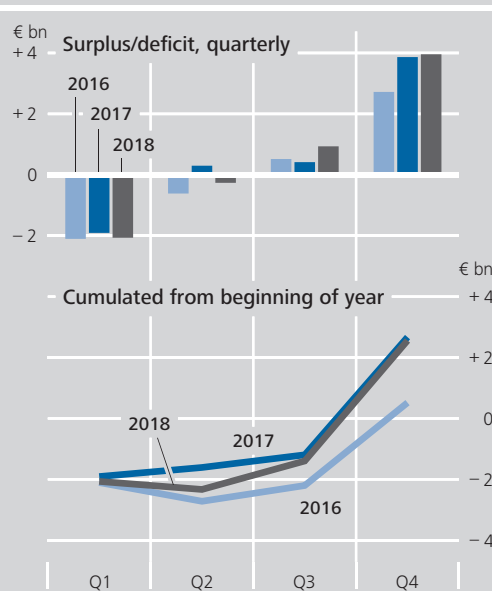

Health insurance institution benefits expanded, but another surplus possible

The official SHI estimators foresee an accelerated rise in spending of just under 4½% for the health insurance institutions. For example, hospitals have been reimbursed in full for the costs for additional nursing staff since the start of the year. This represents a departure from the usual system of lump-sum payments based on diagnosis-related groups, which are intended to support economic efficiency. Furthermore, the health insurance institutions will transfer just over €½ billion per year to the long-term care insurance institutions' equalisation fund to finance additional places for elderly care. The health insurance scheme is thus funding tasks performed by the long-term care insurance scheme. Factoring in these additional outlays, the Federal Ministry of Health calculated a reduction of 0.1% percentage point (to 0.9%) for the arithmetical supplementary contribution rate required, on average, to cover relevant expenditure. However, the actual average rate only fell to 1.0% at the start of the year. As a result, even in the face of new burdens arising from the Appointment Service and Care Act (*Terminservice- und Versorgungsgesetz*), there may once again be surpluses.

Desired lowering of contributions for occupational pensions would be accompanied by significant revenue shortfalls

There is currently debate as to whether to lower the contributions levied on occupational pensions and other pensions. This would put a heavy financial burden on the health insurance scheme. If these contributions were halved (as was the case prior to 2004),⁵ revenue of around €3 billion per year would be wiped out.⁶ This corresponds to revenue shortfalls amounting to around 0.2 percentage point of the contribution rate.

Finances of the statutory health insurance scheme*

Source: Federal Ministry of Health. * Health fund and health insurance institutions (consolidated). Preliminary quarterly figures. The final annual figures differ from the total of the reported preliminary quarterly figures, as the latter are not revised subsequently.
 Deutsche Bundesbank

Calls for lowering contributions are founded on the argument that contributions are currently levied twice over, i.e. they are levied in both the saving phase and the pension phase. However,

Justification for halving contribution rate unsatisfactory

⁴ The health fund makes scheduled payments totalling €½ billion per year from the liquidity reserve to the innovation and structural funds. The innovation fund provides annual funding of €300 million for healthcare innovations. Funding is divided equally between the health fund and the health insurance institutions. The structural fund promotes investment at the state government level to improve healthcare provision structures in the hospital sector.

⁵ Since the Act Modernising the Statutory Health Insurance Scheme (*GKV-Modernisierungsgesetz*) came into force in 2004, the full SHI contribution has been levied.

⁶ See Bundestags-Drucksache 19/4431 of 21 September 2018, p. 4.

Finances of the public long-term care insurance scheme*

cuts or raised contribution rates – which will weigh on macroeconomic development – even greater in future. It is important to not lose sight of this in the current debate.

Public long-term care insurance scheme

The public long-term care insurance scheme deficit increased by €1 billion to €3½ billion in 2018.⁹ Revenue rose by 4%, with employees' contributions increasing by just over 4½% and pension contributions going up by 3½%. At 6%, expenditure growth was much stronger than growth in revenue. The benefit rates were not adjusted last year. However, the second Act to Strengthen Long-term Care (*Pflegestärkungsgesetz II*), which put an enormous strain on the scheme's coffers in 2017, continued to drive up spending significantly. That said, this effect largely tailed off over the course of the year. The general reserves reached their peak at the end of 2016, hitting €9½ billion. By the end of 2018, they had shrunk to just under €3½ billion.

Increased deficit ate into reserves

At the start of 2019, the contribution rate was raised from 2.55% to 3.05% (plus an extra 0.25% in each case for childless persons). This will generate additional annual revenue of €7½ billion. Expenditure will increase on account of payments for additional nursing staff. However, the bulk of this will be covered by the health

Significant contribution rate hike will ensure surpluses for the time being

this occurs in only a few exceptional cases.⁷ As a general rule, transfers to institutions for occupational retirement provision (IORPs) and pension provision top-ups are not subject to SHI contributions.⁸ In this respect, it appears logical to subject occupational pensions and other pensions, such as deferred compensation, to contributions and to not lower contributions.

The currently strong financial situation, characterised by surpluses and high reserves, is masking foreseeable demographic pressure. It may appear possible to fund benefit increases or concessions in the short run. However, they would make the need for unpopular benefit

Financial situation to deteriorate in future

⁷ For example, in the case of deferred compensation for contributions to direct insurers, pension funds and pension schemes exceeding 4% of the maximum level of earnings subject to contributions in the statutory pension insurance scheme (western Germany) (Section 1(1) number 1 of the German Social Security Compensation Regulation (*Sozialversicherungsentsgeltverordnung*)).

⁸ See Deutscher Bundestag, Wissenschaftliche Dienste, Vermeidung der sog. „Doppelverbeitragung“ von Betriebsrenten aus Direktversicherungen und sonstiger Versorgungsbezüge in der gesetzlichen Kranken- und Pflegeversicherung – Aktueller Diskussionsstand und Reformpläne, 2016, pp. 5 ff.

⁹ Preliminary accounting figures compared with the final annual outturn. The developments outlined here exclude the long-term care provident fund, which has, since 2015, been recording surpluses as planned in order to accumulate assets. At the end of 2018, the accumulated reserves amounted to €5 billion.

insurance institutions in the form of transfers to the long-term care insurance institutions' equalisation fund. Overall, a significant surplus is expected for 2019. In view of the major contribution rate hike, surpluses are envisaged in the medium term, too. However, the greater the number of benefit expansions that are adopted, the faster the pressure stemming from demographic change to raise contribution rates will mount.

■ Securities markets

Bond market

High net sales in German bond market

At €129.8 billion, gross issuance in the German bond market in January 2019 was again significantly up on the previous month's figure (€58.1 billion). After taking account of increased redemptions and changes in issuers' holdings of their own debt securities, the outstanding volume of domestic bonds rose by €20.3 billion, following a drop of €31.4 billion in December. The outstanding volume of foreign debt securities in the German market grew by €13.9 billion, which meant that the outstanding volume of domestic and foreign debt securities in Germany in January increased by €34.2 billion on balance.

Rise in public sector capital market debt

The public sector issued bonds worth €10.6 billion net in the reporting month. Central government increased its capital market debt by €3.9 billion on balance. It issued mainly two-year Federal Treasury notes (Schätze) and Treasury discount paper (Bubills) (€6.9 billion and €5.3 billion respectively), but also five-year Federal notes (Bobls) on a smaller scale (€3.8 billion). This contrasted with net redemptions of ten-year Federal bonds (Bunds) totalling €13.2 billion. State and local governments issued bonds with a net value of €6.7 billion.

Net sales of bank debt securities

Domestic credit institutions raised their capital market debt by €8.4 billion net in January, following net redemptions of €9.3 billion in the previous month. This was mainly attributable to

Deutsche Bundesbank

debt securities issued by specialised credit institutions (€6.6 billion) and mortgage Pfandbriefe (€4.7 billion). By contrast, there were redemptions of other bank debt securities that can be structured flexibly coming to €4.4 billion net.

German enterprises, too, expanded their capital market debt in January (€1.3 billion). On balance, this was attributable to other financial intermediaries and insurance corporations, whereas non-financial corporations redeemed bonds in net terms.

Rise in enterprises' capital market debt

Foreign investors were the main purchasers in January, adding domestic debt securities with a net value of €24.9 billion to their portfolios. Domestic non-banks also purchased bonds for €9.5 billion net; ultimately, these were exclusively foreign securities. German credit institutions topped up their bond portfolios to the tune of €1.5 billion net; here, too, interest was focused on foreign securities. Following the termination of net purchases under the Euro-

Purchases of debt securities

system's asset purchase programmes at the end of 2018, the Bundesbank's securities portfolio was reduced by €1.7 billion net in January for operational reasons.

Equity market

Net issuance in German stock market

In the reporting month, domestic enterprises raised fresh funds of €0.7 billion on balance from placing new shares in the German equity market. Net issuance of foreign equities in Germany totalled €3.7 billion in the same period. Domestic non-banks were the main buyers, acquiring equities worth €6.1 billion on balance. By contrast, non-resident investors and domestic credit institutions sold equities for €1.6 billion and €0.1 billion net respectively.

Mutual funds

German mutual funds record inflows

Domestic mutual funds recorded inflows of €7.7 billion in January. Specialised funds reserved for institutional investors were the main beneficiaries (€6.2 billion). Of the various asset classes, funds were chiefly invested in mixed securities-based funds (€5.1 billion) and open-end real estate funds (€2.4 billion). Foreign mutual funds placed shares worth €3.7 billion in the German market in January. On balance, domestic non-banks were the sole purchasers of mutual fund shares in the reporting month (€13.8 billion). By contrast, there were net sales of fund shares by domestic credit institutions and non-resident investors in the amount of €1.3 billion and €1.1 billion respectively.

Balance of payments

Current account surplus down

The German current account recorded a surplus of €18.3 billion in January 2019. The result was down by €4.8 billion from the previous month's level. Although the surplus in the goods account expanded, the surplus in invisible current transactions – comprising the ser-

vices account as well as primary and secondary income – narrowed substantially more strongly.

In the reporting month, the surplus in the goods account expanded by €1.7 billion on the month to €15.1 billion. Exports of goods rose more sharply than imports of goods, with the increase of net exports under merchanting playing a key role.

Surplus in goods account up

In January, the surplus in invisible current transactions fell by €6.5 billion to €3.3 billion. In the secondary income account, the deficit slimmed; however, the primary income account and the services account saw their surpluses decline sizeably. Net receipts in primary income dropped by €5.2 billion to €9.2 billion. This was due, in particular, to the normalisation of other income following payment in December of the bulk of agricultural subsidies under the EU budget – as is standard practice at year-end. Services showed a net deficit of €0.9 billion after recording a surplus of €1.8 billion in December. The reason for the turnaround was the fact that income diminished by a greater extent than expenditure, with IT services and other business-related services of particular importance on both sides of the balance sheet. By contrast, in the secondary income account, the deficit narrowed by €1.4 billion to €5.0 billion. There were two key contributing factors: the decline in government expenditure, especially on current transfers relating to international cooperation and for payments to the EU budget in the context of financing related to gross national income, exceeded the decline in income; in addition, non-government sectors reduced their expenditure.

Lower surplus in invisible current transactions

In January 2019, transactions on the international financial markets were characterised by a wait-and-see stance with regard to the future orientation of monetary policy on both sides of the Atlantic, as well as by mounting evidence of the global economy cooling. Germany's cross-border securities transactions generated marginal net capital imports of €1.0 billion (December: net capital exports of €32.8

Portfolio investment sees net capital imports

billion). Foreign investors acquired German securities worth €22.2 billion net. Their demand was focused mainly on private and public sector bonds (€15.1 billion together) and money market instruments (€9.8 billion). However, foreign investors parted with equities (€1.6 billion) and mutual fund shares (€1.1 billion). Domestic investors purchased foreign securities worth €21.2 billion. They acquired – particularly euro-denominated – bonds (€9.0 billion), money market instruments (€4.9 billion), mutual fund shares (€3.7 billion) and equities (€3.6 billion).

Direct investment records net capital exports

Foreign direct investment on balance recorded net capital exports of €15.6 billion in January (December: net capital imports of €1.6 billion). Domestic enterprises increased their investment abroad by €18.8 billion. They expanded their equity capital by €12.2 billion, with reinvested earnings playing a key role. Intra-group credit transactions, too, saw funds in the amount of €6.6 billion flow out of Germany – mainly in the form of financial credit. Foreign firms injected capital into affiliated enterprises in Germany as well (€3.1 billion), increasing equity capital by €1.7 billion and granting additional loans amounting to €1.4 billion on balance.

Outflows in other investment

Other statistically recorded investment, which comprises loans and trade credits (where these do not constitute direct investment), bank deposits and other investment, saw outflows of capital in the amount of €2.3 billion in January (December: €5.5 billion). The banking system recorded net capital exports of € 4,6 billion. In this connection, the Bundesbank's net claims rose by €34.1 billion – mainly due to a reduction in deposits by non-euro area residents. This outweighed the decline in TARGET2 claims, which contracted by €98 billion in January. Minor outflows from government funds were also recorded (€4.7 billion). By contrast, enterprises and households were net importers of capital (€6.9 billion).

Reserve assets

The Bundesbank's reserve assets experienced marginal growth of €0.2 billion (at transaction values) in January.

Deutsche Bundesbank

■ German balance of payments in 2018

In 2018, the German economy's current account surplus decreased by $\frac{3}{4}$ percentage point to 7¼% of nominal gross domestic product (GDP). This was due to a sharp decline in the goods trade surplus, whereas developments in the other sub-accounts tended to push up the surplus. For instance, the slowdown in global trade growth hampered Germany's export performance, while goods imports rose sharply on the back of favourable domestic economic conditions. Furthermore, the steep rise in the price of internationally traded commodities diminished the goods trade surplus, as in the previous year. In terms of domestic saving and investment decisions, an increase in private investment against the backdrop of the fairly high aggregate capacity utilisation in 2018 was one of the main factors dampening Germany's current account surplus. Meanwhile, national saving as a percentage of GDP continued to increase during the reporting year.

As in previous years, some of these savings flowed abroad as net capital exports. At €225½ billion, however, this figure was significantly lower than in 2017. The gradual reduction of the monthly purchase volumes under the Eurosystem's expanded asset purchase programme (APP) also led to changes in portfolio investment. For example, foreign investors sold fewer German debt securities than in the years before; portfolio shifts by German investors in favour of foreign securities were also less pronounced. The Bundesbank's TARGET2 claims, which have been strongly influenced by the APP since 2015, increased only moderately in 2018. Commercial banks' external liabilities declined over the past year, having risen in 2016 and 2017 – in some instances as a counterpart to the Bundesbank's rising TARGET2 claims. In contrast to the global decline in direct investment flows, German enterprises continued to significantly expand their direct investment operations last year. On the other hand, Germany was also a sought-after destination for foreign direct investment (FDI). Euro area countries were the main partners for FDI in both directions.

Current account

Underlying trends in the current account

Decline in current account surplus for third consecutive year

Germany's current account surplus went down by €15½ billion to €246½ billion in 2018. In relation to nominal GDP, it fell by ¾ percentage point to 7¼%. As a result, after declining for three years, this put it significantly lower than its peak of 8½% of GDP in 2015.¹ As things stand, the current account balance will probably continue to decline until 2020.² Even so, it is likely that the threshold of 6% of GDP set by the European Commission as part of the pro-

cedure for preventing and correcting macroeconomic imbalances will continue to be surpassed.³

The decline in the current account balance masks divergent developments in its sub-items. On the one hand, the surplus in the goods account decreased. This was due to both price and volume effects. On the other hand, developments in the other sub-accounts tended to boost the surplus. For instance, the services account recorded a slightly smaller deficit. Moreover, the primary income surplus rose because the year-on-year increase in Germany's net external assets and the improved yield differential more than offset the dampening effect of the further drop in the yield level of foreign assets held by domestic investors. Finally, the deficit in the secondary income balance receded from the high level it had reached in the previous year as a result of one-off effects.

Decline in the goods trade surplus a key factor; surplus boosted by other sub-accounts

Germany's current account

As a percentage of GDP

Deutsche Bundesbank

Given the slow recovery of the global economy, German enterprises faced less favourable global economic conditions in 2018. In particular, global industrial output and the pace of world trade slowed markedly. On top of this, German exporters were confronted with an unfavourable regional export demand situation, meaning that, viewed together, growth in their sales markets in the advanced economies and the emerging economies even lagged behind growth in global trade during the reporting year. Export activity was also hampered by the further appreciation of the euro, whose nominal effective exchange rate against the currencies of the euro area's 38 most important trading partners (the EER-38 group) in 2018 was up

Global economic conditions less favourable

¹ For more information on the driving forces behind German net exports, see also the box on pp. 19 ff.

