#### Economic conditions

#### **Underlying trends**

German economic data give mixed signals

Economic data for the German economy sent mixed signals at the start of the fourth quarter of 2022. On an average of October and November, enterprises were significantly less satisfied with their business situation than in the third quarter, according to the ifo Institute. Output figures for October brought a positive surprise, however. This is particularly true of the main construction sector, which recorded a marked increase despite sharply declining new orders. Industry kept its output at roughly the same level as in the third quarter, although energy-intensive sectors continued to contract significantly. By contrast, retail sales continued their steep decline - both in nominal and in real terms. Consumers showed a marked hesitance to buy, with high inflation diminishing their purchasing power and concerns about high energy costs dampening their propensity to spend. In November, the consumer climate index compiled by the market research institute GfK departed only slightly from its record low in October. Enterprises' business expectations as surveyed by the ifo Institute also improved somewhat in November, but were still very pessimistic. Economic output in Germany is likely to decline in the fourth quarter on the whole, although probably somewhat less sharply than previously expected.1

Industry

In October 2022, seasonally adjusted<sup>2</sup> industrial output fell a little short of the September level (-½%), although this September figure was also revised upwards significantly. Output increased slightly compared with the third-quarter average, however (+½%). A dichotomy between sectors is evident. In the energy-intensive sectors,<sup>3</sup> especially in the chemicals industry, out-

put fell sharply again, while continuing to fare well in the other industrial sectors. Production of intermediate goods declined overall, but much less sharply than in the energy-intensive sectors, all of which are included here. For intermediate goods that are not classified as energy-intensive, the manufacture of fabricated metal products rose, for example, driven by massive increases in weapons and ammunition. Consumer goods production remained roughly at the same level as the third quarter but production of capital goods increased significantly. In particular, the manufacture of motor vehicles and motor vehicle parts was well above the third-quarter average in October. According to data on passenger car production provided by the German Association of the Automotive Industry (VDA), the automotive industry is likely to have performed well in November, too. These figures show that the production level was significantly higher than that of October. Overall, despite the tight energy supply and high costs, industry is likely to come through the fourth quarter relatively unscathed.

Industrial new orders stabilised again somewhat in October, following substantial declines in August and September. They were up slightly on the previous month in seasonally adjusted terms (+3/4%). However, the order level remained well below the average of the third quarter (-2%). Excluding large orders, new orders were down even more markedly (-23/4%). Large orders have a longer lead time and thus have a delayed impact on the production fig-

Industrial new orders up slightly due to large orders, but well below the third-quarter average

- 1 For more on the November economic situation, see Deutsche Bundesbank (2022). For further information on the macroeconomic outlook, see pp. 17 ff. of this Monthly Report.
- **2** Seasonal adjustment here and in the remainder of this text also includes adjustment for calendar variations, provided they can be verified and quantified.
- **3** Energy-intensive sectors include the manufacture of chemicals and chemical products, the manufacture of basic metals, the manufacture of coke and refined petroleum products, the manufacture of non-metallic mineral products, and the manufacture of paper and paperboard.

Industrial output split between energy-intensive and less energyintensive sectors, but stable overall

<sup>\*</sup> For explanatory notes, see Statistical Section, XI, and Statistical Series — Seasonally adjusted business statistics. 1 Excluding government-assisted forms of employment and seasonal jobs. 2 Not seasonally and calendar-adjusted.

ures compared with other orders. Broken down by region, incoming orders from both Germany and abroad declined distinctly, with a comparatively strong drop in orders from the euro area. Broken down by sector, new orders were considerably lower for intermediate goods and somewhat lower for capital goods. The inflow of orders stagnated in the case of consumer goods. Among producers of capital goods, however, the automotive industry and manufacturers of other transport equipment received more orders than the average of the third quarter.

In October, industrial sales were up only slightly on the month in seasonally adjusted terms (+1/4%). Compared with the third-quarter average, however, they were distinctly higher (+11/4%) and even after price adjustment, there was still a small rise (+1/2%). This increase was mainly driven by foreign sales, particularly to non-euro area countries. Broken down by sector, sales of capital goods rose steeply in line with production. In particular, sales of other transport equipment, mainly in the building of ships and boats, were very significantly higher in October than the third-quarter average. The automotive industry also saw a significant increase in sales. By contrast, consumer goods producers posted only a slight uptick in sales. Sales of intermediate goods were down somewhat, with chemical products experiencing a strong decline.

Nominal exports rose slightly in October compared with the previous month (seasonally adjusted +3/4%) and significantly compared with the average of the third quarter (+11/2%). The increase was even more pronounced after price adjustment due to falling export prices. This was partly due to decreasing prices for energy exports, as natural gas became significantly cheaper in October. By contrast, there was no decline in export prices for intermediate, consumer and capital goods. Broken down by country group, nominal exports to the euro area's partner countries were weak. However, exports to non-euro area countries more than

Nominal industrial sales up somewhat

Nominal exports up, imports down significantly

Deutsche Bundesbank

offset this decline. In October, nominal imports were considerably lower than in the previous month (seasonally adjusted -21/4%) and the average of the third quarter (-2%). After price adjustment, the decrease was somewhat smaller, as import prices for energy and intermediate goods fell in October. Unlike in the case of exports, nominal imports from noneuro area countries were particularly weak, although imports from the euro area were able to mitigate the decline somewhat. Roughly the same amount was spent on Russian goods in October (€1.79 billion) as in September. In August, before the complete suspension of natural gas deliveries, the figure had been €2.83 billion.

#### Construction

Surprisingly steep rise in construction output in October

Construction output rose steeply in October. It was up by 41/4% on the month in seasonally adjusted terms and by around 31/4% on the third quarter. The increase was surprisingly substantial in both the main construction sector and the finishing trades. In the short term, the favourable weather conditions probably had a positive impact on activity in the main construction sector. According to ifo Institute surveys, disruption to construction activity due to weather conditions was well below the longterm monthly average in October. The share of enterprises affected by a shortage of materials also declined again recently. However, the positive development in October is unlikely to continue. High construction prices and lending rates are tending to depress demand, suggesting a slowdown in construction activity.4 According to the ifo Institute, the assessment of the business situation improved slightly in November but it remained at an exceptionally low level. In addition, the number of construction firms complaining of a lack of orders was already significantly higher in November than in the previous months. This is also a reflection of the downward trend in new orders in the main construction sector over the past few months.

#### Labour market

Employment was up distinctly in October in seasonally adjusted terms, after having remained unchanged in the third quarter. Given the gloomier economic outlook and the substantial increase in the minimum wage in October, this illustrates how extraordinarily stable the German labour market is. The number of persons in work went up by 32,000 on the month. Employment subject to social security contributions also grew somewhat more strongly in September (more recent data are unavailable at present) than on average in the previous months. However, take-up of shorttime work was once again stronger than it has been recently. In September, the number of persons in short-time work doubled on the month, albeit from a relatively moderate level. The employment outlook improved again in November. In particular, the ifo employment barometer, which had previously fallen significantly, saw a distinct recovery and now lies in expansionary territory.

after adjustment for seasonal variations. The unemployment rate was up by 0.1 percentage point to 5.6%. Ukrainian refugees did not cause an increase, as some of the refugees from the war dropped out of the unemployment statistics by joining language and integration courses. Total underemployment went up more strongly as a result, as that figure includes persons involved in active labour market policy measures and in integration measures. The slight increase likewise recorded in registered unemployment in the statutory unemployment insurance scheme suggests that the high level of labour market tightness is easing as the economy slows down. This process is likely to continue over the next few months as well, ac-

cording to the unemployment barometer of

the Institute for Employment Research (IAB).

However, given how employment is expected

Registered unemployment rose slightly by

17,000 persons to 2.54 million in November

Employment up in October, outlook stable

Slight increase in unemployment

to develop, this cannot be taken to indicate a strong short-term increase in unemployment.

#### **Prices**

Crude oil price distinctly lower, European gas prices up significantly The price of crude oil continued to come under marked pressure recently. Various factors came into play here. The subdued global economy weighed on oil demand. The G7 nations agreed on a relatively high price cap for Russian crude oil, which is unlikely to curtail Russia's crude oil exports all that much. In addition, at the start of December, OPEC member states and their partners decided not to cut their own production any more than previously planned for the time being. As this report went to press, a barrel of Brent crude oil cost US\$82. Crude oil futures were trading at minimal discounts, amounting to US\$3½ for deliveries 12 months ahead. By contrast, European wholesale gas prices have risen significantly in recent weeks to €139 per megawatt hour due to the cold weather. This is around 36% more than last year.

Inflation at upstream stages and in sales somewhat weaker recently, mainly due to energy At the upstream stages of the economy, the exceptionally high price pressures by historical standards recently eased somewhat. In October, prices in European gas markets in particular experienced a significant fall compared with the previous month. This was reflected in a further marked reduction in the price of energy imports. In addition, domestic energy prices came down for the first time. Year-on-year inflation was 23.5% for imports and 34.5% for domestic products. In both cases, this was markedly lower than in September. Alongside energy, price increases for imports and production of intermediate goods declined again somewhat, while the rate of price increase for capital and consumer goods remained unchanged at a high level.

Inflation rate still double-digit in November In November, consumer price inflation weakened and the Harmonised Index of Consumer Prices (HICP) rose by just 0.4% on the month in seasonally adjusted terms. The year-on-year increase was still in the double digits, however,

and amounted to 11.3%, down from 11.6% in October.<sup>5</sup> In particular, the extremely strong energy inflation decreased somewhat, although the already very high growth in food prices picked up once more. The increase in prices of industrial goods and services was similarly significant to October. The core rate (excluding energy and food) thus remained at 5.1% in November. Inflation rates are likely to become significantly more volatile in the coming months. The first stage of the gas price brake envisages the government paying gas bills in December. This could push the inflation rate down into single digits. Starting in January, inflation is set to then rise again markedly, although the second stage of the gas price brake and the electricity price brake are likely to dampen the inflation rate already. Overall, there is still a high degree of uncertainty about price developments in the coming months. Besides the uncertainties surrounding the inclusion of the price brakes in the official price statistics, one of the factors contributing to this is the plan to rebase the national consumer price index to base year 2020 with effect from January 2023. Nevertheless, the underlying inflationary pressures in Germany are likely to remain high for the time being.6

#### Public finances<sup>7</sup>

# Statutory health insurance scheme

The statutory health insurance scheme (comprising the health insurance institutions and the

**<sup>5</sup>** The national consumer price index (CPI) stood at 10.0%, down from 10.4%. CPI and HICP inflation rates differ significantly at the moment, as the HICP has a greater share of goods than the CPI and goods (including energy and food) currently have higher inflation rates than services. Services have a lower weight in the HICP than in the CPI, as the HICP does not include owner-occupied housing.

<sup>6</sup> See p. 35 f. of this Monthly Report.
7 The short commentaries on public finances present cash outturns that were not yet available when the previous quarterly report on public finances (February, May, August and November) went to press. A broad overview of the data can be found in the statistical section of the Monthly Report

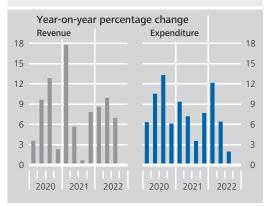

Statutory health insurance scheme in Q3: small surplus, and thus considerable improvement on the year

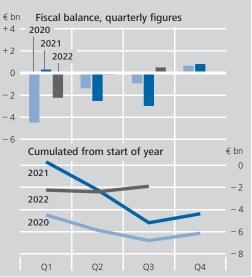

health fund) posted a surplus of €½ billion in the third quarter of 2022. Without lagged central government refunds, the surplus would have amounted to €1 billion. This result marks a significant improvement on the third quarter of 2021, when a deficit of €3 billion was recorded. Additional central government grants are the main reason for this positive development. These grants are intended to offset the health insurance institutions' funding gap expected back in autumn 2021 by the group of statutory health insurance estimators in order to stabilise supplementary contribution rates. The funding gap is predominantly structural in nature. In the previous year, the health insurance institutions covered the funding gap using their reserves.