² See Deutsche Bundesbank, Outlook for the German economy – macroeconomic projections for 2019 and 2020 and an outlook for 2021, Monthly Report, December 2018, pp. 15-31.

³ In the in-depth review as part of the 2019 European Semester, the European Commission classified Germany as once again having macroeconomic imbalances. See European Commission, Country Report Germany 2019 including an in-depth review on the prevention and correction of macroeconomic imbalances, Brussels, 27 February 2019.

The drivers of German net exports from the perspective of a DSGE model

Microfounded dynamic stochastic general equilibrium (DSGE) models have become one of the established standard instruments of macroeconomic analysis.¹ Within this model framework, macroeconomic developments are the outcome of the individual behaviour of economic agents. These agents are assumed to make optimal decisions and to not make systematic errors when forming expectations.

In a DSGE model developed by the Bundesbank which covers a number of economic regions, it is possible to analyse Germany's international trade with other euro area countries and with countries from the rest of the world, which are assumed to have an independent monetary policy.² With regard to the analysis of net exports (i.e. the balance of trade in goods and services), two core elements of this type of model are of importance. The first is households' utility maximising decisions between current and future consumption, taking into account expected income and interest rates. According to this, households expecting their income situation to worsen in the future would, for example, already limit their current consumption, and this would tend to increase net exports. The second is that enterprises' investment decisions, which are also the outcome of an optimisation problem in the model, play a role in the development of net exports. This is because, from a macroeconomic perspective, net export surpluses can, for instance, reflect the reluctance of households and enterprises to consume or invest.

In the model, optimal consumption or investment decisions are adjusted if unexpected developments (shocks) occur. For

example, unexpected and persistently lower productivity growth could lead to a reduction in current private consumption, which tends to increase net exports. Using the estimated DSGE model, past cyclical fluctuations of German net exports can be attributed to the contributions of the underlying economic shocks.³

One thing the model does is cover shocks that originate in the German economy. These shocks relate to the fields of technology, savings, investment, public spending and wages. However, it also identifies the contributions of monetary policy shocks in the euro area, as well as those from combined shocks in the rest of the euro area and the rest of the world. This breakdown makes it possible to gauge the importance

¹ See, for example, L. Christiano, M. Eichenbaum and M. Trabandt (2018), On DSGE models, *Journal of Economic Perspectives*, Vol. 32, pp. 113-140; and Deutsche Bundesbank, Development and application of DSGE models for the German economy, *Monthly Report*, July 2008, pp. 31-46.

² For a detailed description of the model, see M. Hoffmann, M. Kliem, M. Krause, S. Moyer and R. Sauer, Rebalancing the euro area: Is wage adjustment in Germany the answer?, in preparation for publication as a Deutsche Bundesbank Discussion Paper. For a similar study of the German current account balance, see R. Kollmann, M. Ratto, W. Roeger, J. in't Veld and L. Vogel (2015), What drives the German current account? And how does it affect other EU Member States?, *Economic Policy*, Vol. 30, pp. 47-93.

³ These contributions include the initial impact of the shocks as well as potential follow-on effects in subsequent periods. The shock decomposition of net exports, which were the main reason for the increase in the current account surplus in the period since 2000, was carried out relative to gross domestic product (GDP). The other components of the current account balance are primary and secondary income. In addition, the ratio of net exports was mean-adjusted prior to the model estimation. The results therefore relate to fluctuations around the mean ratio of German net exports in the estimation period, which stretches from the second quarter of 1995 to the third quarter of 2018 and thus does not yet include changes as part of the 2018 annual revision.

Model-based shock decomposition of German net exports

In percentage points, annual data¹

¹ The annual data are based on the arithmetic mean of the quarterly ratios. The 2018 data relate to the first three quarters.
 Deutsche Bundesbank

of domestic and foreign factors in the development of German net exports.⁴

Between 1995 and 2015, German net exports increased from ½% to 7½% of GDP, with the bulk of this increase being concentrated in two periods of time. The first was from the beginning of the 2000s until the onset of the financial crisis of 2007/2008; the second covers the period since the start of the sovereign debt crisis in the euro area in 2011 until 2015.

According to the model results, the increase in the ratio of net exports in the 2000 to 2007 period was, as far as domestic determinants are concerned, for the most part attributable to additional savings, declining government spending, as well as the increasingly positive contributions of technological improvements. Among the external factors, developments in the rest of the euro area, which stimulated German net

exports, were a major factor in the latter's increase. In this context, a decrease in savings and additional government spending were among the important factors.

The further increase in the ratio of net exports in the period from 2011 to 2015 was related to a substantial additional build-up of economy-wide domestic savings and improvements in the use of production technologies. In addition, according to the model results, muted domestic investment and, to some extent, subdued government spending also contributed to this develop-

⁴ The path of the endogenous model variables is also influenced by the distance of the variables from the corresponding equilibrium values at the beginning of the observation period. In the historical shock decomposition, this is taken into account by the contribution of the initial condition.

ment.⁵ Other developments in Germany (Other DE), including changes in the price mark-up of tradable goods as well as to the share of tradable goods in overall consumption, also contributed to the increase in the surplus. The extraordinarily accommodative euro area monetary policy in recent years appears to have led to a slight increase in the surplus, probably also as a result of the induced depreciation of the euro exchange rate. Developments in the rest of the world also increased the surplus on balance. As in Germany, changes to the share of tradable goods in overall consumption as well as risk premium shocks were of importance here. By contrast, since the sovereign debt crisis, developments in the rest of the euro area have increasingly dampened German net exports. These include comparatively weak investment activity, higher savings and lower government spending. In addition, particularly subdued wage growth in Germany – even before 2011 – seems to have played almost no role in the increase in net exports.

Overall, the results presented support the hypothesis that the large and persistent surplus of German net exports is attributable to several factors. The accumulation of savings in Germany is one of the factors that has contributed to an increasing surplus over a prolonged period of time. This finding is consistent with the increase in economy-wide savings, which is attributable to a significant extent to non-financial corporations.⁶ Although weak domestic investment and low government spending also tended to increase the surplus, their quantitative effects were smaller. Moreover, according to the analyses, a considerable part of the dynamics of German net exports is attributable to external factors. However, this development reflects, at times, partly offsetting contributions stemming from the

rest of the euro area and the rest of the world over large stretches of the post-2000 period.

⁵ The results do not allow a distinction to be made between public and private investment. Furthermore, in light of the strong population growth, the finding that the dynamics of domestic investment have been comparatively strong since the first half of 2017 may have also been masked in the shock decomposition due to the per capita perspective chosen. See, for example, Deutsche Bundesbank, *The German economy*, Monthly Report, November 2018, pp. 44-53.

⁶ For more information, see pp. 24 ff. and Deutsche Bundesbank, *The savings of non-financial corporations in Germany*, Monthly Report, March 2018, pp. 20-22.

the growth in the volume of imports lagged slightly behind the figures recorded in the previous years, in line with the slackening pace of domestic growth. The increase in the price of goods imports, which was relatively strong compared to that of exports, meant that import growth outpaced export growth to an even greater degree in nominal terms than in real terms. As a result, the foreign trade balance decreased significantly in the reporting year. In purely mathematical terms, volume effects accounted for roughly two-fifths of the decline, and price effects for three-fifths.

In regional terms, the current account balance vis-à-vis other euro area countries fell by ¼ percentage point to 2½% of GDP. The decline was mainly due to a smaller surplus in the goods account, which overshadowed the reduced deficit in services trade. The current account balance vis-à-vis non-euro area countries dropped by ½ percentage point to 4¾% of GDP. This was mainly the result of a smaller surplus in the goods account, whose decline in comparison with the previous year significantly exceeded the improvement in the primary income balance.

Reduced surplus vis-à-vis euro area and non-euro area countries

by an average of just over 5% on the year. The euro mainly appreciated against the US dollar and the Swiss franc, but also against the renminbi and the yen. Germany's price competitiveness deteriorated somewhat as a result. Price factors also tended to dampen economic activity in Germany. For instance, the price of crude oil, in particular, rose very sharply. A barrel of Brent crude oil cost an average of US\$71 in 2018 – just under one-third more than in the previous year.

Price and volume effects dampened Germany's foreign trade surplus

Besides the less favourable global economic environment, in the second half of the year, problems in the automotive industry stemming from the introduction of a new EU-wide emissions testing procedure for new motor vehicle registrations weakened Germany's export performance.⁴ Although nominal goods exports expanded significantly overall, growth was below average compared to the previous years. Imports benefited from domestic economic conditions, which remained positive, although

Looking at the components of aggregate net lending/net borrowing, the fall in Germany's current account surplus relative to GDP was due to an increase in private investment in the context of fairly high aggregate capacity utilisation in 2018. This was mainly because business investment remained brisk and private residential investment increased again. By contrast, national saving as a percentage of GDP continued to grow in 2018, driven, in particular, by high levels of public sector saving. Looking at the balances of the individual sectors, the decrease in net lending by non-financial corporations played a major role in the decline in the current account balance. Saving by non-financial corporations, which had risen strongly

Increase in investment activity; aggregate savings on the rise

⁴ See Deutsche Bundesbank, The weakness of German motor vehicle production in the second half of 2018, Monthly Report, February 2019, pp. 47-48.

between the early 2000s and 2015, dipped slightly again in 2018 (see also the box on pp. 24 ff.). General government net lending increased considerably last year owing to sharp rises in social contributions and, above all, tax. Although significant in absolute terms, net lending by households remained broadly unchanged.

Goods flows and balance of trade

Foreign trade more subdued

German foreign trade activity was considerably more subdued in 2018 than in the year before. The slowdown in global trade, which had been extremely lively the previous year, had a particularly dampening influence on export activity. This was compounded by an unfavourable structure in terms of regions and product ranges, as well as the further appreciation of the euro. In price-adjusted terms, goods exports in 2018 virtually failed to surpass their level at the end of 2017. On an annual average, they nonetheless recorded an increase of 1¾% because exports had expanded considerably in the course of 2017. With regard to imports, foreign producers benefited from the ongoing buoyant domestic demand in Germany in the reporting year. Demand for machinery and equipment, which has a high import content, gained further momentum, which was particularly beneficial to manufacturers abroad. This partly offset the dampening effect on the demand for foreign goods that stemmed from the loss of momentum in German exports, which also have a relatively high import content. At 3% in price-adjusted terms, imports of goods rose distinctly more sharply than exports. Imports increased even more strongly in nominal terms, at 5¾%. The difference between the value of imports and exports, the latter of which went up by 3%, narrowed mainly as a result of the increase in the prices of energy products. On balance, the foreign trade surplus fell significantly by €20 billion to €228 billion in 2018.

Deutsche Bundesbank

On the corporate payout ratio in Germany

Increased savings of non-financial corporations played a major role in driving Germany's current account surplus to today's high level.¹ One key factor in this development in purely arithmetical terms, besides the increase in corporate profitability, has been the lower share of profits distributed to corporations' shareholders.² The aggregate payout ratio of non-financial corporations – measured as distributed income paid relative to net profits – has been on the decline since the beginning of the millennium.³ Coming to roughly 95% in 2001, this ratio has since dwindled by around 20 percentage points to 75% on average for the 2014-18 period, according to data reported in Germany's national accounts.

At the beginning of the last decade, the payout ratio in Germany was far higher than in the other countries of the euro area or European Union. However, neither these economic areas nor Japan, the United Kingdom or the United States have seen the average payout ratio decline significantly on balance. This would suggest that, to some extent, the strong contribution which the declining payout ratio of German enterprises has made to the rise in corporate savings over recent years also reflects a normalisation of sorts by international standards.⁴

Disaggregated data on the distributions of earnings by German enterprises based on the Bundesbank's corporate balance sheet statistics suggest that the decline in the payout ratio, rather than being confined to any particular size class, legal form or economic sector, has been a widespread development across Germany's corporate sector. While the decline has shown only minor differences in magnitude across firm characteristics, large enterprises and stock corpor-

ations generally had lower payout ratios than the other firm types. A comparison of the manufacturing and services sectors, on the other hand, showed no noteworthy differences in terms of the level of the payout ratio or the magnitude of its decline.

Besides descriptive analyses, it is also possible to use econometric estimates to identify which factors have been driving the decline in the payout ratio. These estimates subject common theories on the decline in the corporate payout ratio in Germany – including those suggested in the academic literature – to an initial assessment using suitable datasets and methods in each case.

Enterprises looking to deleverage

One possible theory for the decline in the payout ratio is deleveraging by German enterprises. These had relatively high leverage ratios by international standards at the end of the 1990s and have since made lasting

¹ See Deutsche Bundesbank, The German economy's current account surplus, Annual Report 2013, pp. 39-60.

² See Deutsche Bundesbank, The savings of non-financial corporations in Germany, Monthly Report, March 2018, pp. 20-22.

³ Net profits based on national accounts data were calculated in line with the net income/net loss for the financial year figures reported in corporations' income statements – that is to say, as net savings plus distributed income paid. The results look much the same if the payout ratio is modified such that net distributed income (i.e. distributed income paid less distributed income received) is used in the numerator or corporate profits (i.e. profits before taxes and net transfers) are used in the denominator.

⁴ In many advanced economies, non-financial enterprises' savings relative to their gross value added have risen strongly since the 1990s. See P. Chen, L. Karabarbounis and B. Neiman (2017), The global rise of corporate saving, *Journal of Monetary Economics* 89(C), pp. 1-19.

improvements to their equity capital base.⁵ To test this theory, relatively highly leveraged enterprises are compared with enterprises whose leverage ratios are on the low side in order to explore how their respective payout ratios have evolved since 2001 relative to the pre-2001 period; this assessment is based on individual data from German corporate balance sheets.⁶ If this approach finds that the payout ratio diverges more strongly as of 2001, it could be put down to the role played by corporate leverage. The econometric results support this theory, since the payout ratio of firms with relatively low equity ratios, and high levels of bank debt and long-term liabilities showed a particularly steep and statistically significant decline.

Cut in corporate tax rates in 2000-01

The corporate tax reform in 2000 and 2001 lowered corporate income tax to a uniform rate of 25%, down from pre-reform rates of 40% on retained earnings and 30% on distributed profits. Following the reform, it tended to be more attractive, in taxation terms, to retain profits as a means of funding new investment than to pay out profits and raise fresh equity capital. Furthermore, tax cuts tend, in theory, to diminish the tax benefits of debt financing.⁷ Thus, firms which had a high effective marginal tax rate prior to this reform might have reduced their payout ratio after the reform by more than other firms.⁸ According to the results of the same empirical approach as before, but with firms now being distinguished by their effective tax rate, the effects of the tax reform do indeed point in the expected direction. This approach finds no evidence of a statistically significant influence, however.⁹

Non-financial corporations' payout ratios*

Sources: Bureau of Economic Analysis, Eurostat, Cabinet Office of the Government of Japan, Federal Statistical Office and Bundesbank calculations. * Distributed income of corporations paid in relation to net profits (net savings plus distributed income of corporations paid). ¹ Excluding Germany. ² Excluding Germany and the United Kingdom.
 Deutsche Bundesbank

⁵ See Deutsche Bundesbank, Capital base of non-financial enterprises in Germany sustainably strengthened, Monthly Report, December 2013, pp. 44-46; and Deutsche Bundesbank, Trends in the financing structures of German non-financial corporations as reflected in the corporate financial statement statistics, Monthly Report, July 2018, pp. 57-67.

⁶ Balanced samples of firms were taken for the 1998-2005 period based on a difference-in-differences approach. The firm-specific payout ratio was regressed on a dummy variable for the period as of 2001 as well as on an interaction term composed of this dummy variable and the mean of the data for selected firm characteristics in the pre-2001 period. The estimated equation also includes fixed effects at the firm level.

⁷ See F. Modigliani and M. H. Miller (1963), Corporate income taxes and the cost of capital: A correction, American Economic Review, Vol. 53, pp. 433-443; and M. Faccio and J. Xu (2015), Taxes and capital structure, Journal of Financial and Quantitative Analysis, Vol. 50, pp. 277-300.

⁸ See D. Givoly, C. Hayn, A.R. Ofer and O. Sarig (1992), Taxes and capital structure: Evidence from firms' response to the Tax Reform Act of 1986, The Review of Financial Studies, Vol. 5, pp. 331-355.

⁹ One factor that might have a bearing here is that the firm-specific effective marginal tax rate used in the calculations is only roughly approximated using the relation of taxes paid to profits. There is also the difficulty of conceptually distinguishing between the effects of the corporate tax reform and those of deleveraging, if highly leveraged firms also tend to have higher marginal tax rates. See D. Givoly, C. Hayn, A.R. Ofer and O. Sarig (1992), op. cit.

Financing intangible assets

Intangible assets have become increasingly important on corporate balance sheets over the past few decades, to the detriment of tangible assets. Given that intangible assets tend to be pledged far less often than traditional capital goods as collateral for loans, the relatively high level of capital needed to finance them could also be reflected in increased corporate savings.¹⁰ However, based on the empirical approach – but this time with firms being grouped by their share of intangible assets to total assets – there is no indication that the increasing share of intangible assets has been instrumental in the drop in the corporate payout ratio.

Dividend smoothing

According to the empirical academic literature, firms believe that it is very important

to keep their payouts stable.¹¹ This would suggest that when a firm records rising profits, it will be hesitant to increase its payout level, with the result that its payout ratio will drop temporarily. The smoothing theory can be tested using another empirical model according to which changes in a firm's dividend payouts can be traced back partially to its profit level and partially to the dividends paid out in the prior period.¹² According to this model, the role which smoothing considerations play in dividend payouts is evident from a comparison of the dividend payouts computed by the model with those in a hypothetical scenario in which only current profits are a factor. Since the model finds that the payout ratios are similar in both cases, it appears that the intended smoothing of dividend payouts has not contributed a great deal to the decline in the corporate payout ratio in Germany.¹³

Substitution with share buybacks

For listed companies, share buybacks are another way of distributing profits to their shareholders.¹⁴ For the United States, there is evidence to suggest that corporate share buybacks have been used to substitute divi-

¹⁰ See A. Falato, D. Kadyrzhanova and J. Sim (2013), Rising intangible capital, shrinking debt capacity, and the US corporate savings glut, Finance and Economics Discussion Series 2013-67, Board of Governors of the Federal Reserve System.

¹¹ See J. Lintner (1956), Distribution of incomes of corporations among dividends, retained earnings, and taxes, American Economic Review, Vol. 46, pp. 97-113; and M.T. Leary and R. Michaely (2011), Determinants of dividend smoothing: Empirical evidence, The Review of Financial Studies, Vol. 24, pp. 3197-3249.

¹² See J. Lintner (1956), op. cit.

¹³ The calculations do point to the existence of smoothing considerations, but their contribution to the evolution of the payout ratio is extremely small, given its minimal importance for the average firm and profit growth at the firm level.

¹⁴ Reducing the number of outstanding shares available in the open market directly increases an enterprise's key measures of profitability (per share) and should, at least theoretically, push up its share price over time, with the result that, in principle, shareholders stand to benefit from share buybacks in the form of rising share prices.

dend payments, at least in part, since the 1980s.¹⁵ To gauge how much share buybacks have contributed to the decline in the payout ratio in Germany, it is possible to calculate a payout ratio adjusted for share buybacks.¹⁶ While there have been some years in which this ratio was considerably higher than the standard measure, the differences were immaterial on average for the 1998-2017 period. Arguably, then, share buybacks did not contribute to the trend decline in the payout ratio in Germany.

Conclusion

In conclusion, out of the five hypotheses investigated in this box, just one – the deleveraging theory – is identified as having a statistically significant and quantitatively important influence on the decline in the payout ratio. Given that debt levels in Germany's non-financial corporate sector are

now relatively low by international standards, there is little reason for enterprises to reduce their payout ratios any further.¹⁷ Now that enterprises are very soundly capitalised, it would certainly be plausible for them to further increase the share of profits they distribute in the future (as the national accounts data have been indicating since 2015).¹⁸

Weaker rise in price-adjusted exports by region

In regional terms, year-on-year growth in the value of exports to the most important target countries and sales regions was generally less buoyant on average in 2018 than in 2017. This was also the case in price-adjusted terms, according to which exports to the euro area increased by 3% and to countries outside of the euro area by 1¼%. Viewed over the course of the year, the relatively weak performance of price adjusted regional exports in 2018 becomes clearer. Although exports to euro area countries in 2018 rose by 1¾% until the final quarter in nominal terms compared to the last quarter of 2017, in price-adjusted terms, they exceeded this level by just ¼%. Exports to non-euro area countries grew by a nominal 1¼% over the same period; however, at last count, they were nonetheless ½% lower than in the fourth quarter of 2017 after adjustment for developments in sales prices.

Turning to nominal exports to EU countries, the annual average figures showed a particular de-

cline in exports to the United Kingdom. Product range effects, the slowdown in growth in the United Kingdom, and the significant appreciation of the euro against the British pound in the years before probably had a dampening effect here. Exports to France were also slightly down on the year, with the decline in other transport equipment also playing a role.⁵ By contrast, exporters maintained the successful performance they had achieved in the Netherlands and Italy in 2017. The increase in revenue from German exports to central and eastern European countries outside the euro area was higher than average, as in previous years.

The increase in the value of exports to countries outside the EU was also more subdued on

Loss of momentum in exports to EU countries ...

... and to non-EU countries

⁵ Ships and boats, railway locomotives and rolling stock, as well as aircraft and spacecraft, in particular – especially for the bilateral trade flows of the countries involved in the joint European manufacturing arrangement – play a major role in Germany's foreign trade in other transport equipment.

the whole on average in 2018 compared to 2017. Even so, broken down by sales region, developments were fairly heterogeneous. After increasing sharply the year before, exports to the United States recorded a moderate rise; the appreciation of the euro against the US dollar is also likely to have played a role here. In addition, exports to other major destinations outside the EU expanded only slightly. Exports to Russia, too, were only marginally higher than in the previous year, in which they had risen extraordinarily sharply. Furthermore, exports to the OPEC countries showed a further decline. Exports to Asia, on the other hand, recorded comparatively strong growth. Sales to China rose sharply, although the slower pace of economic activity there probably had an impact on German exporters. Export revenue in the South and East Asian emerging market economies expanded sharply again. Foreign business with Japan was also fairly positive.

The slower pace of global trade in goods affected German manufacturers to varying degrees. In price-adjusted terms, foreign trade in consumer goods was just as brisk as in 2017. The very sharp increase in sales of pharmaceutical products probably also contributed to this. Although Germany's exports of intermediate goods and major categories of capital goods also expanded, their rate of growth was distinctly lower than in the previous year due to weakening upward momentum in global industrial activity. Exports of computers, electronic and optical products as well as electrical equipment registered strong gains. In addition, exports of machinery rose comparatively sharply. By contrast, there was a clear decline in exports of motor vehicles and motor vehicle parts. Among other reasons, this was probably due to the difficulties encountered by the German automotive sector with regard to the new EU-wide emissions tests.⁶ This is likely to have been compounded by dampening effects from the demand side, especially in key markets for

Demand for wide range of export products, but motor vehicle exports in decline

⁶ See Deutsche Bundesbank, Monthly Report, February 2019, op. cit.

the German automotive industry. For instance, there was a significant drop in exports of motor vehicles to the United States, as in the previous year.

facturers in the euro area's partner countries saw revenue from their business with Germany expand to a significant degree, outstripping the previous year's performance. The pick-up in import demand from Germany benefited the major suppliers – with Italy and the Netherlands recording the largest increase overall – as well as the majority of smaller trading partners, which also significantly stepped up their deliveries. Furthermore, imports from central and eastern European EU countries went up relatively sharply, continuing the trend from the previous years. By contrast, imports from the United Kingdom were only slightly higher than their level in the previous year, when they had increased strongly. Major suppliers outside the EU also generated higher export revenues with Germany. However, the increases were generally lower than in the previous year.

Need for wide range of imports

Buoyant domestic demand in Germany meant there was demand for a wide range of products from foreign manufacturers. Imports of consumer goods continued to record lively growth. Imports of traditional capital goods such as machinery expanded considerably in the wake of the strong increase in demand for machinery and equipment in Germany. Computers, electronic and optical products as well as electrical equipment were also in high demand. By contrast, imports of motor vehicles and motor vehicle parts showed below average growth. This could have been due, among other things, to a certain degree of temporary spending restraint on the part of domestic buyers and, indirectly, the decline in motor vehicle exports. Producers of intermediate goods recorded very strong growth in revenue from exports to Germany. Moreover, the value of energy imports rose extremely sharply. However, this was essentially due to the increase in the prices of these products.

Invisible current transactions

From Germany's perspective, cross-border trade in services continued to post a deficit. Interestingly, the pace of growth in both imports and exports of services was very moderate compared to the strong performance of recent years. In contrast to both preceding years, the deficit decreased distinctly in 2018. During the reporting period, demand for ser-

Deutsche Bundesbank

Trade in services was brisker in 2018 than in the year before, particularly in services that tend to be knowledge-based, such as communication and IT services and the use of intellectual property, but also in the transport sector. These three sub-accounts significantly helped to improve the services account balance overall. By contrast, other business services, which include research and development, professional, technical and commercial services as well as management consulting services, showed very little momentum on the revenue and the expenditure side alike. Over the last decade, these services had shown very sharp growth in some cases as a result of the increasingly international division of labour in the services sector, too. The same applies to cross-border fees for financial and insurance services.

Above-average growth in knowledge-based services and transport sector

The largest item in the services sector in absolute terms is cross-border travel, which recorded a deficit of €43½ billion. Sharp increases in residents' income over the past few years saw travel expenditure go up by almost one-tenth in 2017. This high level was exceeded by only a small margin in 2018. There was barely any change in terms of travel destinations. Since Germany became somewhat more attractive as a travel destination for non-residents, the deficit remained virtually unchanged on the year.

Little change in travel services

vices provided by non-residents came to €19½ billion more than demand for services in Germany by non-residents.

The decline in the deficit in the year under review was solely due to the increased revenue from trade in services with other euro area countries, against which Germany's services account traditionally shows a deficit. Business-related sectors and sectors oriented to economic activity, such as manufacturing, transport, communication and IT services, played a major role in this. By contrast, Germany recorded a slightly lower surplus in the services balance vis-à-vis non-euro area countries.

... because revenue vis-à-vis the euro area increased

The primary income received by Germany from the rest of the world, which comprises compensation of employees, investment income and other primary income, exceeded payments in this item to the rest of the world by €91½ billion last year. As cross-border flows in compensation of employees and in other primary income offset each other to result in small balances as in previous years, net revenue from international investment was the main source of primary income. According to provisional calculations, this went up by €11 billion to €93½ billion in the reporting year, having already risen sharply in the three years before

Considerable rise in the investment income surplus

that.⁷ Although income to residents from their investments abroad rose only slightly, payments to non-resident investors and lenders – particularly in the area of portfolio investment – fell perceptibly year on year. At the same time, the yield level for both assets and liabilities declined further.⁸ However, because the decline in holdings of foreign assets by residents was smaller than that for liabilities, the yield differential widened to the advantage of German investors. Together with the further increase in net external assets, this contributed to the higher investment income surplus.

Partial absence of one-off effects reduced deficit in secondary income balance

The cross-border secondary income balance recorded a deficit of €47½ billion in 2018. This was lower than the deficit in 2017, which was strongly affected by one-off effects from private unilateral transfers to the rest of the world. Compared with 2016, in which there were no such one-off effects, the deficit in secondary income rose by almost €7 billion in the reporting year. Around one-third of this increase was attributable to the secondary income balance in the general government sector, mainly as a result of higher expenditure abroad. This was caused by the hike in Germany's contributions to the EU budget, which are based on gross national income. Two-thirds of the increase stemmed from the private sector, with one-off effects from private unilateral transfers to the rest of the world persisting in 2018, too, in some cases. The rise in the number of personal transfers – in this case, remittances – over the last two years also goes some way towards explaining the increase in private transfers to the rest of the world.

■ Financial transactions

In 2018, Germany's current account surplus was offset by net capital exports in the amount of €225½ billion, a drop of €57½ billion from the previous year's level, with all financial transactions segments recording net outflows of funds to the rest of the world.

Portfolio investment in Germany

¹ Increase: +, decrease: –.
 Deutsche Bundesbank

Portfolio investment

Portfolio investment generated net capital exports of €113 billion in 2018, compared with 196½ billion one year earlier. This substantially lower figure was caused, on the one hand, by reduced demand for foreign securities on the part of German investors and, on the other hand, by less divestment of German portfolio assets on the part of foreign investors than in 2017. The decline in demand for foreign securities may have been shaped by the expectations of market participants with regard to global growth, which were gradually reined in over

Continued capital exports recorded in portfolio investment

⁷ Final figures for direct investment income are not available until two years after they have been received and the reports they are based on have been examined – currently, this means up to and including 2016.

the course of last year. Geopolitical risks may also have played a role in German investors' decision to invest less strongly in foreign paper. These risks encompassed, for instance, the trade dispute between the United States and China as well as the ongoing uncertainty surrounding Brexit.

Last year saw domestic investors acquire a net €68 billion worth of foreign securities, putting net purchases well below their level one year earlier. While in 2017 German investors continued to chiefly focus on buying mutual fund shares, in 2018 their main focus of investment was interest-bearing instruments. Despite this, they acquired bonds worth €44½ billion, keeping demand only slightly above the previous year's level. Euro-denominated bonds were subject to greater demand from domestic investors, a development which, among other factors, may have been attributable to the wider yield spread of long-term government bonds of individual euro area member states over Bunds. Thanks to the higher yields on offer, these bonds are likely to have become more attractive to investors, notwithstanding the additional risks they can entail. Conversely, German investors sold foreign currency bonds in the amount of €3 billion in 2018, having purchased foreign currency bonds for €18½ billion just one year previously. Moreover, German investors shed foreign money market paper to the tune of €4½ billion from their portfolios after already having started to dispense with such short-term paper just one year before, owing to the widespread low short-term interest rates that have led to less than attractive returns.

German investors' chiefly interested in euro-denominated bonds

Foreign shares continued to be popular with German investors in 2018. However, at €9½ billion, net purchases were down on the previous year. After two years of posting significant gains, the international stock markets saw share prices plummet in some cases in the past year, prompting investors to exercise restraint with regard to equities.

In 2018, German investors also stepped up their indirect investment in securities, buying €18½ billion worth of them through foreign investment funds. Nevertheless, they acquired far fewer mutual fund shares than in 2017. Mutual fund shares were purchased mainly from Luxembourg and Ireland, where a large proportion of the companies that sell funds in Germany are based. From these locations, they invest funds on a worldwide basis, for which reason no regional classification of the actual target countries is possible.

Foreign investors part with fewer public sector debt securities

As regards financial flows in the opposite direction, at a level of €45 billion, foreign investors parted with far fewer German securities net in 2018 than in 2017. This was true, inter alia, for public sector bonds, where such sales by foreign investors amounted to €51 billion in 2018. This was well below the previous year's level. In this context, the gradual reduction of the volume of assets purchased under the APP is likely to have played a pivotal role. At the beginning of 2018, the Eurosystem initially scaled back its monthly asset purchases from a prior rate of €60 billion net to €30 billion, before trimming them again to €15 billion as of the fourth quarter onward. Accordingly, the Bundesbank's own purchases of assets, which, to a significant extent, were concluded with foreign counterparties, also contracted.

Bank bonds in demand abroad

In contrast to public sector bonds, interest-bearing securities issued by private entities domiciled in Germany met with positive demand from foreign investors. This meant that there was a reversal from the situation in 2017 on the back of a strong demand for bank bonds. While foreign investors in that year had continued to unload German bonds from their portfolios, in 2018 they availed themselves of securities of this kind for €6½ billion, also purchasing domestic money market paper totalling €2 billion. Foreign investors, meanwhile, divested themselves of bonds issued by German firms to the tune of €3½ billion.

Major items of the German balance of payments

With respect to shares, purchases by foreign investors in 2018 resulted in inflows of €6½ billion, as opposed to the previous year's result when non-resident investors sold German shares for €½ billion. In the main, domestic shares were bought by investors based outside the euro area. By contrast, non-residents dispensed with German mutual fund shares totalling €6 billion. This continued the trend of the previous year that had seen non-resident investors redeeming mutual fund shares for €2 billion.

Financial derivatives, which are aggregated to form a single item in the balance of payments, recorded net capital exports of €23½ billion in 2018. As a result, the balance widened substantially in year-on-year terms.⁹ Around four-

Financial derivatives activity leads to outflows

⁹ Since 2012, financial derivatives trading has mostly delivered net negative cross-border payment flows, a large proportion of which have been linked to interest rate swaps concluded by domestic credit institutions to hedge fixed-income securities against interest rate risk.