Strong revenue growth – not least due to additional central government funds The statutory health insurance scheme's revenue was up by 7% on the same guarter of 2021, not least because of higher central government payments. Central government issued an additional grant of €3½ billion. In 2022, it is paying additional grants totalling €14 billion in quarterly instalments. In 2021, central government paid an additional grant of €5 billion in the first quarter only. By contrast, its refunds for pandemic-related special expenditure fell by €1½ billion. Contribution receipts grew by 51/2%, bolstered in part by the large pension increase at mid-year. Average supplementary contribution rates – which were up slightly, by 0.1 percentage point - contributed only ½ percentage point to this.

Expenditure only moderately higher overall, as pandemicrelated expenditure fell The expenditure of the statutory health insurance scheme rose moderately, by 2%. The health fund's falling pandemic-related payments had an easing effect. This pandemic-related expenditure was mainly due to coronavirus tests for the general public (€1½ billion), financial assistance to hospitals and the fund's share of vaccination costs (€½ billion in each case). In addition, there were special payments of €½ billion to nursing staff providing long-term care. These special payments had not yet been reimbursed by central government, leading to a temporary negative impact on the re-

# Finances of the statutory health insurance scheme\*

Source: Federal Ministry of Health. \* Health fund and health insurance institutions (consolidated). Preliminary quarterly figures. The final annual figures differ from the total of the reported preliminary quarterly figures as the latter are not revised retroactively.

Deutsche Bundesbank

sult. Health insurance institutions' spending on benefits climbed by 4%. In this context, base effects in opposing directions make it difficult to assess the underlying developments in the individual benefit areas. Overall, expenditure on benefits was 14½% higher than in the same quarter of the pre-crisis year of 2019.8 Administrative expenditure grew by just over 5% on the year.

The statutory health insurance scheme could post a significant surplus for 2022 as a whole.

<sup>8</sup> Growth in the contribution base was significantly weaker during this period, totalling 10½%.

2022: significant surplus for statutory health insurance scheme This would be a considerable improvement on the previous year (deficit of €5½ billion for 2021 according to final accounting figures). In the autumn of 2021, the group of statutory health insurance estimators expected a deficit of €2 billion for 2022. The better-thanprojected developments are mainly due to a stronger rise in earnings subject to compulsory contributions. Furthermore, the average supplementary contribution rate is just under 0.1 percentage point higher than estimated. However, expenditure rose somewhat more sharply after the first three quarters than projected in autumn 2021 by the group of statutory health insurance estimators for the year as a whole.9 Overall, a surplus of just over €2 billion is thus on the cards for 2022.

2023: high deficit in the statutory health insurance scheme – health fund to use up available reserves

For 2023, the assumptions made by the group of statutory health insurance estimators in the autumn of 2022 anticipate a large deficit of €7 billion in the statutory health insurance scheme. The lion's share (€5 billion) is attributable to the health fund. According to the estimators' assumptions, this deficit corresponds to the available funds in the health fund's liquidity reserve at the end of 2022. The applicable new minimum reserve is 50% lower, at 0.25 times the scheme's monthly expenditure. For the last time, the fund will transfer funds to compensate the health insurance institutions for losses caused by the reduction of statutory health insurance contributions on occupational pensions since 2020, drawing on its liquidity reserve (€1/2 billion). In addition, the health insurance institutions will receive a one-off special grant of €41/2 billion. However, the deficit could still be just over €1 billion higher than projected, due to the fact that the health fund will still transfer just over €1/2 billion from its liquidity reserve to the Innovation Fund and the Structural Fund. Moreover, the health insurance institutions will receive an additional €1/2 billion from this for improvements in the areas of obstetrics and paediatrics. As the health fund is likely to close 2022 in a better position than projected by the group of estimators, the liquidity reserve is nonetheless unlikely to fall below its minimum level.

The smaller part of the statutory health insurance scheme's deficit is attributable to the health insurance institutions. The group of statutory health insurance estimators expects the institutions' spending to rise by 41/2% in 2023 despite savings, above all in the area of pharmaceuticals. On the revenue side, the health insurance institutions will receive contribution receipts and central government funds. The latter (excluding pandemic-related refunds) will fall by €11 billion on the year. 10 Transfers from the health fund's liquidity reserve will increase to the aforementioned €5 billion. In order to limit the necessary rise in the supplementary contribution rate, the health insurance institutions are supposed to withdraw €2½ billion from their reserves. These funds will be redistributed among the health insurance institutions. 11 In addition, the upper limit on reserves will be lowered from 0.8 to 0.5 times the scheme's monthly expenditure. If a health insurance institution then still has remaining funding gaps, it must close them by raising its supplementary contribution rate as necessary. The Federal Ministry of Health accordingly raised the supplementary contribution rate for 2023 by 0.3 percentage point to 1.6%.

For 2023, the government is focusing mainly on temporary measures to close the structural funding gap. In doing so, it is putting off taking action that is fundamentally necessary. As things stand, in 2024 all special payments from central government will have come to an end and, according to the plans, the buffers in the reserves will have been used up. As the underlying funding pressures on the statutory health insurance scheme are unlikely to ease, the pres-

Health insurance institutions to record a marked deficit – with their reserves largely depleted, too

Temporary
measures covering structural
funding gaps —
fundamental
reforms
announced

**<sup>9</sup>** Excluding the health fund's pandemic-related special expenditure, which is reimbursed by central government.

**<sup>10</sup>** Next year, central government will provide an additional grant of €2 billion. Furthermore, it will issue a loan of €1 billion, to be repaid by the end of 2026.

**<sup>11</sup>** The health fund will make smaller transfers to health insurance institutions with larger reserves and larger transfers to health insurance institutions with smaller reserves.

sures on the (supplementary) contribution rates will then increase. The Federal Minister of Health has therefore announced a comprehensive financial reform for next year. Hospital remuneration is also expected to change, albeit without impacting on the scheme's finances overall.

# Public long-term care insurance scheme

Considerable deficit due to reform of longterm care The core budget of the public long-term care insurance scheme was €1½ billion in deficit in the third quarter of 2022.¹² This constitutes a deterioration of €1 billion compared with the same quarter of the previous year and is mainly due to additional expenditure generated by the recent reform of long-term care.

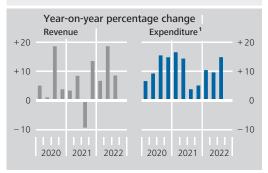

Contribution receipts rose steeply; additional central government funds for longterm care bonus Revenue rose by 8½%, with contribution receipts growing by 6%. Almost 1 percentage point of this increase was due to the fact that the contribution rate for childless persons also rose by 0.1 percentage point to 3.4% at the beginning of the year as part of the benefit reform. Alongside contribution receipts, central government provided additional funds of €½ billion in order to pay a bonus to nursing staff providing long-term care.

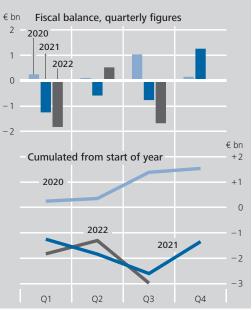

12 The developments outlined here and in the remainder of the text exclude the provident fund. Since 2015, this fund has been receiving transfers from the core area corresponding to receipts of 0.1 percentage point of the contribution rate. Assets accumulated in this way are to be depleted in the 2030s to dampen the expected contribution rate rise.

13 Other special payments to long-term care facilities and for coronavirus tests remained broadly unchanged. Overall, they amounted to €1½ billion. The long-term care insurance scheme reimbursed non-residential and (semi-)residential long-term care facilities for coronavirus testing costs. Furthermore, these facilities received financial compensation for additional expenditure relating to the pandemic. They were also compensated for revenue shortfalls caused by the non-utilisation of long-term care services on account of the pandemic. But even if there had been no pandemic, the long-term care insurance scheme's spending on benefits would still have been higher.

**14** The co-contribution rate of long-term care recipients drops to 30% after a three-year period of residence. The limitation on residents' co-contribution does not apply to fees for accommodation, food and investment.

### Finances of the public long-term care insurance scheme\*

Source: Federal Ministry of Health. \* Preliminary quarterly figures. The final annual figures differ from the total of the reported preliminary quarterly figures as the latter are not revised retroactively. 1 Including transfers to the long-term care provident fund.

Deutsche Bundesbank

At 15%, growth in expenditure was much stronger still. Coronavirus-related special payments increased by one-third, in connection with the bonuses paid to nursing staff providing long-term care. ¹³ However, the rise in other expenditure was also strong, at 13%, which was mainly attributable to spending on inpatient care (+24%). The reason for this is the reform of long-term care: since the beginning of this year, the long-term care insurance scheme has been taking on a greater share of the costs as the length of residence in long-term care homes increases. ¹⁴ In the draft law, the Federal Government projected additional expenditure of €2½ billion in 2022 for this purpose. How-

Expenditure grew even more strongly because of long-term care bonuses and benefit increases ever, the outturns for the first three quarters of the year point to markedly higher expenditure. Cash benefits continued to grow by a substantial 7% even though benefit rates remained unchanged. ities came to  $\le$ 61.7 billion. The outstanding volume of foreign debt securities in Germany fell by  $\le$ 1.0 billion in the reporting month, pushing up the outstanding volume of debt instruments in the German market by  $\le$ 60.7 billion overall.

During the reporting month, the public sector

increased its capital market debt by €61.0 bil-

lion net (following net redemptions of €20.9

billion in September). On balance, central gov-

ernment issued primarily ten-year Federal

bonds (Bunds: €39.0 billion), 30-year Federal

bonds (Bunds: €8.0 billion), two-year Treasury

notes (Schätze: €8.3 billion) and Treasury dis-

count paper (Bubills: €6.2 billion). This con-

trasted with net redemptions of five-year Fed-

eral notes (Bobls) amounting to €8.2 billion.

State and local governments issued bonds

worth €2.2 billion net.

2022: deficit could be lower than in 2021 thanks to central government funds A deficit appears to be on the cards for the year as whole, although it will probably be markedly smaller than in 2021 (€1½ billion). The sharp increase in spending on benefits would normally have led to a significantly higher deficit. Furthermore, coronavirus-specific expenditure increased. Under the 2022 long-term care reform, central government provides a regular grant of €1 billion. In addition to this, however, it paid further grants amounting to just over €2 billion, as well as issuing a loan of €1 billion this year, to be repaid by the end of 2023. The significant growth in earnings subject to compulsory contributions over the year as a whole is another positive influence.

Net public sector issuance

2023: further benefit increases announced, contribution rate likely to rise over the course of the year Although costs arising from special coronavirus payments will be absent next year, the long-term care insurance scheme will nevertheless be in structural deficit. In addition, the Federal Minister of Health plans to expand benefits again in mid-2023. Amongst other things, long-term care rates are then set to rise. In addition, the long-term care insurance scheme will have to repay the central government loan granted in 2022. Overall, available reserves will probably already be used up in the first half of 2023. A higher contribution rate would then be needed to close the funding gap.

Domestic credit institutions pared back their capital market debt by €6.2 billion in the month under review, compared with borrowing activity amounting to €32.1 billion in the previous month. In this context, the outstanding volume of debt securities issued by specialised credit institutions – which also include public promotional banks – fell by €9.8 billion. Mortgage Pfandbriefe and public Pfandbriefe were issued in the amount of €3.4 billion and €0.2 billion net, respectively.

Fall in credit institutions' capital market debt

#### Securities markets

#### **Bond market**

High net issuance in the German bond market in October 2022 At €174.0 billion, gross issuance in the German bond market in October 2022 was up on the previous month (€159.4 billion). After deducting redemptions, which were somewhat lower than in September, and taking account of changes in issuers' holdings of their own debt securities, net issuance of domestic debt secur-

Domestic enterprises issued bonds worth €6.8 billion net in October, compared with €3.9 billion in the previous month. Overall, this was entirely attributable to issuances by other financial institutions, which on balance solely issued bonds with maturities of up to one year.