Deutsche Bundesbank

fifths of the recorded capital outflows were accounted for by futures transactions, with options generating the remaining one-fifth. Cross-border forward and futures contracts relating to electricity and gas, which are also recorded under financial derivatives, resulted in net capital imports totalling €½ billion. Monetary financial institutions constituted the majority of the domestic counterparties engaging in internationally traded financial derivatives.

Foreign direct investment

Global direct investment flows declined in 2018 for a third year in succession. This deterioration was triggered by a number of factors, including the worsening trade dispute between the United States and China, uncertainty about the specific aspects of the United Kingdom's withdrawal from the EU, as well as the reform of the taxation rules for US enterprises with affiliates located abroad. Tax reforms in the USA caused much of that country's direct investment capital abroad to be repatriated, which, in and of itself, had the effect of diminishing net direct investment flows. The return flows recorded of late represented previous years' profits generated abroad that had not been distributed but instead reinvested in foreign branches, thus enabling parent companies located in the United States to evade taxation.

Decline in global direct investment

The capital flows heading to the United States as a result of the repatriation of reinvested earnings overshadowed other developments in the arena of global direct investment in 2018. Corporate acquisitions and mergers went up by 19% in terms of value in 2018. The number of proclaimed start-ups of commercial affiliates located abroad, known as greenfield investments, increased by as much as 29%.

All in all, the United Nations Conference on Trade and Development (UNCTAD) estimated that global direct investment transactions in

2018 had sunk by around 19% to a figure of US\$1.2 trillion.¹⁰

Germany: Increase in foreign direct investment (FDI) in both directions

In contrast to the downward trend witnessed in direct investment in other advanced economies, international capital links with German involvement expanded once more. In this context, German enterprises significantly increased their foreign investment, with large scale direct investment in Germany occurring in parallel to this.

Overall, German net capital exports from direct investment in 2018 came to €43½ billion, compared with €48½ billion over the preceding 12 months. This result stemmed from German FDI abroad, which rose by €9½ billion to €132½ billion to reach an all-time high. Domestic companies boosted their equity capital abroad particularly sharply (€140 billion),¹¹ and a sizeable role was played by cross-border mergers and acquisitions.¹²

By contrast, German enterprises saw inflows of funds amounting to €7½ billion via intra-group credit transactions. This reflected the fact that foreign affiliates had been redeeming financial credits granted to them by their German parent company.

Distribution remains the key factor driving direct investment

Direct investment relationships, which tend to take a more long-term perspective, can be motivated by a variety of factors. This is demonstrated by the annual survey of the Association of German Chambers of Commerce and Industry (DIHK) regarding its member enterprises operating in the manufacturing sector, which, as the survey shows, have exhibited great consistency in terms of their strategic objectives in recent years. In the second quarter of 2018, once again just under half of all enterprises cited the setting up or expansion of sales and customer services as their main reason for investing abroad, followed by foreign production sites in order to access markets and cost-cutting potential.¹³

¹¹ This includes reinvested earnings to the tune of €31½ billion. For information on the possible impact of reinvested earnings on savings made by domestic enterprises, see also the box on pp. 36 ff.

¹² According to the Thomson Reuters database, €74 billion were used to finance takeovers of companies domiciled abroad and previously under foreign ownership with a stake of at least 10% after the transaction. The time at which mergers and acquisitions are captured in the balance of payments can, however, differ from that recorded by Thomson Reuters, with the result that the reported figures are not directly comparable.

¹³ See DIHK, Foreign investments in manufacturing industry, spring 2018.

The relationship between domestic corporate savings and foreign direct investment, as well as the role of reinvested earnings

For years now, “Germans” have been saving more than they invest. This savings surplus is reflected in net capital exports. A sectoral analysis shows that non-financial corporations play an important role with regard to savings surpluses in Germany, although the positive net lending/net borrowing position has been declining slightly since 2016.¹ Back in 2001, the difference between savings and investment was still negative for non-financial corporations. From then until 2016, this net lending/net borrowing position rose relatively steadily. In this context, not just funding opportunities via capital markets (e.g. through the issuance of equities and bonds) were important but also the low interest rate environment. It is in this connection that the role played by foreign direct investment in corporate savings is also discussed.² This article examines the extent to which a potential relationship exists between German foreign direct investment and the net lending/net borrowing position of domestic enterprises, and the question of what factors affect domestic parent companies’ reinvested earnings with foreign affiliates. Unlike domestic fixed asset formation, investment abroad does not have a direct impact on the domestic savings-investment gap (net lending/net borrowing). However, foreign direct investment enterprises usually generate profits that are also reflected in the parent company’s profits reported in Germany, irrespective of whether they are distributed to the parent company or are retained by the affiliate.³ The part of the corporate profits that is not distributed but reinvested represents the savings generated by that company. At the same time, the retained earnings of a foreign affiliate increase direct

investment abroad. Hence, an indirect relationship may come about between foreign direct investment and the savings by the German parent company.

Yet looking at the relationship between foreign direct investment and corporate savings purely in accounting terms does not go far enough. This approach only indicates ex post that a relationship may potentially exist – but not necessarily. Since it may be assumed that international enterprises are characterised by strategic corporate planning, however, there may also be economic reasons for the idea that the (planned) corporate savings might be affected by intended foreign direct investment. For example, it is conceivable that enterprises save more specifically because they would like to engage in foreign direct investment.

This hypothesis can be assessed econometrically in a number of ways. A Bundesbank estimate with macroeconomic variables initially provides no indication of a systematic correlation between German direct investment abroad and domestic corporate savings. However, this does not rule out the possibility that such a correlation might exist at the enterprise level. On aggregate, it is possible that, at the macro level, a sys-

¹ See Deutsche Bundesbank, German balance of payments in 2017, Monthly Report, March 2018, p. 20.

² See Project Group Joint Economic Forecast, Joint Economic Forecast Autumn 2017. Upturn remains robust – amid mounting tensions, pp. 65 ff.

³ In 2018, the foreign affiliates of German enterprises generated earnings totalling an estimated €92.5 billion. Of this amount, the foreign affiliates retained €31.5 billion and distributed the remainder to the parent companies. By comparison, the savings of non-financial corporations in Germany came to €101.6 billion in 2018.

tematic correlation can no longer be observed owing to the heterogeneity of corporate decisions, a small number of observations, or other disruptive factors. At the micro level, the Bundesbank's corporate balance sheet statistics (*Unternehmensbilanzstatistik*, or Ustan) enable an estimate of individual enterprises' corporate savings. A possible and readily available measure of corporate savings is the change in the equity ratio.⁴ A methodologically more accurate alternative can also be to calculate savings in the form of retained profits.⁵ In this case, however, the information needed for the calculation is available only to a limited extent.⁶ Both measures are considered below.

The datasets on which the estimate is based are the Microdatabase Direct investment (MiDi) and Ustan. For this, the dataset from the research paper by Goldbach et al. (2019) is used.⁷ The time period covers the years 2000 to 2013. Propensity score matching is used to identify two groups of enterprises that are similar with regard to various enterprise-specific traits. There is only one major difference: whereas one group set up a new foreign affiliate in one year (group with new foreign affiliates), the other did not (control group). This method can be deployed to isolate the effect of the (new) foreign direct investment.⁸ Subsequently, a check is carried out to ascertain whether there is a significant difference in the change in the equity ratio of the two groups (as a measure of the corporate savings).

The estimation results demonstrate that the changes in the two groups are not significantly different from each other (see the above table). Alternatively, the corporate savings for the years 2007 to 2013 are calculated on the basis of the annual surpluses and distributed dividends (relative to equity). Here, too, the estimation results show no

Estimate of corporate savings at the micro level⁹

Item	Average effect of a new foreign affiliate	Observations (group of new foreign affiliates)	Observations (control group)
Δ Equity ratio _{it}	- 0.002 (0.002)	2,511	143,574
Profit for the financial year less dividend payments relative to equity capital _{it}	- 0.013 (0.315)	1,650	98,101

○ *** Significant at the 1% level, ** significant at the 5% level and * significant at the 10% level. Robust standard errors in parentheses.

Deutsche Bundesbank

significant difference. Thus, there is no indication at the enterprise level either that the establishment (or acquisition) of a foreign affiliate would entail an increase in corporate savings.

A further estimate examines which country-specific factors affect the amount of re-

⁴ The equity ratio can change, however, irrespective of the enterprise's savings. For example, the issuance of new shares increases the capital of an enterprise, but it does not constitute a saving. In addition, the equity ratio is also affected by the denominator (sum of equity and liabilities). Foreign direct investment can lead to an expansion of liabilities, thereby increasing total assets.

⁵ See J. Gruber and S. Kamin (2015), The corporate saving glut in the aftermath of the global financial crisis, International Finance Discussion Papers, No 1150.

⁶ The dividend payments are available for only some of the enterprises. Based on them, payout ratios can be determined on an annual basis which are then assumed for all enterprises. The observed measure thus varies between the individual enterprises only in terms of the annual surpluses, while the calculated share of retained earnings may also change over time.

⁷ See S. Goldbach, A.J. Nagengast, E. Steinmüller and G. Wamser (2019), The effect of investing abroad on investment at home: on the role of technology, tax savings and internal capital markets, Journal of International Economics, Vol. 166, pp. 58-73.

⁸ An expansion of existing foreign direct investment relationships is explicitly disregarded here on account of potential endogeneity problems.

Deutsche Bundesbank

invested earnings at a foreign affiliate. The reinvested earnings are measured relative to the stock of direct investment in order to take size effects into account. Information, taken from the balance of payments statistics, on dividends paid out by foreign affiliates to their domestic parent companies is linked to the balance sheet data from the MiDi database. The combined data are available for the years 1999 to 2015.

The following variables of the partner country serve as potential macroeconomic determinants: real economic growth, the nominal tax rate (tax rate), the log real gross domestic product (GDP) per capita (per capita GDP), the inflation rate (inflation), private credit relative to nominal GDP (financing conditions), the log labour force (labour), public debt relative to GDP (public debt) and the freedom/restriction of capital movements (Chinn-Ito index). In addition,

time and country fixed effects are included in the estimation.

Only the real economic growth of the partner country has a significant (positive) impact on reinvested earnings (see the adjacent table). Domestic enterprises evidently tend to expand their presence in rapidly growing economies by injecting equity capital in the form of retained earnings; the favourable economic situation in these countries puts them in a better position to do so. All other macroeconomic variables, on the other hand, have no significant impact on the reinvested earnings. It follows from this that country-specific factors, apart from a country's economic and growth prospects, have very little impact on the amount of reinvested earnings on the ground. However, this does not rule out the possibility that they affect enterprises' investment decisions on the whole.

*Most investment
destined for the
euro area*

Of the preferred target regions, the euro area was able to strengthen its position, according to the survey, as evidenced by the figures on direct investment included in the balance of payments. Together, the other member states of the euro area accounted for just under two-thirds of domestic enterprises' direct investment. Around three-quarters of German foreign investment in the euro area was focused on the financial centres of the Netherlands, Ireland and Luxembourg.¹⁴ Meanwhile, the United Kingdom lost its 2017 standing as the main destination for German direct investment among other EU countries and found itself facing capital withdrawals. As outlined above, this may be a product of the uncertainty emanating from the UK's planned Brexit. Outside Europe, the United States proved to be a major target country.

*Holding
companies
especially active*

Those German enterprises that ramped up their equity capital abroad came from various branches of industry. Constituting more than one-third of the total, providers of professional and technical services were responsible for the lion's share, with holding companies occupying a prominent position here. Just under one-third of the equity capital¹⁵ was attributable to enterprises from the area of financial and insurance services, and the same amount again was attributable to the manufacturing sector. In the case of the latter, manufacturers of pharmaceutical products, as well as of transport equipment played an instrumental role.

*Capital inflows
in the form of
intra-group
credit
transactions*

Foreign companies stepped up their provision of fresh direct investment funds to associated enterprises domiciled in Germany, channelling net inflows of €89 billion to them. This represented an increase of €15 billion compared with the previous year. As for capital inflows, intra-group lending (€76 billion) continued to dominate proceedings and, once again, the driving force in this regard came from foreign subsidiaries granting financial credits to their German parent companies. These totalled €68 billion, thus achieving a new record high. These reverse flows are often the result of capital

market business involving German enterprises' financing subsidiaries, whereby securities are issued abroad and the proceeds are forwarded to the parent companies in Germany. German groups evidently took extensive advantage of the favourable market conditions in the last year as a way of absorbing funds. Moreover, foreign owners also boosted the equity capital they provided to German branches by €13½ billion.

In terms of country of origin, euro area firms represented the largest component in 2018, at around 85%, with more than half of all direct investment inflows to Germany coming from the Netherlands. Dutch-based financial subsidiaries, in particular, provided their German parent companies with capital. In 2018, these reverse flows also played a decisive role with respect to capital inflows deriving from Ireland and the United States. Further significant capital inflows originated in Switzerland, where, first and foremost, affiliated companies granted loans to their German sister companies. By contrast, Chinese enterprises did not play an important role as investors in Germany in 2018. In previous years they had, for the most part, made investments in foreign countries other than Germany, despite having executed some high-profile acquisitions on German turf.

*Most inward
direct
investment
originated in
the Netherlands*

Other investment

Other investment, comprising financial and trade credits (where these do not constitute a part of direct investment) as well as bank deposits and other assets, resulted in net capital exports of €45½ billion in 2018, up from €27½ billion in 2017.

*Net capital
exports in other
investment*

¹⁴ The aforementioned countries are major holding locations for internationally active enterprises. As the balance of payments only captures the immediate counterparties of cross-border transactions, it is not possible to identify where the transferred funds are ultimately invested.

¹⁵ Reinvested earnings cannot be assigned to individual economic sectors and were therefore not taken into account when making this calculation. By the same token, the shares only relate to classifiable net transfers.

Other investment* broken down by sector

Balances in € billion

Deutsche Bundesbank

TARGET2 and other investment excluding TARGET2*

€ billion

* Net capital exports: +.

Deutsche Bundesbank

Capital outflows from commercial banks

A decisive role was played by outflows of funds from monetary financial institutions (MFIs) (€86 billion). On the one hand, they upped their lending to foreign counterparties, with a large portion of this taking the form of long-term financial credits to foreign enterprises and households. On the other hand, they boosted their deposits with foreign banks – primarily with group-affiliated institutions. At the same time, their cross-border liabilities contracted, not least because foreign group-affiliated institutions reduced their short-term deposits with German banks.

Bundesbank sees inflows

Contrasting with the above, the Bundesbank posted net inflows of funds in the amount of €40 billion, largely on account of a sharp increase in the Bundesbank's external liabilities (€97 billion). Here, monetary authorities and commercial banks domiciled outside the euro area, in particular, chose to boost their deposits. In the case of monetary authorities, this item includes, for example, all deposits received by the Bundesbank from non-euro area central banks as part of the range of central bank services it offers.

As for commercial banks, the APP is likely to have played a key role: Sales of securities by foreign investors to other Eurosystem central banks are often effected via Germany. This activity causes liquidity to flow to Germany, where it then partly remains, taking the form of deposits parked at the Bundesbank.¹⁶ A number of commercial banks domiciled in the European Economic Area (EEA), but not, however, in the EU, maintain an account at the Bundesbank. These accounts are included in the external position of the Bundesbank.

Rise in TARGET2 claims smaller than in 2017

On the back of the APP, the Bundesbank's TARGET2 claims vis-à-vis the European Central Bank also rose. However, at €59 billion, this increase remained well below the figure recorded in 2017 (€153 billion). This lower value is in line with a gradual reduction in the volume of securities purchases in the course of 2018.¹⁷ Last year, the Bundesbank's liabilities vis-à-vis the ECB arising from the allocation of euro banknotes within the Eurosystem went up by €42 billion. Hence, the Bundesbank's net claims vis-à-vis the ECB arising from the two balance sheet items rose only relatively moderately by €17½ billion.

¹⁶ See also Deutsche Bundesbank, TARGET2 balances – mirroring developments in financial markets, Monthly Report, December 2017, pp. 75 f.; Deutsche Bundesbank, The increase in Germany's TARGET2 claims, Monthly Report, March 2016, pp. 30 f.; Deutsche Bundesbank, The impact of Eurosystem securities purchases on the TARGET2 balances, Monthly Report, March 2016, pp. 53 ff.

¹⁷ See Deutsche Bundesbank, The German TARGET2 claims in the course of 2018, Annual Report 2018, pp. 16-17.

*Non-banks
attract net
capital imports*

Non-banks attracted modest net inflows of funds from abroad over the past year (€½ billion), reflecting the net inflows accruing to general government (€11½ billion). Above all, the latter reduced its deposits held abroad and scaled back its cross-border lending. By contrast, enterprises and households experienced outflows of funds (€11 billion). In particular, they augmented their overnight deposits held at foreign commercial banks.

Reserve assets

*Slight increase in
reserve assets*

Driven by transactions, the Bundesbank's reserve assets increased by €½ billion in 2018.

This increase was attributable to Germany's higher reserve position with the International Monetary Fund (IMF).

The international reserve holdings are also influenced by balance sheet adjustments which, in compliance with internationally agreed accounting standards, are not recognised in the balance of payments. The revaluation also generated an increase in 2018 (€6 billion), due in large part to rising gold prices and the higher valuation of the securities owing to exchange rate changes. All in all, the year 2018 saw the carrying amount of Germany's reserve assets climb by €6½ billion to €173 billion as at 31 December 2018.

■ Cash demand in the shadow economy

Cash payments are simple, secure, efficient and anonymous, which is why consumers use cash to pay for almost three-quarters of their purchases at the point of sale. At the same time, these characteristics also make cash a focal point for potential illegal uses. An oft-voiced opinion in the public debate is that cash promotes the shadow economy and is used as a means of financing crime. There are calls for regulatory measures to restrict the use of cash in view of what is presumed to be its widespread use for illegal purposes. Against this backdrop, the present article makes an empirical study of the use of cash in the shadow economy as well as in connection with related areas such as money laundering, terrorist financing and other criminal activities.

The illegal nature of such activities means that it is very difficult to provide hard research-based evidence about the scale of the cash demand resulting from the shadow economy and criminality. Empirical studies of the shadow economy are therefore subject to more than average uncertainty, meaning that all results should be interpreted with caution. It is often the case that anecdotal evidence is drawn on, taking as its direct starting point the volume of cash in circulation or the demand for large-denomination banknotes. The currency demand approach is a model framework for the empirically founded study of the scale of illicit cash usage. Our own econometric estimations adopting this approach examine whether cash lodgements made at the Bundesbank's branches and the estimated domestic demand for euro banknotes in Germany are linked to activities in the shadow economy.

However, cash is not the sole payment instrument used either in the shadow economy or to finance crime. As part of the general trend towards digitalisation, alternative payment instruments are gaining significant ground, particularly in connection with settlement via the internet or darknet.

Cash use in Germany

Reasons for and scale of cash use cannot be fully observed

The Bundesbank and the other central banks of the Eurosystem are collectively responsible for the issuance of banknotes in the euro area. At the end of 2018, the volume of euro banknotes in circulation totalled around €1,230 billion, of which approximately €690 billion was issued by the Bundesbank (see the chart below).¹ On an average of the past decade, the volume of euro banknotes in circulation increased by 4.9% per annum and therefore at a faster pace than nominal economic output in the euro area. Over the same period, the Bundesbank's cumulative net issuance increased each year by as much as 7.7% on average. Economic agents are thus demanding cash on a significant and growing scale. However, since cash can be used without documentation, there are naturally no complete statistical data available on the reasons for and scale of the use of cash as a payment instrument and a store of value.²

As a first step, the motives behind the demand for euro banknotes at the Bundesbank can be investigated by breaking them down into the components of foreign demand, domestic transaction balances and domestic hoarding.³ An estimated two-thirds of the Bundesbank's cumulative net issuance of euro banknotes were in circulation abroad at the end of 2017. According to estimates, domestic cash users were hoarding just over 20% of cumulative net issuance, while slightly less than 10% was being held as transaction balances. Studies of payment behaviour among the general public in Germany are also available.⁴ 74% of transactions at the point of sale are performed with cash, and a further 19% by debit card. In terms of turnover, cash payments account for a share of 48%, while debit card payments account for 35%. At present, therefore, cash is the most used instrument in consumers' everyday payments, but cashless payment instruments are becoming increasingly important for conducting transactions at the point of sale.

Comprehensive studies on cash use in Germany, ...

These studies do not make a distinction between the legal and illegal use of cash. However, it is vital to have information on the significance of illicit motives for cash demand, as cash demand in the shadow economy has been in the spotlight for some time. The belief that cash is being used on a large scale for illegal purposes is used for justifying regulatory

... but little information on the significance of illegal motives

¹ The volume of euro banknotes in circulation corresponds to the difference between cumulative outpayments and cumulative lodgements.
² At end-2018, the cumulative net issuance of regular-issue euro coins accounted for a mere 1.2% of the Bundesbank's total cumulative net issuance of euro banknotes and regular-issue euro coins, meaning that statements relating to banknote demand are also likely to be valid for the demand for euro banknotes and coins as a whole.
³ See Deutsche Bundesbank, The demand for euro banknotes at the Bundesbank, Monthly Report, March 2018, pp. 37-51, and N. Bartzsch and M. Uhl, Domestic and foreign demand for euro banknotes issued in Germany, in Deutsche Bundesbank (ed., 2017), International Cash Conference 2017 – War on cash – is there a future for cash?, pp. 250-287.
⁴ See Deutsche Bundesbank (2018), Payment behaviour in Germany in 2017 – fourth study of the utilisation of cash and cashless payment instruments.

Shadow economy activities		
Activities	Monetary transactions	Non-monetary transactions
Legal activities	Not declaring income from the production or sale of legal goods (e.g. car repairs, services of skilled tradespeople, household services, VAT fraud in restaurants and catering or in trade)	DIY work; odd jobs for neighbours
Illegal activities	Producing, smuggling or selling drugs; trading in stolen goods	Producing or smuggling drugs for personal use

Deutsche Bundesbank

measures to restrict the use of cash.⁵ One concrete policy measure restricting the use of cash consists in ceilings for cash payments, which have been introduced in a number of European countries to combat the shadow economy, money laundering and terrorist financing (see the box on p. 46). Against this backdrop, this article examines the illegal use of cash.⁶

Illegal use of payment instruments

Shadow economy

"Shadow economy" refers to covert economic activities

Illegal uses of payment instruments refer to those uses where the surrounding circumstances are not consistent with established law. This includes the use of cash in what is known as the shadow economy. According to one common definition, the shadow economy encompasses the production of goods and services that is concealed from the authorities in order to avoid financial or other burdens.⁷ The table above shows examples of activities in the shadow economy. Here, the differing forms taken by the shadow economy are distinguished along two dimensions: the legal status of an activity, which is either legal when taken in isolation or already illegal in itself, and the kind of consideration received, which may, for

example, be a monetary transaction in cash or a non-monetary transaction (e.g. helping neighbours).

Activities in the shadow economy are carried out covertly and are thus, at least partly, not captured in the official statistics. Various estimation methods are used in the literature to determine the size of the shadow economy.⁸ The table on p. 47 provides an overview of estimates of the size of the shadow economy in

Size of the shadow economy

⁵ See P. Bofinger (2015), Bargeld ist ein Anachronismus, in Der Spiegel, 21, p. 56, K. Rogoff (2016), The curse of cash, Princeton University Press, and P. Sands (2016), Making it harder for the bad guys: The case for eliminating high denomination notes, M-RCBG Associate Working Paper 52.

⁶ Our own empirical analyses were conducted in collaboration with Professor Friedrich Schneider of the Johannes Kepler University Linz.

⁷ There is no standard definition of the shadow economy. For the concept of the shadow economy, see F. Schneider and D. Enste (2000), Shadow economies: Size, causes, and consequences, Journal of Economic Literature, 38(1), pp. 77-114, and F. Schneider (2015), Schattenwirtschaft und Schattenarbeitsmarkt: Die Entwicklungen der vergangenen 20 Jahre, Perspektiven der Wirtschaftspolitik, 16(1), pp. 3-25.

⁸ See F. Schneider and D. Enste (2000), op. cit., and F. Schneider (2015), op. cit. Some of the methods used have been hotly debated in the economic literature, see J. Thomas (1999), Quantifying the black economy: "Measurement without theory" yet again?, Economic Journal, 109(456), pp. 381-389, F. Schneider (2015), op. cit., E. Feige (2016), Reflections on the meaning and measurement of unobserved economies: What do we really know about the "shadow economy"?, Journal of Tax Administration, 2(1), pp. 5-41, and G. Kirchgässner (2017), On estimating the size of the shadow economy, German Economic Review, 18(1), pp. 99-111.

Ceilings for cash payments

Cash payment ceilings are restrictions which limit the amounts that can be paid in cash; above these threshold values it is no longer permissible to conduct transactions in cash, and cashless payment instruments have to be used instead. As cashless payment instruments are more easily traceable, ceilings for cash payments are designed to help in combating tax evasion in the shadow economy, money laundering and the financing of terrorism.¹

So far, 12 EU Member States have introduced national restrictions on cash payments which differ, above all, in the amount of the threshold value. The ceilings range at present from €500 in Greece to the equivalent of around €15,000 in Poland and Croatia. However, the categories of persons as well as the sectors affected by the restrictions differ from country to country. At present, they chiefly affect transactions between businesses or transactions between businesses and private individuals. No EU Member State imposes restrictions on the possession of cash. Moreover, in some Member States differing restrictions for residents and non-residents apply. For (tax) residents in France, for example, there has been a cash payment ceiling of €1,000 in force since 2015 (previously €3,000); non-residents, on the other hand, can conduct cash transactions up to €15,000.

The European Commission recently looked into the introduction of an EU-wide standard ceiling for cash payments with the aim of combating the financing of terrorism. The European Commission came to the conclusion that EU-wide cash payment ceilings would not, at present, suitably address the problem of terrorist financing and, in June 2018, announced that any plans for an EU-wide restriction on cash payments were not going to be taken any further at the

present time.² It based its decision on two public consultations it conducted/commissioned³ which also involved affected professional groups and institutions.⁴ At just under 95% of those surveyed, a broad majority of the general public came out against an EU restriction on cash payments.⁵ Doubts about its effectiveness were among the arguments cited by the participants in the survey. All things considered, the European Commission came to the conclusion that ceilings on cash payments will not, as a rule, deter criminals from committing a criminal act, especially in the case of offences in connection with tax evasion or terrorist financing.⁶

When assessing restrictions on cash payments in terms of combating criminal activity, consideration should be given not only to their effectiveness but also to other aspects.⁷ For instance, the introduction of a ceiling for cash payments represents an encroachment on consumers' freedom to choose the method of payment and risks a possible loss of confidence in the currency on the part of the general public.

¹ Restrictions on the use of cash are also considered in Deutsche Bundesbank, Policy options for cash payments, Annual Report 2015, pp. 36-38.

² See European Commission (2018), Report from the Commission to the European Parliament and the Council on restrictions on payments in cash.

³ See European Commission (2017), Outcome of the open public consultation on potential restrictions on large payments in cash.

⁴ See Ecorys (2017), Study on an EU initiative for a restriction on payments in cash, Final Report.

⁵ This was a self-selected survey and not a representative sample. Of the respondents, 92% came from Austria, France or Germany.

⁶ See European Commission (2018), op. cit.

⁷ Up to now, very few data have been available for an empirical analysis of the effectiveness of cash payment ceilings. International comparisons are also made more difficult by the fact that cash payment limits have been introduced, in particular, by countries with a large shadow economy.

Size of the shadow economy in Germany*

Deutsche Bundesbank

Germany. The studies are based on different definitions of the shadow economy, which means that the results they produce are not always directly comparable. Across the various studies, these estimates show the size of the shadow economy ranging between 2.4% and 16.6% of gross domestic product (GDP) in Germany. Relative to a GDP of around €3,300 billion in 2017, all other things being equal, these estimates reveal the size of the shadow economy to be between approximately €80 billion and €550 billion. The considerable range of estimation results thus far reflects their sensitivity to the chosen method of calculation. Overall, estimates based on public surveys⁹ are significantly lower than macroeconomic estimates using, say, the currency demand approach¹⁰ or structural equation modelling.¹¹ The size of the shadow economy is possibly underestimated in studies based on public surveys, as respondents may be unwilling to disclose information. A widely-held opinion in the literature, on the other hand, is that macroeconomic procedures could overestimate the size of the shadow economy.¹² One reason for this, for instance, is that some analyses do not take into account foreign demand or the function of cash as a legal store of value.

Cash facilitates simple, secure, quick and anonymous payments, which also makes it a con-

venient payment instrument for clandestine economic activities. The exchange of goods plays a role in the shadow economy, too, however. When producing fake invoices as a smokescreen for illicit work, a combination of cash and cashless payments is used.¹³ Alongside illegal labour, the non-disclosure of income from goods trading represents a further form of shadow economy activity. In this context, income is likely to be predominantly in the form of cash if stationary points of sale or invoices

are manipulated in order to evade taxes. Such illegal goods trading could become increasingly internet-based given the general trend towards digitalisation, meaning that these transactions would be settled without cash. VAT fraud in online trading supports this view.¹⁴ The fact that the level of online drug trafficking recorded by the police in Germany in 2017 showed a 24% increase on the year and accounted for as much as 5% of all recorded offences in this area is a further sign of increasing digitalisation in the shadow economy.¹⁵ Payments in the shadow economy can also be made via the official banking system – for example, in cases where anonymity is created through the use of letterbox companies. This seems to happen often in carousel transactions involving the transfer of apparently legal money flows and input tax refunds. Alongside cash, cashless forms of settlement also play a role in the shadow economy.

Other potential illegal uses of payment instruments

Other areas of crime should also be studied for a holistic analysis of the illegal use of payment instruments

Further unlawful uses of payment instruments occur, for example, in connection with undeclared income from capital (e.g. dividends, interest),¹⁶ property crime (e.g. theft of payment instruments), various forms of white-collar crime (e.g. financing, insolvency, labour, competition and contribution-related offences), and corruption or cybercrime (e.g. phishing in online banking). Another term which is often discussed in connection with criminal activities is “money laundering”. This refers to illegally acquired assets – such as illicit earnings from criminal activities – being channelled into the legal financial and economic cycles.¹⁷ In addition, the rise of Islamist terrorist groups has thrust the financing of terrorism further into the spotlight.¹⁸ Owing to the sparse availability of data, however, empirically reliable statements on the scale of these other illegal areas can be made only to a very limited extent, if at all.

In some of the areas mentioned, cash plays only a partial role or is not used at all. In cases of unreported income from capital, for example, illegal money frequently appears to be channelled into countries which constitute an attractive destination on account of comparatively low rates of taxation, a high level of confidentiality and secrecy and/or less-developed financial market supervision/regulation. It is estimated that 8% of the financial wealth of households worldwide, totalling US \$7.6 trillion, is held in such tax havens.¹⁹ Corruption represents another illegal use of payment instruments. 70% of all corruption cases recorded by police in 2017 were committed using cash.²⁰ Non-cash benefits or other monetary assets accounted for just under 7% each. Cash therefore plays a significant role, although the use of cash is subject to major fluctuations over

Other payment instruments used alongside cash

¹⁵ See Federal Criminal Police Office (2018), Bundeslagebild Rauschgiftkriminalität 2017.

¹⁶ Besides illicit work, illegal trading of goods and undeclared income from capital, other forms of tax fraud or evasion are conceivable – for instance, income from the assignment of intangible assets, such as licences or rights. The evasion of other forms of tax, such as corporation tax or local business tax, is also possible, alongside the aforementioned evasion of income tax and VAT.

¹⁷ See J. Walker (1999), How big is global money laundering?, *Journal of Money Laundering Control*, 3(1), pp. 25-37, E. Dreer, W. Riegler and F. Schneider (2006), *Geldwäsche: Formen, Akteure, Größenordnung – und warum die Politik machtlos ist*, Gabler, and J. Walker and B. Unger (2009), *Measuring global money laundering: “The Walker gravity model”*, *Review of Law and Economics*, 5(2), pp. 821-853.

¹⁸ Even though the sum total of terrorist financing is, by its very nature, unknown both on a global scale and in terms of Germany alone, a conceptual distinction needs to be made between the financing of individual terrorist attacks and that of entire terrorist groups. Significant sums primarily arise in the case of the latter. The planning and implementation costs of the most recent terrorist attacks in Europe are estimated to have been somewhere between less than €2,000 and €82,000. See Ecorys (2017), *Study on an EU initiative for a restriction on payments in cash*, Final Report.