Net issuance by enterprises

On balance, domestic non-banks were the main buyers of debt securities in the month under review, adding a net €73.7 billion in bonds to their portfolios. These consisted entirely of domestic debt securities on balance. Domestic credit institutions expanded their bond portfolios by €4.2 billion, likewise purchasing exclusively domestic assets. Holdings of bonds in the Bundesbank's portfolio in-

Purchases of debt securities

creased by €3.6 billion net. Foreign investors offloaded German debt securities amounting to €20.9 billion net.

#### **Equity market**

Low net issuance of German equities In October, domestic enterprises placed only small quantities of new shares in the German equity market (€0.6 billion, following €38.8 billion in the previous month). The volume of foreign equities in the German market fell by €3.5 billion during the same period. Ultimately, shares were purchased solely by non-resident investors (€2.2 billion). Domestic non-banks sold shares worth €3.5 billion on balance, including domestic shares worth €1.6 billion. Domestic banks offloaded solely foreign assets (-€1.6 billion).

#### Mutual funds

Higher inflows to mutual funds

Domestic investment funds recorded net inflows of €4.0 billion in October (previous month: €1.3 billion). On balance, specialised funds reserved for institutional investors were the chief beneficiaries of such inflows (€3.6 billion). By contrast, retail funds sold their own certificates only to a small extent (€0.3 billion). Among the fund providers, the main sellers of new shares were mixed securities funds (€11.4 billion), followed to a lesser extent by real estate funds (€2.0 billion) and bond funds (€1.1 billion). By contrast, funds of funds redeemed their own shares to the tune of €7.9 billion net. The outstanding volume of foreign mutual fund shares distributed in Germany increased by €1.0 billion in October. Domestic non-banks were almost the sole buyers of mutual fund shares on balance (€5.7 billion). Foreign investors pared back their domestic fund portfolios by €0.8 billion in net terms, while domestic credit institutions left their holdings virtually unchanged on balance.

#### ■ Balance of payments

Germany's current account recorded a surplus of €5.9 billion in October 2022, almost half of the previous month's result. This was caused by the narrower surplus in the goods account and the shift into a deficit in invisible current transactions, which comprise services as well as primary and secondary income.

Current account surplus down

In October, the surplus in the goods account fell by €3.7 billion to €6.4 billion because receipts recorded a sharper decrease than expenditure.

Fall in goods account surplus

Invisible current transactions shifted from a surplus of €1.5 billion in September into a deficit of €0.5 billion. Net receipts in primary income in fact grew by €0.4 billion to €11.3 billion, with expenditure narrowing somewhat more sharply than receipts. However, the deficit in the secondary income account widened signifi-

Invisible current transactions shifted into deficit due to higher deficits in secondary income and services

Deutsche Bundesbank

cantly by €1.3 billion to stand at €5.3 billion. The main reason for this was lower receipts, with reduced government income from current taxes on income and wealth playing a role. In addition, expenditure rose somewhat. Although payments to the EU budget in connection with financing related to gross national income went down, general government expenditure on current transfers relating to international cooperation recorded significant growth. Moreover, the deficit in the services account expanded by €1.2 billion to €6.5 billion. Receipts, in particular, declined, with lower receipts in transport and charges for the use of intellectual property contributing to this contraction. The increase in travel expenditure counteracted the predominantly receding expenditure in other areas.

In October 2022, financial markets were dominated by high global inflation rates and expectations of further monetary policy tightening in the major economies. Germany's crossborder portfolio investment generated net capital exports of €15.4 billion (September: net capital imports of €7.6 billion). Non-resident investors reduced their holdings of German securities by €19.3 billion, disposing of money market paper in particular (€17.9 billion), but also selling bonds (€3.0 billion) and a small volume of mutual fund shares (€0.8 billion). By contrast, they purchased shares of German enterprises to the tune of €2.4 billion. Resident investors parted with foreign securities (€3.9 billion) on balance, offloading shares (€3.9 billion) and money market paper (€2.4 billion), whilst acquiring bonds (€1.4 billion) and mutual fund shares (€1.0 billion). In October, transactions in financial derivatives recorded outflows of €5.2 billion (September: €10.5 billion).

Direct investment recorded net capital exports of €10.8 billion in October (September: €2.5 billion). Enterprises domiciled in Germany expanded their direct investment funds abroad by €19.8 billion. They boosted their cross-border equity capital (€23.5 billion), with reinvested profits accounting for around one-third of this

Portfolio investment sees net capital exports

Direct investment records capital outflows capital. By contrast, they reduced the volume of loans to business units abroad (€3.7 billion) – chiefly in the form of financial loans. Conversely, foreign enterprises stepped up their investment in Germany (€9.0 billion), raising their equity capital in affiliated enterprises in Germany by €1.1 billion and granting additional loans to domestic business units (€7.9 billion). On balance, this lending exclusively took the form of financial credits as trade credits were mainly redeemed.

Net capital imports in other investment

Other statistically recorded investment – which comprises loans and trade credits (where these do not constitute direct investment), bank deposits and other investments – registered net

inflows of capital amounting to €8.2 billion in October (following €13.9 billion in September). The Bundesbank's net external claims declined by €20.0 billion, with TARGET2 claims falling by €36.6 billion. At the same time, however, deposits from non-euro area residents decreased as well. Monetary financial institutions excluding the Bundesbank also registered net capital imports (€4.0 billion). By contrast, the transactions by enterprises and households (€13.0 billion) and by general government (€2.8 billion) resulted in net capital exports.

Deutsche Bundesbank (2022), The German economy, Monthly Report, November 2022, p. 49.

Deutsche Bundesbank Monthly Report December 2022 16 While the German economy is likely to contract in the current winter half-year, it will not experience a severe downturn. Due to additional gas imports from other countries as well as reduced consumption, a gas shortage is unlikely to occur despite the cessation of deliveries from Russia. However, the energy crisis will boost inflation. As a result, real disposable income and household consumption will fall until mid-2023. High energy costs will weigh on production, especially in energy-intensive industry. This will dampen exports. In addition, foreign demand will wane. The elevated level of uncertainty and higher financing costs will depress investment amongst enterprises and in housing construction. Real government consumption will decline as pandemic-related spending comes to an end.

From the second half of 2023 onwards, the German economy will gradually recover. This is because foreign demand is expected to rise, uncertainty will abate, price pressures from energy commodities will diminish, and the rate of inflation will fall. As the labour market will remain robust and wages will see strong growth, real household income and private consumption will increase again.

In these circumstances, the German economy will contract by 0.5% in calendar-adjusted terms next year, after expanding by 1.8% this year. It will grow by 1.7% in 2024 and by 1.4% in 2025. Macroeconomic production capacity will not return to normal levels of utilisation until 2025. Compared with the June projection, the rate of change in gross domestic product (GDP) for 2023 has been revised considerably downwards. This is due to the massive deterioration in conditions regarding the supply of energy, weaker growth in foreign demand, and higher financing costs.

The rate of inflation as measured by the Harmonised Index of Consumer Prices (HICP) is expected to be 8.6% this year. It will fall to 7.2% next year, partly because of the government's electricity and gas price brake. Inflation rates will continue to decline in the following years. The headline rate will diminish to 2.8% by 2025. By contrast, the core rate (excluding energy and food) will first continue to rise slightly in 2023, climbing to 4.3%. It will subsequently decline to 2.6% by 2025. Price inflation, however, will remain high owing to the pressure from labour costs as well as to rebound effects after the electricity and gas price brake has expired. Compared with the June projection, both the headline and core rates have been revised markedly upwards again for every year.

The government will provide substantial support to enterprises and households during the energy crisis, especially in the form of broad-based subsidies and other transfers. At the same time, the measures related to the pandemic will come to an end. On balance, the deficit will rise from  $2\frac{3}{4}\%$  of GDP this year to 4% next year. Thereafter, the support measures will be gradually phased out and the deficit will fall to around  $1\frac{1}{2}\%$  of GDP.

The risks to economic growth are tilted predominantly to the downside, mainly due to potential shortages in the supply of energy. With regard to inflation, upside risks predominate.

#### ■ Economic outlook¹

Despite the energy crisis, the German economy saw marked expansion in Q2-Q3 period

The German economy grew markedly over the 2022 summer half-year (April-September). Despite the crisis in the energy markets caused by Russia's war of aggression against Ukraine, GDP growth was only slightly lower in real terms than had been expected in the June projection.<sup>2</sup> Private consumption expenditure rose as anticipated, despite higher rates of inflation and rising consumer uncertainty. In this context, roles are likely to have been played by unexpectedly strong catch-up effects following the expiration of most of the pandemic containment measures as well as by additional government assistance measures. Investment, by contrast, was lacking. In particular, the housing sector was impeded to a larger extent by the very sharp increase in construction prices and higher interest rates.

Gas shortage likely to be avoided, even after cessation of gas deliveries from Russia With the cessation of gas deliveries from Russia to Germany, the key downside risk of the June projection became a reality. As a result, the spot market prices for both gas as well as electricity initially rose extremely sharply before falling significantly again. Furthermore, the uncertainty surrounding the energy supply and its costs considerably depressed the sentiment amongst enterprises and households. However, the outlook for the supply of gas, even without

Deutsche Bundesbank

deliveries from Russia, is now less critical than had been feared in June. This is due to additional deliveries from other countries, a significant reduction in gas consumption, and the fact that gas storage facilities are well stocked as a result. A gas shortage and an accompanying rationing of gas supplies have therefore become much less likely and are not assumed in the projection.<sup>3</sup> In order to mitigate the economic impact on households and enterprises resulting from the sharp rise in energy costs, the Federal Government also initiated extensive support measures, particularly the electricity and gas price brake (see pp. 23 f.).

The German economy is likely to contract in the current winter half-year. However, it is not experiencing a severe economic downturn, which had been forecast by the adverse scenario in the June projection, for example. Economic activity is likely to see a marked decline as early as the fourth quarter of 2022. According to the ifo Institute, enterprises' assessments of the business situation are deteriorating. The Bundesbank's weekly activity index (WAI) also shows a declining trend. Although enterprises' business expectations as surveyed by the ifo Institute recently brightened somewhat, they remain highly pessimistic. This also holds true for

While the German economy is likely to contract in the current winter half-year, it is not experiencing a severe downturn

- 1 This projection for Germany was finalised on 30 November 2022. It was incorporated into the projections for the euro area published by the ECB on 15 December 2022. 2 See Deutsche Bundesbank (2022a).
- 3 The assumptions regarding gas consumption that underlie the baseline scenario of this projection are based on the reductions in gas consumption observed since the cessation of gas deliveries from Russia. It is assumed that this and next winter will experience averagely low temperatures. Furthermore, it is assumed that there will be additional imports of gas (for example in the form of liquefied natural gas). For an adverse risk scenario that includes less favourable assumptions regarding the gas supply, amongst
- 4 The adverse scenario of the June projection incorporates other unfavourable assumptions alongside the cessation of gas deliveries from Russia. However, not all of these have fully materialised. For instance, there was no significant rise in the price of oil nor a slump in global economic activity. See Deutsche Bundesbank (2022b).

other factors, see the box on pp. 39 ff.

**5** When this projection was finalised, the WAI included high-frequency indicators, such as the toll index and credit card payments, that were available up to the end of November 2022. Until recently, the GDP growth rate for the past 13 weeks implied by the WAI was distinctly in negative territory. See Deutsche Bundesbank (2022c).

the expectations surveyed by the Association of German Chambers of Commerce and Industry, which cover a slightly longer period of time. Overall, economic output is likely to continue to decline somewhat in the first quarter of 2023 and marginally in the second quarter.

Multiple factors lead to a broadbased decline in economic activity

The expected decline in economic activity will be broadly based and the result of multiple factors. Households will be confronted with a decline in the purchasing power of their incomes due to high inflation and will therefore reduce their consumption expenditure. This will affect retailers and other consumption-related service providers. Furthermore, as in many other sectors, these will themselves be burdened by the high costs of energy. Energy-intensive industry has already sharply cut back production and is likely to scale it back even further at first. On the whole, however, industry is likely to remain fairly unscathed through the winter. Although new orders have fallen sharply since the beginning of the year, order books are still well filled. In addition, some industrial sectors will benefit from easing tensions in global supply chains. This could mitigate the downward pressure on exports stemming from the reduced competitiveness and weakening foreign demand caused by high energy costs. Investment will also be dampened by elevated uncertainty and higher financing costs. The downturn in the construction sector will continue. Lastly, the end of coronavirus pandemic-related expenditure on vaccination and testing will lead to a distinct drop in government consumption.

From the second half of 2023, the German economy will gradually recover The German economy is expected to gradually recover from the second half of 2023. Slightly before that time, exporters will receive their first boost to growth from foreign demand, which is assumed to rise (see pp. 22 f. for more information on the assumptions). This will also drive business investment, especially as uncertainty starts to abate. As a result of progress made in diversifying the energy supply, energy commodity price pressures will gradually diminish. As the labour market will remain robust and nominal wages will rise sharply, real wages

Deutsche Bundesbank

wards, and the rate for 2024 has likewise been revised slightly downwards. The decisive factor for these downward revisions is primarily the massive deterioration in supply conditions, particularly with regard to the energy supply, following the Russian war of aggression against Ukraine. However, weaker growth in foreign demand and higher financing costs also play a role.

At present, the German economy is operating considerably below its medium-term performance potential. Macroeconomic production capacity will not return to more or less normal levels of utilisation until 2025. Until that time, however, the output gap will not be due to any lack of demand, but will instead be primarily the result of supply disruptions, especially with regard to energy. To a certain extent, these disruptions may be considered temporary.6 Nevertheless, it cannot be assumed that, in the long term, the costs of energy supply in Germany will return to their levels from before the current energy crisis. This will lead to losses in value added. For this reason, the estimate of the German economy's potential output was downgraded steeply (see the box on pp. 29 f.). The growth rate of potential output is now estimated at +0.8% for the current year, +0.6% for 2023, +0.4% for 2024, and +0.7% for 2025.

Economy will not reach potential output until 2025

#### Economic activity in detail

Private consumption has risen sharply over the course of the year so far, despite the extraordinary uncertainty caused by the war in Ukraine and the high rates of inflation. This is chiefly due to catch-up effects following the rollback of virtually all coronavirus pandemic containment measures in the spring. These upward forces continued to dominate in the third quar-

Private consumption expenditure declines significantly at first ...

**6** The Bundesbank's estimate of potential output is based on a disaggregated production function. See Deutsche Bundesbank (2007, 2012). The estimation of potential output incorporates the trend allocation of production factors. By definition, the sustainable supply-side performance of a national economy is not directly affected by temporary or cyclical phenomena.

#### Underlying conditions for macroeconomic projections

This projection is based on assumptions made by Eurosystem experts about the global economy, exchange rates, commodity prices and interest rates. These were made on the basis of information available as at 23 November 2022. The assumptions regarding economic activity in the euro area are derived from projections from the national central banks of the euro area countries. These projections incorporate those fiscal policy measures that have been either adopted or adequately specified and are deemed likely to be implemented.

With regard to the war in Ukraine and its ramifications, it is assumed that the conflict will gradually abate, but that sanctions will remain in force. This projection likewise presupposes that it is possible to avoid a situation in which a shortage of gas in the euro area would lead to rationing. In addition, it expects that more and more bottlenecks in the supply of intermediate inputs will be resolved.

# Weakening global economic growth amid gradual easing of high price pressures

High inflation in many countries is weighing on global consumption. The considerable rise in energy prices and uncertainty about future energy supply are also taking their toll on business activities, especially in Europe. In China, strict restrictions imposed to combat the COVID-19 pandemic and turmoil in the real estate market are dampening demand. At the same time, the progressive tightening of monetary policy in many countries is having a negative impact on economic activity, too.

In the summer half-year (April-September) of 2022, the global economy expanded at a

somewhat weaker pace than expected in the June projection. However, given the negative factors, the outlook for the current winter half-year (October 2022-March 2023) has deteriorated. Global economic growth in the next two years is now also expected to be lower than previously estimated.

Growth in the global economy excluding the euro area looks set to slow to 2½% in 2023, after rising by 3½% in 2022. It is then expected to return to somewhat higher rates of 3% and 3½% in 2024 and 2025. At 5½% this year, the uptick in international trade (excluding the euro area) is higher than the rise in global gross domestic product (GDP) and what had been projected in the June outlook. The projected growth rates of 2% in 2023 and 3½% in 2024, however, will subsequently lag behind June expectations. A rise of 3½% is anticipated for 2025.

#### Effects of Ukraine war weighing on economic activity in euro area; high inflation rates eroding purchasing power

Economic recovery in the euro area in the summer half-year was much better than expected, driven especially by the recovery in the services sector following the end of pandemic-related restrictions. However, the impact of burdens associated with the Ukraine war is likely to be stronger than expected in June — and this is set to continue well into next year. The deterioration in global economic activity is also holding back developments in exporters' sales mar-

<sup>1</sup> The projections made by the national central banks of the euro area countries were completed on 30 November 2022.

#### Major assumptions of the projection

Item	2022	2023	2024	2025

In euro. 9 Calendar adjusted.

Deutsche Bundesbank

kets. In addition, with monetary policy normalisation now under way, the cost of credit-financed expenditure has risen. Overall, this will slightly depress economic activity in the winter half-year. The economy will be able to expand at a stronger pace again - towards the latter part of the projection horizon - only once uncertainty decreases, inflation rates go down, more supply bottlenecks are resolved and foreign demand rebounds. This year, a growth rate of 4.1% is expected for the euro area (excluding Germany). Next year, at an average rate of 0.8%, economic activity will expand at a much weaker pace than had been assumed in the June outlook. At 2.0%, the rate projected for 2024 will then be somewhat lower still. A rate of 1.9% is anticipated for 2025.

German exporters' sales markets are likely to see somewhat slower growth than world

trade over the projection horizon. This is because the EU economies that have close ties with Germany are being more adversely affected by the Ukraine war and the energy crisis.

#### Technical assumptions of the projection

Following completion of the June projection, energy commodity prices initially rose further. With Russia first sharply cutting back its supply of natural gas to Europe through the Nord Stream 1 pipeline and then terminating it altogether at the beginning of September, European gas prices accelerated to new highs in this period. Thanks to other gas-producing countries expanding their supply, increased imports of liquefied natural gas (LNG), successful energy-saving efforts and the mild weather conditions, the EU's natural gas reservoirs are now just about replenished. Against this background, the European prices for gas and - due to their close relationship - electricity fell quite significantly in the months leading up to the projection cut-off date. In the meantime, both prices have already picked up again, and futures prices indicate that this trend will continue in the winter months. Market quotations suggest that the decline in prices for crude oil observed since the summer will continue in the coming year. Electricity and gas prices are also expected to fall in 2024 and 2025 but will remain significantly higher than the prices projected in June.2 Given the gloomier global economic outlook, other commodity prices are expected to decline steeply on average in the coming year and to rise only marginally in the two years thereafter.

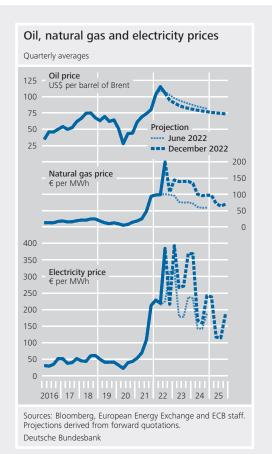

Agricultural producer prices in the euro area temporarily slipped slightly from the peak reached in the summer months – probably

**<sup>2</sup>** For a historical comparison of the high prices of fossil fuels, see Deutsche Bundesbank (2022d).

partly due to the resumption of grain exports from Ukrainian ports. However, they have risen again in recent months. The assumptions derived from futures quotations suggest that producer prices for food will remain high. In 2024 and 2025, they are set to weaken slightly, but will remain, on the whole, well above the June projection.

The Eurosystem discontinued its net asset purchases under the asset purchase programme (APP) as of 1 July 2022. Given the considerable rise in inflation, the prospect of the inflation rate remaining above the 2% target for an extended period of time and further upside risks, the ECB Governing Council decided to raise its key interest rates – by 50 basis points in July, 75 basis points in September and a further 75 basis points at its October meeting. The Governing Council expects policy rates to continue to increase. In the money market, interest rates have gone up significantly in recent months. In addition, EURIBOR futures are on a far steeper upward trajectory into the coming year than had been assumed in the June outlook. Against this backdrop, yields on ten-year Federal bonds (Bunds) also went up significantly. The yield trajectory derived from futures prices will remain more or less constant over the projection horizon - similar to what was assumed in the June outlook, but at a much higher level. Distinctly higher financing costs are also expected for bank loans.

The tightening of monetary policy in the United States, which foreign exchange markets perceive to be stronger than in the euro area, caused the euro to depreciate further after the June projection was completed. In the period underlying the exchange rate assumptions, the euro was trading at US\$1.03, 2% lower than assumed in the June projection. However, increases in value against the pound sterling, yen and renminbi contributed to a 1¼% ap-

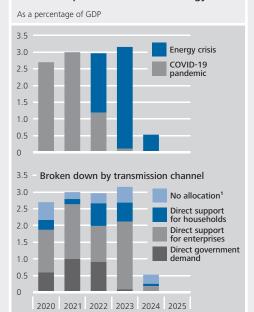

preciation of the euro against 42 currencies of major trading partners.

# Fiscal policy shaped by energy crisis and high inflation

Temporary, crisis-related fiscal measures have a major impact on the outlook for public finances. This year, they will push up the government deficit by around 3% of GDP (see the chart on p. 24).<sup>3</sup> Coronavirus-related measures are still exerting pressure on the government budget, albeit to a lesser extent than in 2021. Transfers to enterprises and healthcare expenditure constitute the main strains. In addition, there are extensive new support measures in response to the energy crisis and high inflation. Payments to gas trading companies

**<sup>3</sup>** This definition does not include longer-term fiscal expenditure plans, such as those for climate change mitigation and the military.

\* Bundesbank estimate. 1 VAT rate and energy tax rate cuts, ticket price cut for local public transport, and revenue shortfalls due to employers' one-off payments being exempt from income tax and social contributions.

Deutsche Bundesbank

(especially Uniper) and lump-sum transfers to households are particularly weighty in financial terms.

The coronavirus measures will largely expire in 2023. By contrast, new crisis assistance measures are increasing sharply. At around 2% of GDP, transfers to households and enterprises under the electricity and gas price brake are the largest of these measures. In addition, special assistance is being provided to enterprises that are severely affected by the energy crisis, in particular government capital injections to offset losses (capital transfers) and cost subsidies. Further measures have been implemented. For instance, employers' one-off payments of up to €3,000 are exempt from income tax and social contributions until the end of 2024. In addition, VAT on natural gas and district heating is being charged at a reduced rate up to the end of the first quarter of 2024.

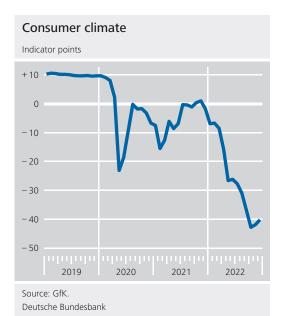

In 2024, transfers under the electricity and gas price brake will fall significantly in annual terms. This is because, in the projection, they will expire at the end of April 2024. In addition, in 2024, the government budget is not to supply any of the funding for the electricity price brake. This measure is to be financed instead from profits made on the electricity market between December 2022 and June 2023. Furthermore, the government will no longer be effecting any capital transfers to gas trading companies in 2024.