²⁰ See Federal Criminal Police Office (2018), *Bundeslagebild Korruption 2017*.

time (2016: 35%, 2015: 77%).²¹ In the context of terrorist activities, cash generally seems to be used for payments or smuggling.²² However, the formal financial system may also play an important role, such as when it comes to making credit transfers or taking out loans. The use of prepaid cards is often observed, too.²³ Added to these are informal banking systems (such as hawala) and crypto-tokens.

money – also used for criminal purposes. However, as a result of the clandestine nature of illegal activities, the precise extent of this can only be estimated and is subject to an above-average degree of uncertainty.

Difficult to determine the extent of illegal cash use

Estimates of illegal cash holdings based on volume of cash in circulation

It is often argued that the overall volume of cash in circulation as well as the demand for large-denomination banknotes are greater than might be expected if cash were used solely for legal purposes. Conversely, this would suggest that the illegal use of cash is a widespread phenomenon. To illustrate this argument, the table on p. 50 shows cash in circulation per inhabitant as well as the percentage of large-denomination banknotes in circulation for a range of currency areas. The demand for euro banknotes by denomination is shown in greater detail in the chart on p. 50.

Estimates based on volume of cash in circulation are widespread

For a large number of currency areas, the figures for cash in circulation per inhabitant cannot be explained by the information available for each currency on the foreign demand or on

Holistic analysis of payment transactions appropriate

The impression that it is mainly or even exclusively cash that is used for criminal purposes – and that, as a consequence, cash is typically used at the start of the money laundering process to infiltrate the financial system – therefore has to be modified to account for all aspects. First, money laundering comprises not only cash-driven activities in the shadow economy, but also, for instance, the repatriation of assets resulting from the evasion of tax on capital income or from cybercrime. Second, to undertake shadow economy activities, electronic payment processes are increasingly coming into question as described above, especially for settlement over the internet or darknet. In general, it seems that money laundering methods are also becoming more digital, for instance through the use of cryptocurrencies or “offshore instruments”.²⁴ Since bank accounts serve as an interface between cash and cashless payments and offer the possibility of converting cash into book money by making a deposit, or converting book money into cash by making a withdrawal, it is likely that, in many cases, illegal money will change its form multiple times during the money laundering process. When evaluating the role of various payment instruments in the money laundering process, it therefore seems appropriate to take an all-encompassing view of payment transactions.

Extent of illegal use of cash in Germany

Based on these considerations, cash is – alongside other means of payment and forms of

²¹ See Federal Criminal Police Office (2017), Bundeslagebild Korruption 2016.

²² Many of the transactions are low-value and thus differ only slightly, if at all, from ordinary transactions. As a result, they attract little attention ahead of terrorist attacks, irrespective of the payment instrument used. See E. Oftedal (2014), The financing of jihadi terrorist cells in Europe, Norwegian Defence Research Establishment, and H. Mai (2016), Cash, freedom and crime: Use and impact of cash in a world going digital, Deutsche Bank Research.

²³ See U. Dalinghaus (2017), Keeping cash: Assessing the arguments about cash and crime, International Currency Association.

²⁴ The role of cryptocurrencies is discussed in U. Dalinghaus (2017), op. cit., and Ciphertrace (2018), Cryptocurrency anti-money laundering report 2018 Q2. In many methods of money laundering, it appears that interactions with non-residents play a key role. For example, particularly by using “brass-plate companies”, illegal money is often shifted back and forth between different countries before coming back into the possession of its true owner; for more information, see also H. Merten (2017), Verteilung aus dem Paradies: 100 Jahre Steueroasen zwischen Nummernkonten, Briefkastenfirmen und Karibikinseln, FBV.

Cash in circulation per inhabitant and percentage of large-denomination banknotes*

Country/ country group	Cash per capita in US dollar	Percentage of large- denomination banknotes	Lowest-value large- denomination banknote

cash holdings for transaction purposes.²⁵ By way of an example, subtracting the estimated foreign demand from the value of Bundesbank-issued euro banknotes gives a domestic demand of around €200 billion, or €2,500 per inhabitant, at the end of 2016. The available figures on credit institutions' cash holdings (€26 billion), households' estimated cash holdings for transaction purposes (€13 billion),²⁶ and retailers' estimated cash holdings (€2 billion) only partially account for this volume of cash in circulation.²⁷ The remaining unexplained cash holdings could be held both as a legal store of value as well as for illegal purposes.²⁸ Without knowledge of the stock of cash held legally as a store of value, it is impossible to draw any conclusions about illegal cash holdings in this way.²⁹

Not directly possible to separate the demand for cash into legal and illegal holdings

²⁵ See K. Rogoff (1998), Blessing or curse? Foreign and underground demand for euro notes, *Economic Policy*, 13(26), pp. 263-303, K. Rogoff, Costs and benefits to phasing out paper currency, in J. Parker and M. Woodford (eds., 2015), *NBER Macroeconomics Annual 2014*, 29(1), pp. 445-456, and K. Rogoff (2016), op. cit.

²⁶ This estimate of households' cash holdings for transaction purposes can, in part, even comprise illegal uses of cash as it is based on responses to the Bundesbank's payment behaviour study regarding the cash withdrawals; see Deutsche Bundesbank, *The demand for euro banknotes at the Bundesbank*, op. cit. This provision of cash could partially serve illegal purposes.

²⁷ See Deutsche Bundesbank, *The demand for euro banknotes at the Bundesbank*, op. cit.

²⁸ Economic agents could hold a part of their assets in cash, probably for reasons of liquidity and security; see Deutsche Bundesbank, *Cash as a means of payment and a store of value*, Annual Report 2015, pp. 25-45. Some consumers could form cash reserves in order to cover expenses even in the event of unforeseen circumstances. Certain investors could doubt the stability of the banking and financial system and set aside cash for this reason. Cash is secure central bank money and is therefore fundamentally immune to any default risk. One example of the fact that cash is held legally as a store of value on a substantial scale can be seen from developments in the demand for cash during the escalation of the financial crisis following the Lehman Brothers crisis in September 2008. October 2008 saw an immense increase in the Bundesbank's net outpayments of €500 banknotes, which totalled €11.4 billion in that month. By comparison, cumulative net outpayments of that denomination in 2008 as a whole, excluding the month of October, amounted to €10.3 billion. See Deutsche Bundesbank, *Demand for banknotes during the financial crisis*, Monthly Report, June 2009, pp. 52-53.

²⁹ In addition, estimates of illegal cash holdings as a residual are unlikely to be very robust, as estimation errors in the other components have a knock-on effect on the estimated scale of illegal cash holdings.

On the basis of demand for large-denomination banknotes, it is also not possible to draw any direct conclusion about the use of cash in the shadow economy

The table and chart on p. 50 suggest that large-denomination banknotes comprise a significant part of cash in circulation in the euro area as well as in other currency areas. However, the demand for large denominations alone cannot be used to support the conclusion that cash is being used for illegal purposes, since these denominations are equally suitable as a legal store of value or for legal and illegal high-value payments. In particular, interpreting the Bundesbank's cumulative net issuance is made more difficult by the fact that the banknotes that it issues also circulate abroad. In summary, anecdotal evidence drawn from the volume of cash in circulation or the demand for large-denomination banknotes is not appropriate for quantifying illegal cash holdings.

Cash-deposit ratio approach not satisfactory either

One variant of the estimates that use the volume of cash in circulation as a starting point looks at what is known as the "cash-deposit ratio", which is usually defined as the ratio of cash in circulation to sight deposits. This approach assumes that, excluding the impact of the shadow economy, cash is held in constant proportion to sight deposits. Unexplained rises in this cash-deposit ratio – compared with a "natural" cash-deposit ratio defined using a given base year – are interpreted as pointing to an illegal holding of cash.³⁰ When applying this approach, choosing a base year is a particular challenge. Additional problems arise because a range of determinants – such as the interest rate, the level of economic output as well as innovations in payments and banking – can, over time, change the ratio of cash in circulation to sight deposits.³¹ Specific examples of relevant determinants are an increasing volume of cashless wage payments as well as the emergence of ATMs.³² The cash-deposit ratio could, in principle, also rise following an increase in legal use of cash as a store of value. The chart above shows that variously defined cash-deposit ratios have been tending to decline in Germany over the past few decades. As a result, unexplained rises in the cash-deposit ratio, too, cannot be used to draw any conclusions regarding the use of cash in the shadow econ-

omy.³³ At least without adjustments, the cash-deposit ratio is therefore also unlikely to offer a suitable method for estimating the illegal cash demand.

³⁰ The cash-deposit ratio approach dates back to P. Cagan and P. Gutman, see P. Cagan (1958), The demand for currency relative to the total money supply, *Journal of Political Economy*, 66(4), pp. 303-328, and P. Gutmann (1977), The subterranean economy, *Financial Analysts Journal*, 33(6), pp. 26-34.

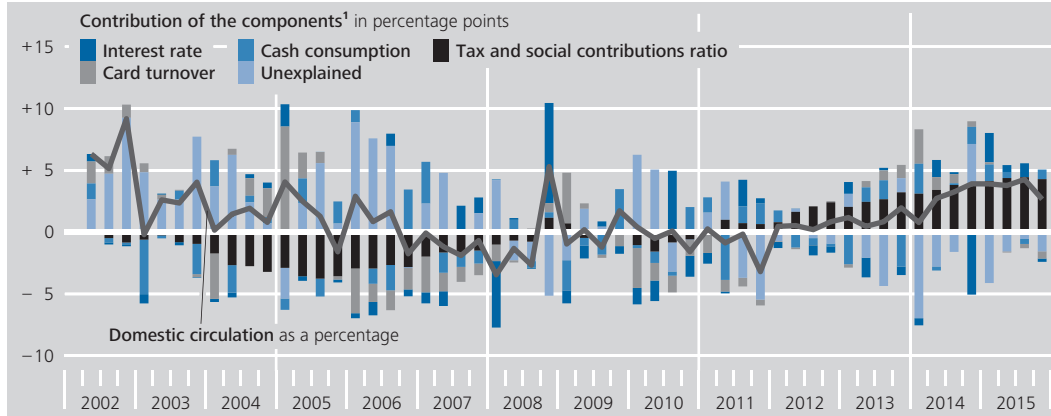

³¹ See P. Cagan (1958), op. cit.

³² The factors cited above are also likely to influence the development of the ratio of cash in circulation to GDP; see Deutsche Bundesbank, *Circulation of the Deutsche Mark – from currency reform to European monetary union*, Monthly Report, March 2002, pp. 19-34.

³³ See M. Pickhardt and J. Sardà (2011), The size of the underground economy in Germany: A correction of the record and new evidence from the modified-cash-deposit ratio approach, *European Journal of Law and Economics*, 32(1), pp. 143-163.

Composition of growth in the domestic demand for banknotes*

Quarter-on-quarter change, seasonally adjusted

* Based on the estimation of the static long-run equation for the regression model of the domestic demand for banknotes. ¹ The components were adjusted by their mean values during decomposition.
 Deutsche Bundesbank

Estimates using the currency demand approach

Econometric modelling of the demand for cash more promising

An alternative to these direct approaches is provided by economic research into the shadow economy in the form of the “currency demand approach”.³⁴ The currency demand approach for analysing the shadow economy enhances traditional money demand models³⁵ by the addition of variables that are designed to capture the impact of illegal activities on the demand for cash. Since it is not possible to observe the scale of the shadow economy and other unlawful forms of behaviour, indicators that should be connected with the illegal activities under consideration are included as proxies. In the literature, a tax rate is usually incorporated into the currency demand model because the burden of taxation and social contributions is considered to be a key motive for production in the shadow economy.³⁶ Other variables, such as the rate of unemployment and indicators of criminality, can also be included in empirical modelling.³⁷ Provided that the selected indicators explain parts of the currency demand, this ultimately points to an illegal use of cash.

Currency demand approach widely used

Studies for Germany based on the currency demand approach do, in fact, find that measures for the tax burden have a statistically significant

influence on the demand for cash.³⁸ This is one indication that the shadow economy has an impact on currency demand in Germany. One application quantifies the extent of the shadow economy in Germany at 15% of GDP (see the table on p. 47). One criticism levelled at the currency demand approach is that the derived results are crucially dependent on key assumptions.³⁹ Specifically, the legal function of cash

Panel analysis of cash lodgements at Bundesbank branches

The motives behind cash use in Germany are investigated by analysing lodgements made at Bundesbank branches. In simplified terms, the central bank issues banknotes to the commercial banks which, in turn, pay them out to their customers. Consumers use the banknotes to make purchases from retailers, who then deposit the cash at the central bank, either directly or via the commercial banks.¹ On balance, while banknotes are also put back into circulation by commercial banks after undergoing checks for authenticity and fitness, it is the Bundesbank which carries out the lion's share of automated banknote processing in Germany. Cash deposits at the Bundesbank's branches thus provide a coherent picture of cash usage in Germany. Here, we examine whether these inpayments are, in part, attributable to the shadow economy. Cash is paid in at the Bundesbank by retailers and banks and therefore stems from legal transactions, in principle. However, it is possible that cash deposits could be indirectly linked to income from the shadow economy without the Bundesbank being able to tell whether a specific lodgement involves cash that has previously been used in a shadow economy transaction.

It is assumed that real cash deposits per inhabitant in region i at time t , Inp_{it} , result from economic output, $GDP_{it}(1+x'_{it}\beta)$, weighted with a share of cash payments η_{it} . This economic output is made up of the real gross domestic product (GDP) per inhabitant, GDP_{it} , plus the shadow economy. To approximate the size of the shadow economy we factor in variables x_{it} , for which a relationship with the size of the shadow economy can be assumed. The scale of the shadow economy in relation to the measured economic output GDP_{it} is denoted by

$x'_{it}\beta$, where β is a coefficient vector. The equation below illustrates the relationship being described.

$$Inp_{it} = \eta_{it}GDP_{it}(1 + x'_{it}\beta),$$

$$i = 1, \dots, N, t = 1, \dots, T$$

By making use of the approximations $\eta_{it} \approx e^{\alpha_i}e^{\lambda_t}$ and $\log(1+x'_{it}\beta) \approx x'_{it}\beta$, after taking logarithms and the addition of an error term u_{it} , the estimating equation shown below is obtained.

$$\log(Inp_{it}) = \alpha_i + \lambda_t + \log(GDP_{it}) + x'_{it}\beta + u_{it}, \quad i = 1, \dots, N, t = 1, \dots, T$$

This equation represents a static panel regression with fixed effects for regions (α_i) and time periods (λ_t). Panel data for cash deposits broken down by region for the years 1993 to 2015 are used for the empirical investigation. The least squares method is applied to determine the model parameters.²

Several variables are taken into account as indicators for the shadow economy x_{it} so as to yield as complete a picture as possible of

¹ For a description of the banknote cycle in Germany see Deutsche Bundesbank, The banknote cycle and banknote recycling in Germany, Monthly Report, January 2011, pp. 17-27. When it comes to the coin cycle, the Bundesbank's role is limited to that of a wholesaler.

² We use panel-corrected standard errors which are robust to panel heteroscedasticity and contemporaneous correlation between panels. See N. Beck and J. Katz (1995), What to do (and not to do) with time-series cross-section data, *American Political Science Review*, 89(3), pp. 634-647. To adjust for autocorrelation of the residuals the variables are first transformed using the Prais-Winsten approach; see R. Parks (1967), Efficient estimation of a system of regression equations when disturbances are both serially and contemporaneously correlated, *Journal of the American Statistical Association*, 62(318), pp. 500-509; J. Kmenta (1997), *Elements of econometrics*, 2nd edition, University of Michigan Press.

Cash deposits indirectly attributable to illegal cash transactions as a percentage of total cash deposits	12.2	3.9	13.9

* Looking at a panel of regions for the period 1993 to 2015. The columns of the table show the results from different model specifications in which the selected indicators are first included individually and then collectively. In each case, the dependent variable is log real cash inpayment per inhabitant. *** significant at 1%, ** significant at 5%, * significant at 10%. The coefficient of determination is calculated as the squared correlation between the dependent variable and the values predicted by the model. t-values in brackets.