The projection also includes fiscal policy measures that will affect the government budget in the longer term. On the revenue side, income tax cuts are beginning to take effect. In particular, the tax scale is being shifted in order to compensate for bracket creep. The projection assumes that legislation will be passed in order to continue this practice in 2025. In addition, revenue from the EU programme NextGenerationEU (NGEU) will decrease next year.⁴ By contrast, contribution rates for the social security funds will be raised by just over 1 percentage point for 2023 and 2024 together. Health insurance scheme rates, in particular, will increase significantly. This will close the structural financing gap that is largely still being plugged by central government this year. On the expenditure side, investment in military machinery and equipment and spending on climate change mitigation are set to increase sharply based on projects under the Federal Armed Forces Special Fund and the Climate and Transformation Fund. Pension expenditure will be marked by the fact that pensions for persons with reduced earnings capacity will be extended from 2024 onwards.

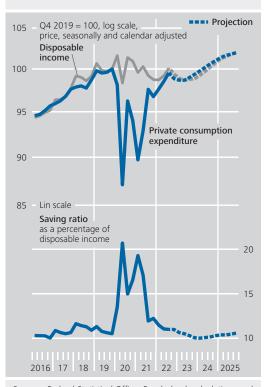

<sup>4</sup> In Germany, NGEU is primarily used to finance existing programmes, thus reducing the general government deficit resulting from this programme.

ter, but are now likely to have run their course. In the current winter half-year, households are likely to considerably reduce their consumption expenditure due to the high rates of inflation and the resulting decline in real disposable income. This will apply to more than just the consumption of electricity and heating energy. For instance, price-adjusted sales in retail trade and the accommodation and food service activities sector have been declining for several months now. Moreover, consumer sentiment is highly pessimistic. This likewise holds true for the business expectations among consumptionrelated service providers, such as retail trade and accommodation and food service activities, as surveyed by the ifo Institute. While the measures implemented by the Federal Government will mitigate the cost burden on consumers, they will not compensate for the losses in purchasing power. Some households will use some of their savings to smooth their consumption. However, given the expectation of rising energy costs and the uncertainty regarding the exact amounts of future energy bills, it is likely they will put money aside for future expenditure at the same time. On balance, the saving ratio will therefore fall only slightly in the current winter half-year.

... and increases again from mid-2023 as real disposable incomes rise Real disposable incomes will increase again from the middle of next year as inflation eases and real wages subsequently rise as well. Consumers will then spend more on goods and services again. In addition, the saving ratio will initially decline somewhat more once uncertainty goes down and the reserves built up in the winter are used for energy back-payments. Some of the savings accumulated during the pandemic-related restrictions on consumption will be unwound. The saving ratio will therefore remain below the pre-pandemic level for a number of quarters. This will stabilise consumption. Overall, private consumption will grow markedly in 2024 and 2025 and the saving ratio will largely normalise by the end of the projection horizon.7

#### Private consumption and saving ratio

Exports initially dampened by energy costs and weak demand, but more buoyant again from Q2 2023

pectations and new orders from abroad, which have been trending downward for some time. Although the order books - which are still well filled due to the shortage of intermediate goods - are a buffer against the weakening of demand, the export-oriented industry is suffering as a result of the high energy prices. The comparatively sharp rise in labour costs is placing an additional burden on price competitiveness. However, exports are likely to pick up again from the second quarter of 2023. The headwinds caused by energy prices and supply chain pressures should then gradually diminish and demand for goods manufactured in Germany should rise again significantly. The accu-

mulated order backlog is likely to temporarily provide a perceptible additional boost. Exports will, however, lose some momentum again towards the end of the projection horizon.

The burdens on the export sector will also affect business investment. In particular, firms are likely to postpone or completely scrap investment projects given the high degree of uncertainty regarding the energy supply and its costs. Increased financing costs will represent an additional burden. Against this backdrop, business investment is likely to decline markedly in the current winter half-year. As uncertainty gradually eases and foreign demand rises, investment is expected to rebound from the second guarter of 2023, however. Investment in vehicles, in particular, could temporarily stimulate catch-up effects if supply bottlenecks are resolved. The requirements for Germany's transition to a low-carbon economy are likely to support investment. This could be intensified further by the high energy costs.

financing costs of housing loans, in particular, have climbed significantly of late. This has

made credit-financed housing less affordable.

Added to this are heightened uncertainty, par-

ticularly regarding income developments, and

the limited scope for financing due to high in-

flation. This is likely to dampen demand for

housing markedly. In line with this, the number

of building permits has fallen sharply since the

beginning of the year and new orders for resi-

dential housing projects have seen a sharp decline recently. In addition, construction com-

panies are reporting a rising number of order cancellations, according to the ifo Institute.

However, the fundamental conditions for hous-

ing construction remain favourable. There is a

general need for additional housing and this

Business investment addition-

ally affected by

uncertainty and

financing costs

Housing investment declined sharply in the Recovery in summer half-year of 2022, much more strongly than expected in the June projection. The downturn is likely to continue well into the coming year, with several factors playing a role here. Alongside the sharp rise in construction costs that has persisted for some time now, the

housing investment only after strong and prolonged setback

could increase even further as a result of the high level of migration. Furthermore, the housing stock needs to be adjusted to the changed conditions, especially with regard to heating. Consistent with the robust labour market and the renewed rise in real income, housing investment is therefore likely to veer back onto an expansionary path towards the end of next year. Growth will be relatively moderate, though.

Temporary halt in house price inflation

Very strong rates of increase in housing prices continued until mid-2022. Amid the sharp rise in financing costs, house price growth subsequently ground to a virtual halt. Depressed housing demand is likely to cause prices to initially continue to stagnate. But, a tighter supply – as is anticipated – and the extremely high and ever rising construction costs will gradually drive prices back up. The generally intact demand for housing will also contribute to this. Overall, house prices will rise again during the course of 2023 and over the remainder of the projection horizon, albeit at a much slower pace than before.

Absence of pandemic-related health-care spending will reduce government consumption and dampen GDP next year

Government demand will significantly dampen economic activity next year. This is because pandemic-related healthcare spending is likely to largely tail off, which, taken in isolation, will reduce government consumption considerably. Higher government investment spending, particularly on military equipment, will not offset this. Real government demand will pick up again from 2024 and grow somewhat more strongly than real GDP.

Considerable rise in imports

Imports will rise considerably during the projection period. They are likely to initially decline in the current winter half-year. However, as exports and business investment rise from the second quarter onwards, imports will also rebound. High demand for imported intermediate inputs will arise via these two channels, in particular. This demand will be further strengthened by the uptick in private consumption that will take place later next year. Imports will then expand quite sharply in line with aggregate de-

mand over the remainder of the projection horizon.

Current account balance will temporarily dip well below 3% Germany's current account surplus will fall sharply this year. On an average for 2022, it could stand at just under 31/2% of GDP, following as much as 71/2% in 2021. The key factor is the considerable decline in the trade balance. This is reflected in the terms of trade, which hugely deteriorated as a result of the sharp increase in the prices of energy and other imported commodities. With regard to real trade flows, imports will also grow much more strongly than exports. The higher demand for imported goods and services this year is being supported, in particular, by private consumption, partly because of the normalisation in travel activity. The terms of trade will drop again significantly on average next year. They will only recover to some extent thereafter. The assumed decline in commodity prices and strong domestic inflation, which also affects export prices, will come into play here. All in all, the trade balance will continue to decline next year before subsequently rising somewhat. As a result, the current account surplus will fall to 21/2% of GDP in 2023 and will rise again slightly in 2024. It could stand at around 3% of GDP in 2025.

Labour market

Labour market showing sideways movement in Q3 The previously favourable labour market developments have given way to a sideways movement in recent months. Employment barely rose from an already very high level in the third quarter. Unemployment increased only marginally from its low level — if the effect of recording Ukrainian refugees is disregarded.8 A small proportion of the Ukrainian population in Germany were already able to take on jobs subject to social security contributions. Short-time work played only a minor role in the third quarter. Working hours per employee remained broadly stable at a comparatively low level.

The general statutory minimum wage, which has been raised sharply in two stages over the past few months, probably had minimal impact on employment and unemployment in the short term. Given the persistently high labour shortages – which extend to some unskilled labour segments – the minimum wage increases are likely to have had comparatively little impact on labour demand. This may also have been due to the fact that enterprises are likely to be able to push through price increases more easily in the current environment than in previous years.<sup>9</sup>

increase likely had no major short-term impact

Minimum wage

The high demand for labour compared with the labour supply suggests that the labour market will largely withstand the economic headwinds in the next few quarters. Enterprises' employment plans have weakened in recent months, but remain slightly positive. Although the number of job vacancies and the time taken to fill vacant positions have declined somewhat recently, they are still very high by historical standards. The high demand for labour is likely to decline somewhat in the current winter half-year. As a result, the hitherto tight labour market would ease to some extent. However, there are no signs of a major employment adjustment. For people who lose their jobs, the prospects of finding a new job are very good. In this respect, unemployment is also likely to rise only to a relatively minor extent. This is mainly due to increased frictional unemployment.

Labour market largely withstanding economic headwinds; high demand for labour declining somewhat

As the economic recovery begins in the second half of 2023, employment and the number of hours worked will also increase again, albeit at Moderate labour market recovery from mid-2023

**<sup>8</sup>** See Statistics provided by the Federal Employment Agency (2022), "Auswirkungen der Fluchtmigration aus der Ukraine auf den deutschen Arbeitsmarkt und die Grundsicherung für Arbeitsuchende", p. 12.

**<sup>9</sup>** For example, Bobeica et al. (2019) find that the relationship between wages and prices is narrower in times of high inflation, on the one hand, yet also more responsive to demand shocks than to supply shocks, on the other. As a result of the easing of measures to contain the coronavirus pandemic, demand is likely to have picked up in the services sector in particular, which is especially affected by the increase in the minimum wage.

# Impact of permanently higher energy costs on German potential output

The decline in natural gas deliveries from Russia and heightened uncertainty about energy supply caused energy prices in Germany to rise sharply this year. Energy prices in Germany are likely to be higher than before the current crisis over the long term as well. This is due, among other things, to the higher transport and production costs associated with the substitution of Russian natural gas by liquefied natural gas (LNG).¹ Over the projection horizon, energy prices are likely to more than double compared with 2019 and to remain elevated.²

A production function approach can be used to determine the supply-side effects of permanent energy price hikes.<sup>3</sup> The aggregate production function is expanded to take into account energy consumption as a further factor of production alongside labour and capital. In this model framework,

high energy prices mean that enterprises tend to reduce their energy use and – in the case of imperfect substitutes – their production. The calculations focus on the energy-intensive sectors industry and transport. By assumption, output in the rest of the enterprise sector is not directly affected in the calculations by high energy prices, yet spill-over effects emanating from industry and transport have a supply-dampening impact in the model framework.

The scale of output losses depends on the extent to which production declines when energy prices rise. This energy price elasticity of output can be derived by assuming a production structure with energy as an input factor.4 According to the model results, the projected sustained rise in energy prices dampens gross value added by around 41/2% in industry and 31/2% in transport. In addition, there is evidence of direct spillover effects from industry to the transport sector and the rest of the enterprise sector. 5 Overall, direct energy price and indirect spillover effects give rise to a negative supply effect of around 2% of gross value added.

# Direct and indirect supply effects of energy price increases

%, Bundesbank calculations

Item	Industry	Transport	Rest of enter- prise sector

Sectoral total contribution (in percentage points)	- 1.0	- 0.5	- 0.6
Total effect			- 2.1
Deutsche Bundesbank			

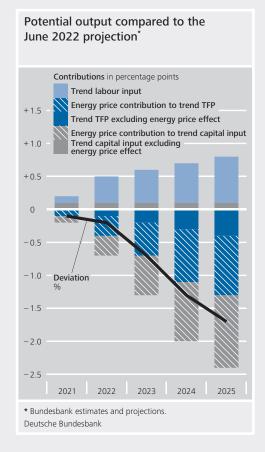

<sup>1</sup> See German Council of Economic Experts (2022).

<sup>2</sup> Energy price developments are modelled here on the energy imports deflator, which is largely dependent on the commodity prices for oil and gas assumed in the projection. A comparison with 2019 is more meaningful as energy prices fell briefly in 2020 as a result of the pandemic.

<sup>3</sup> See Knetsch and Molzahn (2012). In the second step, the identified energy price effects are incorporated into the Bundesbank's estimate of potential output, which is based on a medium-term oriented production function with capital and labour as inputs as well as total factor productivity (see Deutsche Bundesbank (2007, 2012)).

<sup>4</sup> See Knetsch and Molzahn (2012). According to the model results, the energy price elasticity of output depends on the (econometrically estimated) elasticity of substitution between energy and capital, the share of energy costs in production and the initial price of energy. The elasticity of substitution was estimated as a regression parameter using the ordinary least squares (OLS) method based on the energy demand function from the production model.

**<sup>5</sup>** They are based on cumulative impulse-response functions from vector autoregressions for the value added of industry, the transport sector and the rest of the enterprise sector. These spillover effects can arise, for example, through the interconnectedness of the economic sectors' value chains.

supply chains and the use of less tailored inputs in order to save costs are also likely to be reflected in the depressed trend TFP. Furthermore, parts of the capital stock will be rendered obsolete if energy-intensive investments are no longer profitable due to high energy costs. From today's perspective, the potential labour supply is barely affected by the rise in energy costs. It will benefit from the high influx of refugees from Ukraine in 2022 and 2023, however.

These results are subject to high uncertainty, the estimation uncertainty surrounding the model parameters playing a role here. Moreover, the results are heavily dependent on the assumption that energy price increases are permanent. They are therefore prone to revision with regard to possible future changes in energy supply and policy that impact energy prices, for example.

In this projection, potential output will be around 13/4% lower in 2025 than reported in the June projection. In addition to the identified energy price effects, there is also still the remaining impact, with a smaller contribution, of Russia's ongoing war against Ukraine. The downward revision is based in roughly equal measure on the contributions made by total factor productivity (TFP) and the capital stock. In particular, the higher cost of energy inputs will significantly weaken trend TFP. Disruptions to

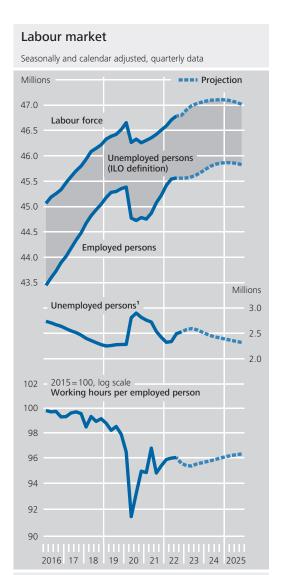

**6** Overall, the impact of the Ukraine war could cut German potential output by  $2\frac{1}{4}$ % up to 2025 – if it is also taken into account that potential output was already revised downwards in the June projection. This assessment is based on a comparison of the current estimate of potential output with that in the December 2021 forecast.

a comparatively moderate pace. On an annual average, the improvement will be particularly evident in 2024. Employment with full social security coverage will gain greatly in importance here — as in previous years. By contrast, the number of self-employed persons and persons exclusively in low-paid part-time employment will continue to go down. Labour shortages will gradually intensify again.

Immigration buoys labour supply over the projection horizon

The current high degree of labour market tightness is primarily a consequence of demographic shifts in the German population. Labour-related immigration will help to reduce this tension. In 2022 to date, immigration to Germany has been very high, mainly on account of refugees, especially from Ukraine. For the period from February to August alone, data from the Federal Statistical Office show that 874,000 people migrated from Ukraine in net terms. This figure is higher than that expected for 2022 as a whole in the June projection. However, as refugees from Ukraine are disproportionately women with children, many of these people are unavailable to the labour market, or are only available to a limited extent or not available immediately (due to integration measures, for example). This projection reckons with a net total of 1.3 million immigrants to Germany this year. Net immigration of 350,000 is assumed for 2023 and of 300,000 per year from 2024. Despite new immigrants' relatively low labour force participation for the time being, the labour force is growing more strongly in absolute terms than assumed in the previous projection. However, medium-term immigration is not high enough to prevent the demographic decline in the labour supply, even over the longer term.

Employment will still rise marginally until 2025; unemployment will fall almost to its prepandemic level Based on these assumptions, the labour force will decline from 2025 – one year later than expected in the June projection. Meanwhile, employment will continue to rise slightly due to underemployment falling. Amid rising demand for labour, the volume of work will also increase in the medium term as the result of an increase in the number of hours worked per

Sources: Federal Statistical Office, Federal Employment Agency and Bundesbank projections. **1** Unemployment according to national definition (in accordance with Section 16 of the Third Book of the German Social Security Code (*Sozialgesetzbuch*)). Deutsche Bundesbank

employee. This is corroborated, in particular, by the fairly low number of hours worked by parttime employees by international standards. Unemployment will fall nearly all the way back to its pre-pandemic level over the projection horizon.

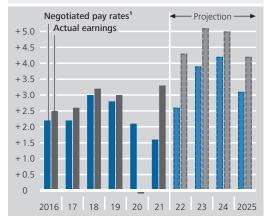

#### Labour costs and prices

Since the second quarter of 2022, wage agreements have been markedly higher than in previous years. Trade unions in the chemical and metal industries recently achieved unusually high wage increases of between 5% and 6% in

Deutsche Bundesbank

annualised terms. The high inflation played an important role in the pay negotiations and is also likely to be a major factor in upcoming wage negotiations. This is already reflected in the current, exceptionally high wage demands being posed by trade unions.

The most recent wage agreements are characterised by the fact that the rise in earnings is only partly based on permanent increases in scheduled rates of pay. In addition, tax-free and social contribution-exempt "inflation compensation bonuses" are being paid out. This will remain possible up to the end of 2024 as a measure to mitigate the high inflation. 10 This wage component structure is likely to serve as a template for upcoming wage negotiations in many sectors.

The major pay round in 2023 for approximately 10 million employed persons will likely remain caught between opposing forces: high inflation and labour market tightness, on the one hand, and depressed economic activity and uncertainty, on the other. Wage increases will probably be strong but insufficient to fully compensate for high inflation. This, coupled with the low wage settlements of the pandemic-shaped years of 2020 and 2021, will create a certain pressure to attain higher wage settlements in future. Together with the improved economic situation and the further increase in labour market tightness, pent-up wage demands in 2024 and 2025 will contribute to further sharp increases in negotiated rates of pay. Against this backdrop, in 2025 it will be possible to compensate in part for the inflation compensation bonuses that will have expired at the end of 2024. Nevertheless, the increase in negotiated rates of pay will then be a great deal lower once more, albeit still higher than during the pre-pandemic economic boom.11

increases over projection horizon

Strong wage

Actual earnings are rising considerably more steeply than negotiated wages this year. The main reasons for this are the decline in shorttime work and the increase in working hours. The increase in the general statutory minimum wage to €12 per hour in the fourth quarter of Actual earnings rise even more sharply than negotiated rates of pay

10 The Act on the Temporary Reduction of the Valued Added Tax Rate on Gas Deliveries via the Natural Gas Network (Gesetz zur temporären Senkung des Umsatzsteuersatzes auf Gaslieferungen über das Erdgasnetz), which was promulgated in the Federal Gazette on 25 October 2022, allows employers to grant their employees up to €3,000 tax-free and exempt from social contributions as an additional payment at any time between 26 October 2022 and the end of December 2024 to compensate for high inflation. This relief measure, referred to as the inflation compensation bonus, can be paid out in a lump sum or alternatively in multiple instalments.

11 All past pay agreements included in the Bundesbank's negotiated pay rate statistics (around 500 collective wage agreements and provisions governing civil servant pay) are factored into the projections of negotiated wage increases. They are extrapolated beyond their contractual term, taking into account the overall economic situation and industry-specific idiosyncrasies.

Combination of permanent wage increases and special taxfree and social contributionexempt bonuses 2022 will trigger a robust boost to wages, though this will not fully come to bear until 2023.<sup>12</sup> Added to this is the fact that, following a cyclical setback next year, the number of hours worked will climb significantly once more in the years thereafter. Furthermore, more paid overtime will accrue as a result of increasing labour market tightness. Wage drift is therefore set to be firmly in positive territory for the duration of the projection horizon. Actual wages will rise by around 5% in both 2023 and 2024 accordingly. These are the highest rates since German reunification. In 2025, wage growth could then fall considerably but remain very strong at slightly over 4%.

Unit labour costs rise sharply; domestic inflation remains high overall

Compensation per employee will rise at similarly high rates as actual earnings over the projection horizon. In combination with declining economic activity and stable employment, this means a strong boost for unit labour costs next year. Labour productivity will increase further in 2024, with the result that unit labour costs will still rise steeply, but with decreasing momentum. This trend is set to continue in 2025. The price pressure exerted by wage costs will therefore be consistently high over the projection horizon. Domestic inflation as measured by the GDP deflator is set to reach a rate of just over 5% in the current year. It will stand at a similar level next year, putting it well below the rise in unit labour costs, however. This is because profit margins and government subsidies will partly cushion the cost surge. Over the remainder of the projection horizon, the GDP deflator rate will remain high overall, though it will gradually decline somewhat.

Inflation rate in double digits since September At the consumer level, the underlying trend for price inflation in the summer half-year remained extremely strong, although measures to ease the rise in energy prices came into force. The inflation rate as measured by the HICP reached a new high of 8.7% in May, but then declined slightly with the introduction of the €9 public transport ticket and the fuel rebate in June. Both measures were in place until the end of August, and, in addition, the levy

imposed by the German Renewable Energy Act (Erneuerbare-Energien-Gesetz – EEG) was abolished in July. Nevertheless, the inflation rate in August was even slightly above its previous peak in May. With the €9 public transport ticket and the fuel rebate coming to an end in September, inflation entered double-digit territory for the first time in more than 70 years, expanding further to 11.3% by November. Back at the time of the June projection, by contrast, a rate of 7% had been expected for November. Price inflation was higher than expected across the board.

Energy inflation rose surprisingly strongly, despite the fact that relief in the form of the fuel rebate and the EEG levy was passed through to consumers more or less in full, as expected. This is probably also true of the recent reduction in the VAT rate on gas and district heating from 19% to 7%, which has been in force since October. However, consumer rates for electricity and gas were raised much more strongly than expected. This was presumably partly due to purchase prices having risen significantly more steeply than anticipated in the meantime. Another factor here is that higher supplier costs were probably passed on to a greater extent and/or more rapidly than was usual in the past. Furthermore, the prices of heating oil and diesel rose sharply despite the decline in the price of crude oil.13

Although European agricultural producer prices roughly matched expectations in the fourth quarter, consumer food prices were also well above the June projection. Cost increases in production and transport as well as the pro-

... but also the prices of food, industrial goods (excluding energy) and

services

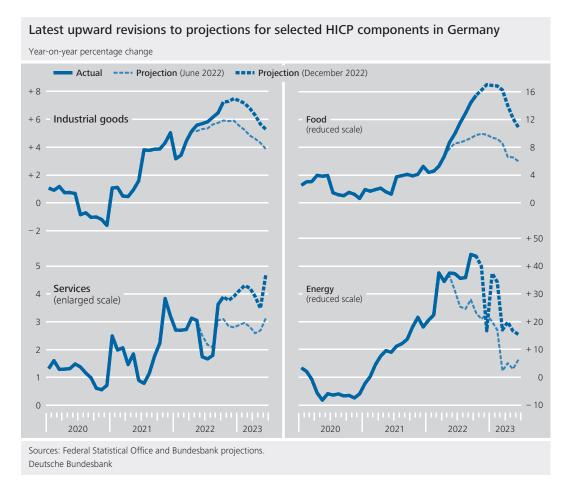

Not only energy prices rose more

strongly than

expected ...