Deutsche Bundesbank

the influence of the shadow economy on cash lodgements. The burden of taxation and social security contributions is regarded as an important motive for shifting economic activities to the shadow economy. The tax and social contributions ratio is therefore a possible indicator for illegal uses of cash.³ Other indicators include the unemployment rate, the self-employment rate and the proportions of people employed in the agricultural sector and the construction sector.⁴ We also want to cover areas of the shadow economy where the manufacture or trading of the produced goods is illegal. To this end, we investigate the influence of indicators of regional crime levels taken from the police crime statistics.⁵ The variables considered are the total number of criminal offences per 1,000 inhabitants, the number of crimes involving brutality and offences against personal freedom per 1,000 inhabitants,⁶ the number of offences involving theft per 1,000 inhabitants and the

number of drug-related offences per 1,000 inhabitants. The adjacent table shows selected results from the panel econometric analyses. Only the results for the indicators of illegal cash use that exhibit a statistically significant impact with the expected sign are included.

A common approach in the literature is to ascertain the quantitative extent of illegal cash usage using a model simulation on the basis of the estimated model equations.⁷ The value for the dependent variable projected by the model is usually calculated first. This calculation is then repeated under the assumption that the shadow economy indicators take a certain reference value in order to work out what the value of the dependent variable would be without the shadow economy. The difference between these values gives an estimate for the degree to which the dependent variable under consideration (for example, cash in circulation or cash lodgements) is attributable to

³ See L. Feld and F. Schneider (2010), Survey on the shadow economy and undeclared earnings in OECD countries, *German Economic Review*, 11(2), pp. 109–149. This indicator is chosen, for example, in V. Tanzi (1983), *The underground economy in the United States: Annual estimates, 1930–80*, *International Monetary Fund Staff Papers*, 30(2), pp. 283–305, and F. Schneider (1986), *Estimating the size of the Danish shadow economy using the currency demand approach: An attempt*, *Scandinavian Journal of Economics*, 88(4), pp. 643–668.

Turati (2014), *Money laundering as a crime in the financial sector: A new approach to quantitative assessment, with an application to Italy*, *Journal of Money, Credit and Banking*, 46(8), pp. 1555–1590; H. Herwartz, J. Sardà and B. Theilen (2016), *Money demand and the shadow economy: Empirical evidence from OECD countries*, *Empirical Economics*, 50(4), pp. 1627–1645.

⁵ See Federal Criminal Police Office, *Police Crime Statistics – Federal Republic of Germany*, Report 2015.

⁶ This covers, for example, offences involving robbery or bodily injury; see Federal Criminal Police Office, *op. cit.*

⁷ See V. Tanzi (1983), *op. cit.*; F. Schneider (1986), *op. cit.*; G. Ardizzi, C. Petraglia, M. Piacenza, F. Schneider and G. Turati (2014), *op. cit.*

the shadow economy. The calculated values for the extent of illegal cash use may depend heavily on the assumptions made and should be interpreted with caution accordingly. For instance, setting a reference value for the shadow economy indicators when there is assumed to be no shadow economy is an arbitrary exercise to a certain extent. Despite these limitations, in the interests of transparent documentation of the possible model implications, the table on p. 54 shows the results of a model simulation following the pattern detailed above for the average share of cash deposits that can be indirectly attributed to the shadow economy.⁸ On balance, averaged across the regions and time periods included in the study, around 14% of lodgements can be indirectly ascribed to the shadow economy. After conversion, we end up with deposits of illegal cash totalling around €60 billion for the year 2015. Conceptually speaking, it

is not possible to determine the size of the shadow economy on the basis of this value. One reason for this is that we do not know how frequently cash is used for transactions within the shadow economy before it makes its way into the formal economy. This estimate for the volume of illegal cash lodgements would be consistent with high estimates for the size of the shadow economy if cash takings in the shadow economy were primarily and repeatedly reused for payments in the shadow economy before being deposited at the Bundesbank via retailers or credit institutions.

⁸ The calculation is based on a method used in the economic literature; see V. Tanzi (1983), *op. cit.* The reference value for the shadow economy indicators for which there are only legal cash lodgements is set at zero.

as a store of value as well as foreign demand should also be captured in the currency demand approach. When interpreting the results, due account should also be taken of the fact that the currency demand approach can only investigate the illegal uses of cash that are sufficiently large in scale to be relevant to a national economy and for which suitable indicator variables are available.

The significance of illegal motives for the use of cash in Germany is the subject of two new studies based on the currency demand approach. A panel econometric analysis looks at the impact of the illegal use of cash on cash lodgements at branches of the Bundesbank. Using a time series econometric regression analysis, the significance of illegal motives for the domestic demand for banknotes is investigated. Of the nine indicators of illegal cash use considered in the panel econometric analysis (see the box on pp. 53 ff.), only the coefficients of the self-employment rate and the number of

drug-related offences are statistically significantly different from zero with the expected sign.⁴⁰ Given a 1 percentage point rise in the self-employment rate or one additional drug-related offence per 1,000 inhabitants, cash lodgements would, depending on the specification, go up by 4% to 5% and thus also on an economically significant scale. The box on pp. 53 ff. discusses the extent to which quantitative estimates of the volume of cash lodgements stemming indirectly from the shadow economy are reliably possible and what results are achieved by doing this.

In addition, the use of cash in the shadow economy is estimated using regression analyses

⁴⁰ The statistical significance of a regression coefficient means that sample data deviate so strongly from the assumption that the coefficient is equal to zero (null hypothesis) that this hypothesis is rejected in accordance with a predefined rule (significance test). The significance test, however, does not provide any information on the strength of the effect, i.e. the economic significance of the regression coefficient.

Two new studies on the significance of illegal motives for cash demand

Estimating the domestic demand for banknotes

The contribution of various determinants to the domestic demand for banknotes can be captured in econometric models. For this purpose, the Bundesbank has estimated dynamic regression models; more specifically, autoregressive distributed lag (ARDL) models.¹ The estimates are made using a real specification and with seasonally adjusted data covering the period from the first quarter of 2002 to the fourth quarter of 2015 (and, for some variables, to the second quarter of 2016). The price-adjusted domestic demand for banknotes to be explained is the real difference between total cumulative net issuance of banknotes by the Bundesbank and estimated foreign demand.² This analysis focuses on the shadow economy as an explanatory variable for banknote demand. An increase in shadow economy activities should result in a higher demand for cash. The phenomenon of the shadow economy has a variety of manifestations that can be modelled using the following proxy variables: tax and social contributions ratio, employment rate in the agricultural sector, employment rate in the construction sector, unemployment rate, self-employment rate, drug-related crimes, and crimes in total. These variables represent various aspects of the shadow economy. The first five of these proxy variables can be assigned to legal production and are designated here as the “shadow economy – legal production” group. The last two proxy variables represent illegal activities and form the “shadow economy – illegal” group. To avoid the problem of omitted variables, two proxy variables for the shadow economy were included as regressors in the starting specification of the estimated models; one from the “shadow economy – legal production” group and one from the “shadow economy – illegal” group.³

The traditional determinants of the demand for cash are modelled by cash consumption as a transaction variable and interest rate as an opportunity cost variable. Cash consumption refers to those categories of private consumption that are largely settled in cash.⁴ The entire interest rate range is incorporated into the analysis by including a shift parameter from an estimated yield curve to represent the generally prevailing interest rate level. Domestic card turnover is used as a control variable for the substitution of cash with cashless payment instruments. The impact of card payments on the demand for banknotes is theoretically uncertain. Girocards and credit cards are a substitute for cash payments, although they are also used to withdraw cash from ATMs. The impact on demand is twofold: on the one hand, lower transaction costs for withdrawing cash reduce the demand for cash. On the other hand, however, they also make it easier to access cash, thus boosting demand.

The model’s starting specification is as follows:

$$\begin{aligned}
 y_t = & c + \alpha_1 y_{t-1} + \alpha_2 y_{t-2} + \alpha_3 y_{t-3} \\
 & + \alpha_4 y_{t-4} + x'_t \beta_1 + x'_{t-1} \beta_2 \\
 & + \gamma_1 z_{prod,t} + \gamma_2 z_{prod,t-1} + \gamma_3 z_{illegal,t} \\
 & + \gamma_4 z_{illegal,t-1} + u_t, \quad t = 1, \dots, T
 \end{aligned}$$

¹ No cointegration relationships could be identified.

² See Deutsche Bundesbank, The demand for euro banknotes at the Bundesbank, Monthly Report, March 2018, pp. 37-51.

³ Due to the relatively low number of observations, it was decided not to include all seven proxy variables for the shadow economy in the regression equation at the same time.

⁴ These include spending on accommodation and hospitality services, clothing and footwear, leisure, entertainment and culture, food, beverages and tobacco as well as on other purposes, such as healthcare.

where y_t stands for the domestic demand for banknotes as an endogenous variable, c is the constant term, x_t designates the vector of the control variables, $z_{prod,t}$ represents a shadow economy variable from the “shadow economy – legal production” group, $z_{illegal,t}$ represents a shadow economy variable from the “shadow economy – illegal” group, and u_t is the residual. The alphas, betas and gammas are the corresponding coefficients. The final specification of this model was determined using a general-to-specific approach. The most meaningful model in economic terms was selected from the resulting models. This is shown in the adjacent table. With the exception of the tax and social contributions ratio, which is already stationary according to statistical tests, all variables are transformed into stationary variables before being fed into the analysis. The first difference of the interest rate is used for this variable. The remaining variables are transformed using their first logarithmic difference. The test statistics do not point to a misspecification of the regression model. The dynamic regression model explains domestic demand using its lagged values, cash consumption in the previous period, the interest rate, card turnover lagged by one period as well as the tax and social contributions ratio as a proxy variable for the shadow economy. Furthermore, a dummy variable depicts the increase in the demand for banknotes in the wake of the 2008 financial crisis.⁵ All estimated coefficients have the theoretically expected signs and are statistically significant; for card turnover, the negative effects on domestic demand predominate. To interpret the results, it is essential to identify the long-term effects on domestic demand caused by permanent changes in the explanatory variables. In order to extract these long-term multipliers, the dynamic regression model in reduced form is transposed into the static long-run equation.

Regression estimation for domestic demand^o

Deutsche Bundesbank

The long-term multiplier for the tax and social contributions ratio suggests that an increase of 1 percentage point in this ratio pushes up the growth rate of domestic demand by 2.2 percentage points.

⁵ See Deutsche Bundesbank, Demand for banknotes during the financial crisis, Monthly Report, June 2009, pp. 52-53.

Statistical regression of domestic demand for banknotes on proxy variables for the shadow economy

of the (real) domestic demand for banknotes (see the box on pp. 56 f.). Accordingly, of the seven shadow economy proxy variables used, only the tax and social contributions ratio has a statistically significant (positive) impact on the domestic demand for banknotes.⁴¹ If there is a sustained 1 percentage point increase in the tax and social contributions ratio, the growth rate of the domestic demand for banknotes goes up by 2.2 percentage points over the long term. This long-term multiplier is also economically significant. The quantitative contributions of the various determinants can be compared by decomposing the growth in the domestic demand for banknotes (see the chart on p. 52).⁴² Developments in the growth rate of the domestic demand for banknotes can be split into three phases. It was positive from the launch of euro cash until the end of 2006, then negative until the end of 2011, and has been positive again since then with a tendency to rise. Since 2012, the tax and social contributions ratio has made the largest contribution to growth in domestic demand, followed by the growth rates in cash consumption and card payments. This finding highlights the economic significance of the tax and social contributions ratio in the domestic demand for banknotes.

■ Conclusions

Cash payments are made without any technical devices by simply handing over banknotes and coins. As a result, cash transactions can be completed without third parties obtaining knowledge of the parties involved. By using cash in their daily lives, members of the general public can maintain their personal privacy. However, the anonymity of cash can be abused, for instance, in connection with tax evasion or trading in illegal goods.

This possible role of cash in the shadow economy, or as a means of funding crime, has been

under increased discussion for some time now. However, estimating the actual scale on which cash is being used for illegal purposes represents a challenge. Direct estimates – such as those that use the volume of cash in circulation or the demand for large-denomination banknotes to conclude that there is, supposedly, an extensive illegal use of cash – seem scarcely appropriate, as they do not take account of the legal function of cash as a store of value. Econometric estimates of the cash demand present a mixed picture overall of the significance of the shadow economy for the demand for cash in Germany. According to the Bundesbank's own empirical studies of the determinants of cash lodgements at Bundesbank branches as well as of the Bundesbank's cumulative net issuance of euro banknotes, no more than a few of the potential indicators of illegal cash use are significant in each case. These are, first, the self-employment rate and the number of drug-related offences, and, second, the tax and social contributions ratio. Generally, studies of the shadow economy refer to an unobservable variable, which means that the results can potentially depend to a large degree on the assumptions made and should be interpreted only with caution.

Finally, there remains the question of how far the shadow economy can be contained by restricting the use of cash. In this regard, there is still a lack of empirical evidence as to whether measures such as abolishing large-denomination banknotes or introducing upper limits for cash payments would, in fact, be an effective means of combating tax evasion and other criminal activities.⁴³

Extent of illegal cash use is difficult to estimate

Still no evidence for the effectiveness of restricting cash payments

Anonymity of cash protects personal privacy and allows undesirable uses

⁴¹ The terms “domestic banknote circulation” and “domestic demand for banknotes” have the same meaning, as banknote circulation is determined solely by the demand for banknotes.

⁴² This decomposition of growth is based on the static long-run equation for the domestic demand for banknotes.

⁴³ See Deutsche Bundesbank, Policy options for cash payments, Annual Report 2015, pp. 36-38.

volume of euro banknotes put into circulation by the Bundesbank in accordance with the accounting regime chosen by the Eurosystem (see also footnote 2 on banknote circulation in Table III.2). The volume of currency actually put into circulation by the

Bundesbank can be calculated by adding to this total the item "Intra-Eurosystem liability/claim related to banknote issue" (see "Other liability items"). ⁵ Excluding central governments' deposits. ⁶ In Germany, only savings deposits.

Discrepancies may arise from rounding. * The banking system's liquidity position is defined as the current account holdings in euro of euro area credit institutions with the Eurosystem. Amounts are derived from the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. 1 Figures are daily averages for the reserve maintenance period ending in the month indicated. Following the changeover in the frequency of Governing Council monetary policy meetings to a six-week cycle, a reserve maintenance period no longer ends in every month. No

figures are available in such cases. 2 Source: ECB. 3 Includes liquidity provided under the Eurosystem's asset purchase programmes. 4 From August 2009 includes liquidity absorbed as a result of the Eurosystem's foreign exchange swap operations. 5 From 2002 euro banknotes and other banknotes which have been issued by the national central banks of the Eurosystem and which are still in circulation. In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is

allocated to the ECB on a monthly basis. The counterpart of this adjustment is shown under "Other factors". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly basis, to the NCBS, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro banknotes allocated to an NCB and the value of the euro banknotes which that NCB has put into circulation is likewise shown under "Other

factors". From 2003 euro banknotes only. **6** Remaining items in the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. **7** Equal to the difference between the sum of liquidity-providing factors and the sum of liquidity-absorbing factors. **8** Calculated as the sum of the "Deposit facility", "Banknotes in circulation" and "Credit institutions' current account balances".

* The consolidated financial statement of the Eurosystem comprises the financial statement of the European Central Bank (ECB) and the financial statements of the national central banks of the euro area Member States (NCBs). The balance sheet items for foreign currency, securities, gold and financial instruments are valued at market rates at the end of the quarter. ¹ In accordance with the accounting

procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is allocated to the ECB on a monthly basis. The counterpart of this adjustment is disclosed as an "Intra-Eurosystem liability related to euro banknote issue". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly

III. Consolidated financial statement of the Eurosystem

Liabilities to non-euro area residents denominated in euro	Liabilities to euro area residents in foreign currency	Liabilities to non-euro area residents denominated in foreign currency			Counterpart of special drawing rights allocated by the IMF	Other liabilities ²	Intra-Eurosystem liability related to euro banknote issue ¹	Revaluation accounts	Capital and reserves	As at reporting date
		Total	Deposits, balances and other liabilities	Liabilities arising from the credit facility under ERM II

basis, to the NCBs, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro banknotes allocated to the NCB according to the aforementioned accounting procedure and the value of euro banknotes put

into circulation is also disclosed as an "Intra-Eurosystem claim/liability related to banknote issue". ² For the Deutsche Bundesbank: including DEM banknotes still in circulation. ³ Source: ECB.

IV. Banks

1. Assets and liabilities of monetary financial institutions (excluding the Bundesbank) in Germany *

governments. ³ In Germany, debt securities with maturities of up to one year are classed as money market paper; up to the January 2002 Monthly Report they were

published together with money market fund shares. ⁴ Statistical breaks have been eliminated from the flow figures (see also footnote * in Table II.1).