<sup>12</sup> The higher minimum wage is expected to push up actual earnings by around 0.8 percentage point. See Deutsche Bundesbank (2022f). The general statutory minimum wage had already been raised on 1 January 2022 and 1 July 2022. In macroeconomic terms, these rises had a stronger impact on actual wages than on negotiated wages, even if the latter are being strongly affected in some low-wage sectors, such as accommodation and food service activities.

**<sup>13</sup>** This was due to a supply shortage caused by several factors, including a decline in imports from Russia and reduced refining capacity. For more information, see International Energy Agency (2022a).

tracted drought are likely to have contributed to this.14 Core inflation (the headline inflation rate excluding energy and food) rose surprisingly steeply, too. The fact that the euro depreciated unexpectedly against the US dollar and that price pressures were higher at the earlier input stages probably also caused the prices of industrial goods excluding energy to climb more substantially. Services inflation slightly exceeded the level anticipated in the projection as well. A stronger than expected widening of profit margins is likely to have played a role in this, particularly in sectors that were previously heavily affected by pandemic containment measures.

markedly dampen the HICP in December. The

The inflation rate is likely to remain very high for the time being. The government's assumption of the advance payment for gas, which is envisaged in the Act on Emergency Aid for Natural Gas Heating for End Consumers (Erdgas-Wärme-Soforthilfegesetz), will probably HICP rate could then temporarily fall below 10%. However, it is likely to return in January 2023 to a double-digit figure similar to that of November 2022. This is because consumer prices for electricity and gas are rising sharply according to the reference dataset used, they are, on average, still currently below the level that the electricity and gas price brake will reach by then. 15 Non-subsidised consumption

Inflation rate to remain very high for the time being ...

<sup>14</sup> Although the prolonged drought is also likely to have contributed to the rise in agricultural producer prices, this is difficult to substantiate, as relevant assumptions about agricultural producer prices are not available for all of the food products recorded in the HICP - for fruit and vegetables, for instance. However, these products were probably hit particularly hard by the drought.

<sup>15</sup> The impact of the electricity and gas brake was determined on the basis of the average prices for electricity and natural gas as calculated by the Federal Statistical Office for households in the first half of 2022. See Federal Statistical Office (2022). Here, the prices for the first half of the year are extrapolated using the Bundesbank's projection for the HICP for electricity and gas up to the end of 2022.

Source: Bundesbank calculations. 1 For temporary measures, a countereffect occurs of roughly the same size as in the month following expiry of the measure. 2 The one-off Act on Emergency Aid for Natural Gas Heating for End Consumers (Erdgas-Wärme-Soforthilfegesetz) in December 2022 is likely to dampen the HICP rate markedly in this month. 3 The effect in the month of implementation is weaker than on an annual average, because relief is still expected for subsequent months. As gas and electricity tariffs without price brakes continue to rise after January 2023 according to the projection, the effect of the brakes will intensify over the months that follow. 4 Implementation date according to assumption.

Deutsche Bundesbank

is likely to become particularly expensive. <sup>16</sup> In addition, for other goods and services, the heightened cost pressure from energy will increasingly compound other cost pressures.

However, after the beginning of 2023, the inflation rate could then fall short of its peak levels and decrease substantially in due course. On the one hand, the electricity and gas price brake will significantly dampen further increases in these energy components <sup>17</sup> In add-

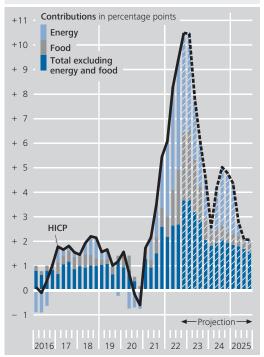

creases in these energy components.<sup>17</sup> In add
16 The subsidisation of energy prices in the context of the electricity and gas price brake will only begin in March for the lion's share of consumption, but will also be paid out retroactively for January and February. This means that the price brake will probably already have a dampening effect on the HICP at the beginning of the year. However, it will only mitigate the underlying rise in electricity and gas prices.

17 Consumers pay, at maximum, the respective highest

on the HICP at the beginning of the year. However, it will only mitigate the underlying rise in electricity and gas prices. 17 Consumers pay, at maximum, the respective highest price for a specified basic consumption, which is dependent on the consumption of the previous year (40 cent per kWh for electricity and 12 cent per kWh for gas). The remaining difference from the non-subsidised price is credited to them in the form of government transfers via suppliers – irrespective of whether they have actually met the basic consumption level. In this respect, no price cap has been set from an economic point of view.

Deutsche Bundesbank

... but will decline significantly over the course of next year ition, it is assumed that the oil price will decline, and the base effect of the sharp rise in energy prices in March 2022 will stop impacting on inflation. Furthermore, the introduction of the €49 "Deutschland-Ticket" public transport ticket, taken in isolation, is likely to have a dampening effect from the spring onwards. The core rate, by contrast, will remain high. It could rise to just over 4% next year and thus be slightly higher than in the current year. Overall, the inflation rate will fall to around 7% on an annual average in 2023, starting out at just over 81/2% this year. The various government measures to cushion the rise in energy prices are estimated to reduce the rates considerably in 2022 and even more so in 2023 (see the table on p. 35).

bound effects in electricity and gas prices (see the table on p. 35).

Further upward pressure on prices will come from the surge in wage costs, which will only ease off slightly in 2025. This is a major reason why inflation excluding energy will be markedly above its longer-term average in 2024 and 2025. In addition, the sharp rise in import prices will also drive prices over a prolonged period. However, price pressures will gradually diminish on this front, too, in part due to the subsiding of strains in global supply chains over the projection horizon. Lastly, Germany's transition to a low-carbon economy will create additional cost pressures.

Inflation excluding energy will also recede slightly, but will remain above average

Inflation rate substantially lower in 2024 and 2025, but still far above average The gradual easing of consumer prices is expected to continue into 2024 and 2025. However, price inflation will remain high. The projected inflation rate will fall to just over 4% in 2024, but will still stand at around 23/4% in 2025. The core rate is set to decrease to approximately 3% in 2024 and 21/2% in 2025.

Energy price inflation set to decline markedly, but expiry of electricity and gas price brake after April 2024 will lead to rebound effects There are various factors behind this expectation. For one thing, energy and food commodity prices are assumed to be falling. Although energy price inflation will likely decline distinctly on account of this, it will remain substantial. As electricity and gas suppliers sometimes buy energy on the stock exchanges far in advance, consumer prices will initially still have to be adjusted to previously increased market prices. Because of this, consumer prices will also not fall as sharply later, as the assumed decline in commodity prices might suggest. In addition, the cost increases will be passed through to many tenants only with a significant delay in any case, as the settlement payments are based on the previous heating period. For this reason, the levels of the end consumer rates, which will be decisive after the electricity and gas price brake expires in May 2024, are still likely to considerably surpass the limits of the price brake. This will then trigger strong re-

#### Public finances

According to this projection, the general government deficit ratio stands at 23/4% for 2022. This is a significant year-on-year decrease (2021: 3.7%). The economic recovery and the high inflation are providing budgetary relief, with inflation initially causing revenue to rise considerably faster than expenditure after factoring out new fiscal measures. Moreover, profit-related taxes are recording strong growth. This growth is significantly stronger than would have been expected on the basis of nominal macroeconomic variables and changes in tax law. There is barely any change in the volume of temporary support measures compared with 2021: pandemic-related budget burdens are decreasing, while financial assistance in response to the energy crisis is now being provided (for more on fiscal policy measures, see pp. 23 f.).

The deficit ratio will rise considerably in 2023, to 4%. The deficit will grow in size for a number of reasons. The volume of temporary support measures will increase, with transfers as part of the electricity and gas price brake, in particular, exceeding the coronavirus assistance ending in 2022. Moreover, the fact that high inflation will increasingly push up government

significantly in 2022 due to economic recovery and inflation

Deficit down

In 2023, burdens associated with energy crisis and high inflation will predominate, while deficit will see another significant rise

expenditure, such as on tangible goods purchases, will have a detrimental impact. Military expenditure will rise sharply as more funds are channelled out of the Armed Forces Fund. Lastly, the high level of profit-related taxes in 2022 will not be carried over in full to 2023. Meanwhile, the cyclical weakness of the real economy will not play a major role in the trajectory of the government budget, as inflation will be high at the same time and the labour market will remain robust. For example, nominal gross wages and salaries will rise sharply, which is especially relevant for revenue from direct taxes and social contributions - and thus for government finances as a whole.

The deficit ratio will then fall sharply in 2024, hitting 13/4%, and dip slightly further still to 11/2% in 2025. The main reason for this is that the support measures temporarily put in place will have already largely come to an end in 2024 and will have been completely phased out by 2025. Rising shortfalls in central government's off-budget entities for climate change mitigation and the armed forces will somewhat lessen the extent to which the deficit will shrink. Moreover, pension expenditure will go up significantly: aggregate wage increases will be reflected in large pension adjustments, and more and more baby boomers will reach retirement age.

Deterioration in structural balance as a result of higher expenditure

Deficit to fall significantly

from 2024 as

support meas-

ures come to

an end

The temporary measures are obscuring the general government structural balance. At the end of the projection horizon, the structural deficit will be around 1% of GDP.18 Prior to the COVID-19 crisis, structural surplus of 1/2% of GDP was still recorded in 2019. The reason for the deterioration can be attributed to expenditure: in particular, spending on pensions, climate change mitigation and the military, respectively, is rising considerably. By contrast, interest expenditure is playing a limited role: whilst interest rates have risen sharply and expenditure on inflation-indexed government securities is seeing a temporary sharp rise, the associated burdens remain rather small. This is due to the longer maturities of debt instruments and the small share of inflation-linked bonds.

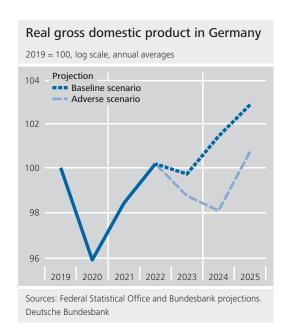

According to this projection, the debt ratio will shrink this year (2021: 68.6%). This is attributable mainly to the strong growth in nominal GDP in the denominator of the ratio. Moreover, due to the use of cash reserves accumulated during the COVID-19 pandemic, the deficit will not cause the debt level to go up as sharply. Government liquidity and capital measures resulting from the energy crisis that are not included in the deficit will increase the ratio only slightly. The debt ratio will then edge back upwards slightly next year. The general government deficit will rise significantly and nominal GDP will grow at a slower pace than in the current year. In addition, loans granted to build up capital stock for a funded pension and transfers to the IMF trust funds for low-income countries will push up the debt ratio. The increase will be dampened considerably due to non-recurring effects further diminishing. For instance, additional cash reserves from the COVID-19 pandemic will be used to finance the budget, and a growing number of assistance loans will be repaid. Furthermore, the scaling-back of government-owned bad banks' portfolios from the financial crisis of just over a decade ago will continue. In 2024 and 2025, the debt ratio will then fall markedly: according to this projection, it will amount to around 65% at the end of the projection horizon.

## Risk assessment

The macroeconomic projections described here are subject to an unusually high level of uncertainty in the current environment. The greatest unknowns include further developments in the war in Ukraine and the energy crisis triggered as a result, the consequences of government

18 Cyclical factors and non-recurring temporary measures have been stripped out of the structural variables. In the period under review, the temporary measures that have been stripped out are identical to the temporary crisis response measures (see the chart on p. 24).

Debt ratio will temporarily go back up in 2023

All in all, risks to economic growth tilted overwhelmingly to the downside, but risks to outlook for inflation rate tilted to the upside

Risks related to energy supply and Ukraine war countermeasures, and the impact of the high inflation. From today's perspective, the risks to economic growth appear to be tilted overwhelmingly to the downside in overall terms, due largely to the possibility of energy supply bottlenecks. With regard to inflation, upside risks predominate throughout the projection horizon.