IV. Banks

2. Principal assets and liabilities of banks (MFIs) in Germany, by category of banks*

€ billion

End of month	Number of reporting institutions	Balance sheet total ¹	Cash in hand and credit balances with central banks	Lending to banks (MFIs)			Lending to non-banks (non-MFIs)					Participating interests	Other assets ¹
				Total	of which:		Total	of which:					
					Balances and loans	Securities issued by banks		Loans		Bills	Securities issued by non-banks		
								for up to and including 1 year	for more than 1 year

* Assets and liabilities of monetary financial institutions (MFIs) in Germany. The assets and liabilities of foreign branches, of money market funds (which are also classified as MFIs) and of the Bundesbank are not included. For the definitions of the respective items, see the footnotes to Table IV.3. ¹ Owing to the Act Modernising Accounting Law (*Gesetz zur Modernisierung des Bilanzrechts*) of 25 May 2009, derivative financial instruments in the trading portfolio (trading portfolio derivatives) within the meaning of Section 340e(3) sentence 1 of the German Commercial Code (*Handels-*

gesetzbuch) read in conjunction with Section 35(1) number 1a of the Credit Institution Accounting Regulation (*Verordnung über die Rechnungslegung der Kredit-institute*) are classified under "Other assets and liabilities" as of the December 2010 reporting date. Trading portfolio derivatives are listed separately in Statistical Supplement 1 to the Monthly Report – Banking statistics, in Tables I.1 to I.3. ² For building and loan associations: including deposits under savings and loan contracts (see Table IV.12). ³ Included in time deposits. ⁴ Excluding deposits under savings and

¹ The reserve maintenance period starts on the settlement day of the main refinancing operation immediately following the meeting of the Governing Council of the ECB for which the discussion on the monetary policy stance is scheduled. ² Article 3 of the Regulation of the European Central Bank on the application of minimum reserves (excluding liabilities to which a reserve ratio of 0% applies, pursuant to Article 4(1)). ³ Amount after applying the reserve ratio to the reserve base. The reserve ratio for liabilities with agreed maturities of up to two years was

2% between 1 January 1999 and 17 January 2012. Since 18 January 2012, it has stood at 1%. ⁴ Article 5(2) of the Regulation of the European Central Bank on the application of minimum reserves. ⁵ Average credit balances of credit institutions at national central banks. ⁶ Average credit balances less required reserves after deduction of the lump-sum allowance. ⁷ Required reserves after deduction of the lump-sum allowance.

* The interest rate statistics gathered on a harmonised basis in the euro area from January 2003 are collected in Germany on a sample basis. The MFI interest rate statistics are based on the interest rates applied by MFIs and the related volumes of euro-denominated deposits and loans to households and non-financial corporations domiciled in the euro area. The household sector comprises individuals (including sole proprietors) and non-profit institutions serving households. Non-financial corporations include all enterprises other than insurance corporations, banks and other financial institutions. The most recent figures are in all cases to be regarded as provisional. Subsequent revisions appearing in the following Monthly Report are not specially marked. Further information on the MFI interest rate statistics can be found on the Bundesbank's website (Statistics/Money and capital markets/Interest rates and yields/Interest rates on deposits and loans). ° The statistics on outstanding amounts are collected at the end of the month. 1 The effective interest rates are calculated

either as annualised agreed interest rates or as narrowly defined effective rates. Both calculation methods cover all interest payments on deposits and loans but not any other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance. 2 Data based on monthly balance sheet statistics. 3 Secured and unsecured loans for home purchase, including building and home improvements; including loans granted by building and loan associations and interim credits as well as transmitted loans granted by the reporting agents in their own name and for their own account. 4 Loans for consumption are defined as loans granted for the purpose of personal use in the consumption of goods and services. 5 For the purpose of these statistics, other loans are loans granted for other purposes such as business, debt consolidation, education, etc. 6 Including overdrafts (see also footnotes 12 to 14 on p. 47*).

For footnotes * and 1 to 6, see p. 44•. + For deposits with an agreed maturity and all loans excluding revolving loans and overdrafts, credit card debt: new business covers all new agreements between households or non-financial corporations and the bank. The interest rates are calculated as volume-weighted average rates of all new agreements concluded during the reporting month. For overnight deposits, deposits redeemable at notice, revolving loans and overdrafts, credit card debt: new business is collected in the same way as outstanding amounts for the sake of simplicity. This

means that all outstanding deposit and lending business at the end of the month has to be incorporated in the calculation of average rates of interest. ⁷ Estimated. The volume of new business is extrapolated to form the underlying total using a grossing-up procedure. ⁸ Including non-financial corporations' deposits; including fidelity and growth premiums. ⁹ Excluding overdrafts. ¹⁰ Annual percentage rate of charge, which contains other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance.

For footnotes * and 1 to 6, see p. 44*. For footnotes + and 7 to 10, see p. 45*.
¹¹ For the purposes of the interest rate statistics, a loan is considered to be secured if collateral (amongst others financial collateral, real estate collateral, debt securities) in at least the same value as the loan amount has been posted, pledged or assigned. ¹² Including revolving loans which have all the following features: (a) the borrower may use or withdraw the funds to a pre-approved credit limit without giving prior notice to the lender; (b) the amount of available credit can increase and decrease as funds are borrowed and repaid; (c) the loan may be used repeatedly;

(d) there is no obligation of regular repayment of funds. ¹³ Overdrafts are defined as debit balances on current accounts. They include all bank overdrafts regardless of whether they are within or beyond the limits agreed between customers and the bank. ¹⁴ Including convenience and extended credit card debt. Convenience credit is defined as the credit granted at an interest rate of 0% in the period between payment transactions effected with the card during one billing cycle and the date at which the debit balances from this specific billing cycle become due. ¹⁵ The amount category refers to the single loan transaction considered as new business.

¹ Data as of Q3 2016 are based on Solvency II supervisory data, valuation of listed securities at the corresponding consistent price from the ESCB's securities database. Up to and including Q2 2016 data are based on Solvency I supervisory data from the Federal Financial Supervisory Authority (BaFin), supplemented by estimates and Bundesbank calculations. In case of pension funds, occasional data breaks are due to changes in the calculation basis. ² Accounts receivable to monetary financial institutions, including registered bonds, borrowers' note loans and registered Pfandbriefe.

³ Including deposits retained on assumed reinsurance as well as registered bonds, borrowers' note loans and registered Pfandbriefe. ⁴ Not including the reinsurance business conducted by primary insurers, which is included there. ⁵ The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included.

¹ Data as of Q3 2016 are based on Solvency II supervisory data. Up to and including Q2 2016 data are based on Solvency I supervisory data from the Federal Financial Supervisory Authority (BaFin), supplemented by estimates and Bundesbank calculations. In case of pension funds, occasional data breaks are due to changes in the calculation basis. ² Including deposits retained on ceded business as well as registered bonds, borrowers' note loans and registered Pfandbriefe. ³ As of Q3 2016 insurance technical reserves "life" pursuant to Solvency II taking account of transitional measures. Up to and including Q2 2016 long-term net equity of households in life insurance (including ageing provisions of health insurance schemes and premium reserves of accident insurance schemes with guaranteed premium refund) and pension fund re-

serves pursuant to ESA 1995. ⁴ As of Q3 2016 insurance technical reserves "non-life" pursuant to Solvency II. Up to and including Q2 2016 unearned premiums and reserves for outstanding claims pursuant to ESA 1995. ⁵ Not including the reinsurance business conducted by primary insurers, which is included there. ⁶ The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included. ⁷ Own funds correspond to the sum of net worth and the liability item "Shares and other equity".

¹ Bearer debt securities with maximum maturities according to the terms of issue of over 4 years if their mean residual maturities exceed 3 years. Convertible debt securities and similar, debt securities with unscheduled redemption, zero coupon bonds, floating rate notes and bonds not denominated in euro are not included. Group yields for the various categories of securities are weighted by the amounts out-

standing of the debt securities included in the calculation. Monthly figures are calculated on the basis of the yields on all the business days in a month. The annual figures are the unweighted means of the monthly figures. ² End of year or month. ³ Source: Deutsche Börse AG. ⁴ Only debt securities eligible as underlying instruments for futures contracts; calculated as unweighted averages.

Source: Bundesbank calculations based on Federal Statistical Office data. ¹ Annual figures based on the calculations of the Federal Statistical Office. Bundesbank supplementary estimations for the reporting years after 2011 that are not yet available. The quarterly figures contain numerous off-budget entities which are assigned to the general government sector as defined in the national accounts but are not yet included in the annual calculations. From 2012 also including the bad bank FMSW. ² The annual figures do not tally with the sum of the quarterly figures, as the

latter are all provisional. The quarterly figures for some insurance sectors are estimated. ³ The development of the types of expenditure recorded here is influenced in part by statistical changeovers. ⁴ Including discrepancies in clearing transactions between central, state and local government. ⁵ On the revenue side, this contains proceeds booked as disposals of equity interests and as loan repayments. On the expenditure side, this contains the acquisition of equity interests and loans granted. ⁶ Including central government liquidity assistance to the Federal Employment Agency.

Source of the unadjusted figures: Federal Statistical Office. * For explanatory notes, see Statistical Supplement 4 – Seasonally adjusted business statistics, Tables II.10 to II.12. ◦ Using JDemetra+ 2.2.1 (X13). ¹ Share of gross value added at factor cost of the production sector in the base year 2015. ² From July 2018 deflated by producer price index based on the 2015 weighting scheme. Until June 2018 the producer price

index based on the 2010 weighting scheme is used. ³ Influenced by a change in holiday dates. ^x Provisional; estimated and adjusted in advance by the Federal Statistical Office to the results of the Quarterly Production Survey and the Quarterly Survey in the specialised construction industry, respectively.

Sources: Federal Statistical Office; Federal Employment Agency. * Annual and quarterly figures: averages; calculated by the Bundesbank; deviations from the official figures are due to rounding. 1 Workplace concept; averages. 2 Monthly figures: end of month. 3 Number within a given month. 4 Mid-month level. 5 Relative to the total civilian labour force. 6 Excluding government-assisted forms of employment, including jobs located abroad. 7 From January 2017 persons receiving additional income assistance (unemployment benefit and unemployment benefit II at the same time) shall be assigned to the legal category of the Third Book of the Social Security

Code (SGB III). 8 Initial preliminary estimate by the Federal Statistical Office. 9 Unadjusted figures estimated by the Federal Employment Agency. In 2016 and 2017 the estimated values for Germany deviated from the final data by a maximum of 1.1% for employees subject to social contributions, by a maximum of 0.4% for persons solely in jobs exempt from social contributions, and by a maximum of 70.0% for cyclically induced short-time work. 10 From May 2018 calculated on the basis of new labour force figures.

* Non-financial groups admitted to the Prime Standard segment of the Frankfurt Stock Exchange which publish IFRS consolidated financial statements on a quarterly or half-yearly basis and make a noteworthy contribution to value added in Germany. Excluding groups engaged in real estate activities. 1 Earnings before interest, taxes, depreciation and amortisation. 2 Quartile data are based on the groups' unweighted return on sales. 3 Annual figures do not always match the sum of the two half-year

figures. See Quality report on consolidated financial statement statistics, p. 3. 4 Adjusted for substantial changes in the basis of consolidation of large groups and in the reporting sample. See the explanatory notes in Statistical Supplement 4 – Seasonally adjusted business statistics. 5 Including groups in agriculture and forestry. 6 From this point onwards: significant changes in IFRS standards, impairing comparability with previous periods.

^o Assets and liabilities vis-à-vis all countries within and outside the euro area. Up to December 2000 the levels at the end of each quarter are shown, owing to revaluations, at market prices; within each quarter, however, the levels are computed on the basis of cumulative transaction values. From January 2001 all end-of-month levels are valued at market prices. ¹ Mainly net claims on TARGET2 balances (according to the

respective country designation), since November 2000 also balances with non-euro area central banks within the ESCB. ² Mainly long-term debt securities from issuers within the euro area. ³ Including estimates of currency in circulation abroad. ⁴ See Deutsche Bundesbank, Monthly Report, October 2014, p. 22. ⁵ Euro opening balance sheet of the Bundesbank as at 1 January 1999.

* The effective exchange rate corresponds to the weighted external value of the currency concerned. The method of calculating the indicators of the German economy's price competitiveness is consistent with the procedure used by the ECB to compute the effective exchange rates of the euro (see Monthly Report, November 2001, pp. 50-53, May 2007, pp. 31-35 and August 2017, pp. 41-43). For more detailed information on methodology, see the ECB's Occasional Paper No 134 (www.ecb.eu). A decline in the figures implies an increase in competitiveness. ¹ ECB calculations are based on the weighted averages of the changes in the bilateral exchange rates of the euro vis-à-vis the currencies of the following countries: Australia, Bulgaria, Canada, China, Croatia, Czechia, Denmark, Hong Kong, Hungary, Japan, Norway, Poland, Romania, Singapore, South Korea, Sweden, Switzerland, the United Kingdom and the United States. Where current price and wage indices were not available, estimates were used. ² ECB calculations. Includes countries belonging to the

group EER-19 (see footnote 1) and additionally Algeria, Argentina, Brazil, Chile, Iceland, India, Indonesia, Israel, Malaysia, Mexico, Morocco, New Zealand, Philippines, Russian Federation, South Africa, Taiwan, Thailand, Turkey and Venezuela. Due to the redenomination of the Venezuelan bolivar on 20 August 2018, the spot rate from 17 August 2018 is used since then. ³ Annual and quarterly averages. ⁴ Euro area countries (from 2001 including Greece, from 2007 including Slovenia, from 2008 including Cyprus and Malta, from 2009 including Slovakia, from 2011 including Estonia, from 2014 including Latvia, from 2015 including Lithuania) as well as Canada, Denmark, Japan, Norway, Sweden, Switzerland, the United Kingdom and the United States. ⁵ Euro area countries (current composition) and countries belonging to the group EER-19. ⁶ Euro area countries (current composition) and countries belonging to the group EER-38 (see footnote 2).

Overview of publications by the Deutsche Bundesbank

This overview provides information about selected recent economic and statistical publications by the Deutsche Bundesbank. Unless otherwise indicated, these publications are available in both English and German, in printed form and on the Bundesbank's website.

The publications are available free of charge from the External Communication Division. Up-to-date figures for some statistical datasets are also available on the Bundesbank's website.

■ Annual Report

■ Financial Stability Review

■ Monthly Report

For information on the articles published between 2000 and 2018 see the index attached to the January 2019 Monthly Report.

Monthly Report articles

April 2018

- Wage growth in Germany: assessment and determinants of recent developments
- Germany's external position: new statistical approaches and results since the financial crisis
- Current regulatory developments in the field of payments and in the settlement of securities and derivatives
- Maastricht debt: methodological principles, compilation and development in Germany

May 2018

- The current economic situation in Germany

June 2018

- Outlook for the German economy – macro-economic projections for 2018 and 2019 and an outlook for 2020
- Lower bound, inflation target and the anchoring of inflation expectations

July 2018

- The market for Federal securities: holder structure and the main drivers of yield movements
- The realignment of the Chinese economy and its global implications
- Trends in the financing structures of German non-financial corporations as reflected in the corporate financial statements statistics

August 2018

- The current economic situation in Germany

September 2018

- Models for short-term economic forecasts: an update
- The performance of German credit institutions in 2017

October 2018

- State government finances: comparison of developments, debt brakes and fiscal surveillance
- The macroeconomic impact of uncertainty

- Activities of multinational enterprise groups and national economic statistics
- The growing importance of exchange-traded funds in the financial markets

November 2018

- The current economic situation in Germany

December 2018

- Outlook for the German economy – macro-economic projections for 2019 and 2020 and an outlook for 2021
- German enterprises' profitability and financing in 2017
- Germany's international investment position: amount, profitability and risks of cross-border assets

January 2019

- The impact of an interest rate normalisation on the private non-financial sector in the euro area from a balance sheet perspective
- Price competitiveness in individual euro area countries: developments, drivers and the influence of labour market reforms
- Financial cycles in the euro area
- IFRS 9 from the perspective of banking supervision

February 2019

- The current economic situation in Germany

March 2019

- German balance of payments in 2018
- Cash demand in the shadow economy

Statistical Supplements to the Monthly Report

- 1 Banking statistics^{1, 2}
- 2 Capital market statistics^{1, 2}
- 3 Balance of payments statistics^{1, 2}
- 4 Seasonally adjusted business statistics^{1, 2}
- 5 Exchange rate statistics²