In the baseline scenario of this projection, it is assumed that, despite halted Russian gas deliveries from September onwards, there will be no gap in the gas supply. However, the additional gas deliveries or gas savings required could also be smaller than expected, e.g. due to unusually cold weather. This could lead to gas being rationed, which would go hand in hand with a sharp decline in economic output and further price increases. Escalating geopolitical tensions in connection with the war in Ukraine also pose a risk. For example, sanctions could be expanded and supply chains affected by the war - those for grain, for instance - could be disrupted more severely or interrupted altogether, with potentially severe consequences for global and German economic activity. As a result, price pressures would probably be further intensified. For information on an adverse risk scenario of this nature, see the box on pp. 39 ff.

There are also unknowns relating to the government measures implemented to mitigate the energy crisis. If, for example, consumer electricity or gas prices are still well above the levels at which the price brake applies when the brake is due to end – as is envisaged in the projection - this measure could potentially be extended by law. This could cause inflation in 2024 and 2025 to be lower than expected, provided that the rebound effect contained in the projection would then be eliminated. 19 The projected inflation rate could also be lower if electricity and gas prices were to fall faster than assumed. Economic output would be supported in both cases, because the longer-term lower cost burden for firms and households would stimulate investment and consumption. However, where this is associated with higher energy consumption, this would cause the risks arising from energy bottlenecks to increase.

are other risks to the global economy. For example, despite China recently signalling some relaxation of its zero-COVID policy, the trajectory of the pandemic in the country could cause a global economic slowdown that is greater than anticipated. In this context, global supply chain problems could also temporarily worsen again, with corresponding pressure being put on world trade. Lastly, further geopolitical tensions would also entail downside risks for both the global economy and the German economy. Inflation in Germany could then be stronger if, for example, commodity prices were to increase or price pressures at the earlier input stages continued to go up. However, it is also conceivable that commodity prices could fall faster than assumed, e.g. if the global economy cools to a greater extent as a result of

Irrespective of any further possible disruptions

that could result from the Ukraine war, there

Risks to global economy, particularly due to China, with consequences for economic activity and inflation in Germany

weaker demand. As consumer prices for en-

ergy and food, in particular, are already at very

high levels, enterprises could then even pass

<sup>19</sup> Compared with a scenario excluding an electricity and gas price brake, the inflation rates are, other things being equal, lower during the period when the brake is in place and higher once it ceases to apply.

## An adverse risk scenario for the German economy

The macroeconomic projection (hereinafter referred to as the "baseline scenario") remains heavily influenced by the fallout from the Russian war of aggression against Ukraine and its global economic impact. An adverse risk scenario was created on the basis of various less favourable assumptions about this situation than in the baseline scenario. One assumption, for example, is that the conflict with Russia will be more severe and that geopolitical tensions will be greater than in the baseline.1 Regarding energy supply and consumption, it is assumed that additional gas deliveries from other countries will be smaller, that temperatures will be significantly lower than average in the coming and subsequent winter and that cuts in gas consumption will be less substantial. Furthermore, the adverse risk scenario includes additional disruptions to foreign trade and heightened supply chain problems, whilst exports of food from Ukraine are assumed to decline steeply. In this scenario, prices for energy and food commodities are assumed to rise again and remain higher than in the baseline scenario over the projection horizon. All of these factors contribute to a significant increase in macroeconomic uncertainty and financial market volatility compared with the baseline scenario.2

Looking at the supply of gas in Germany, from December 2022 onwards the combination of unfavourable developments on the supply and demand sides leads to a more tense supply situation than in the baseline scenario. By mid-2023, cuts in gas consumption will be only half the size of those in the baseline scenario.<sup>3</sup> Furthermore, for the months from December 2022 to March 2023 as well as from December 2023 to March 2024, temperature-related additional

## Major assumptions in the adverse scenario

Percentage deviations from baseline scenario<sup>1</sup>

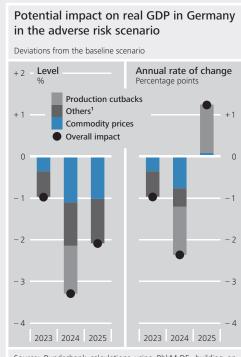

Item	2023	2024	2025
Commodity prices Crude oil Natural gas Food	41.9 99.4 12.4	15.4 104.3 11.2	1.1 85.3 6.0
German exporters' sales markets	- 1.3	- 2.7	- 2.6

Deutsche Bundesbank

consumption is assumed to be 8% compared with the previous winter periods. In the adverse risk scenario, the expansion of supply through deliveries of liquefied natural gas (LNG) in 2023 is two-fifths smaller than in the baseline scenario – for example, owing to delays in expanding Germany's

- 1 The adverse risk scenario applies assumptions based on those employed by ECB staff in a euro area downside scenario; see European Central Bank (2022). In addition, however, it also takes account of developments specific to Germany, including in relation to natural gas supply and demand. For the euro area aggregate, the macroeconomic impact for the euro area was calculated directly by ECB staff. The results for Germany presented in this box are derived from Bundesbank estimates. They were not incorporated into the ECB staff's results for the euro area and therefore did not form part of the Eurosystem's Broad Macroeconomic Projection Exercise.
- 2 The adverse risk scenario is based on monetary and fiscal policy that is unchanged from the baseline scenario. With regard to fiscal policy in Germany, this means that no additional fiscal measures that go beyond the scope of the automatic stabilisers endogenous to the model are included. The electricity and gas price brake is implemented in the same way as in the baseline scenario.
- **3** Up to and including the second quarter of 2023, the baseline scenario assumes savings of 20% compared with average consumption in the 2018-21 period. After that, they are set at 10% on account of decreasing efforts to reduce consumption. The German gas exports assumed in both the baseline scenario and the adverse risk scenario roughly correspond to the average monthly outflows since the start of the Russian war of aggression against Ukraine. A possible European gas supply compensation mechanism is not explicitly incorporated into the adverse risk scenario.

Source: Bundesbank calculations using BbkM-DE, building on the ECB staff's assumptions regarding the international environment and including information from SVAR model and analysis of rationing effects. 1 Encompasses foreign demand and foreign competitors' prices, uncertainty, lending rates and the equity market.

Deutsche Bundesbank

LNG capacity or to underutilisation of LNG terminals.<sup>4</sup> It is also assumed that gas storage facilities will be filled to a minimum of 15%, e.g. as an emergency reserve to ensure a continuous supply of gas to critical infrastructures, or because of technical and geological restrictions. Natural gas is thus rationed if the storage level falls below this limit. Given these assumptions, a gas gap of 12 terawatt hours (TWh) is calculated for 2023. As gas storage facilities are not entirely full again in the summer of 2023, the

## Comparison of baseline and adverse scenarios – December 2022 projection

HICP Baseline scenario Adverse scenario	7.2 8.5	4.1 5.4	2.8 3.1

Deutsche Bundesbank

gas gap expands to 121 TWh in 2024. This corresponds to around 1% and 13%, respectively, of the assumed demand for gas in 2023 and 2024.<sup>5</sup> By contrast, there is no further shortage of gas in 2025, particularly given the assumed increase in imports and higher utilisation of LNG capacity from the summer of 2024 onwards.

The impact of the gas shortages on the real economy in 2023 and 2024 is estimated on the basis of a production function with constant elasticity of substitution.<sup>6</sup> This approach allows a certain degree of substitution between gas and the other input factors of the production function, thus taking account of the experience that enterprises will have gained in dealing with a gas shortage. A negligible effect on gross domestic product (GDP) is identified for 2023 owing

4 The supply increases in the baseline scenario of around 8% in 2023 and 23% in 2024 compared with the average imports since 31 August are based on the data in Federal Network Agency (2022), Deutscher Bundestag (2022) and Tagesschau (2022). For information on possible bottlenecks in the global market for LNG next year, see International Energy Agency (2022b).

**5** By contrast, in the adverse risk scenario developed for the June 2022 macroeconomic projection, the gas gap was particularly pronounced in 2023; see Deutsche Bundesbank (2022b). This was due to the assumption that Russian gas deliveries would come to a complete halt as early as July of this year and that additional imports from other countries would be very limited. In actual fact, however, Russia continued to supply Germany with gas up to the end of August, and imports from other countries were expanded much more strongly than assumed in the June adverse risk scenario. In addition, German gas exports to neighbouring countries have declined steeply in recent months and consumption has been much lower than in previous years, partly because of favourable weather conditions. As a result, gas storage facilities were completely full by November of this year.

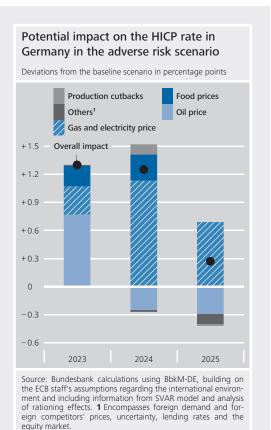

6 This follows the ECB staff's approach to scenario calculations for the euro area. In addition to the elasticity of substitution, the size of the gas gap and the share of natural gas in Germany's gross national expenditure are key variables. For a similar approach, see also Bachmann et al. (2022). Cascade effects along the value chain are not considered. However, given that the gas gap arises with a significant time lag, these effects should play a more minor role anyway: by the first quarter of 2024, many enterprises are likely to have taken steps to dampen the effects of gas rationing along value chains.

to the fairly small gas gap. However, the rationing effect, taken in isolation, will dampen GDP considerably more strongly in 2024, by just over 1%.

If the assumptions about the international setting of the German economy are incorporated into the simulation calculations, the overall year-on-year decline in real GDP in 2023, at around 11/2%, is significantly larger than in the baseline scenario.<sup>7</sup> This is due primarily to the slump in German exporters' sales markets and, in part, to heightened uncertainty. Moreover, economic growth is also held back by higher commodity prices, although this effect is significantly dampened by the electricity and gas price brake. The same is true of the impact on the inflation rate. Nevertheless, the rise in consumer prices in 2023, at around 81/2%, is more than 1 percentage point higher than in the baseline scenario.

The negative impact of the adverse risk scenario is most pronounced in 2024. Instead of growing significantly again as it does in the baseline scenario, the German economy then shrinks for the second year in a row – by <sup>3</sup>/<sub>4</sub>% on the year. As the electricity and gas price brake comes to an end in the course of 2024, there is a rebound effect which more than offsets the dampening impact of falling crude oil prices on inflation. This rebound effect is markedly stronger still than in the baseline scenario (see the table on p. 35). The inflation rate in 2024, at close to 5½%, is therefore well above the figure in the baseline scenario.

It is not until 2025 that the German economy recovers in the adverse risk scenario, too – thanks to the absence of rationing in the winter of 2024-25 and easing commodity price pressures. Real GDP grows by 2¾% on the year, and thus much more strongly than in the baseline scenario. Nevertheless,

real GDP is thus only slightly above its starting level in the third quarter of 2022. The inflation rate, at just above 3%, still exceeds the baseline projection for 2025 by threetenths of a percentage point.

Deutsche Bundesbank

**<sup>7</sup>** As in this year's June projection, the Bundesbank's macroeconometric model (BbkM-DE) is used for the simulation calculations; see Deutsche Bundesbank (2022b). For details on BbkM-DE, see Haertel et al. (2022).

through a larger portion of any price decreases to their end customers. Inflation rates would then fall much more quickly.

There are further downside risks in Germany with regard to the housing market. Should residential real estate prices fall to a greater extent, construction activity is likely to slow down even more quickly and housing investment could decline more sharply than previously assumed. In addition, there would be risks to the financial system, which could, in a worst-case scenario, have feedback effects on the real economy. One consequence would be that the value of collateral used to secure real estate loans would fall, meaning that, in the event of future credit defaults, lenders would suffer higher losses.<sup>20</sup>

Falling real estate prices pose a downside risk in Germany

There is also uncertainty in Germany as to the degree to which the "demand buffers" formed since the outbreak of the pandemic will stabilise. These exist for households in the form of savings built up involuntarily during the pandemic, and for industrial enterprises in the form of an order backlog owing to supply bottlenecks. In the projection, both factors will counteract, to a certain extent, the headwinds from the high inflation and weakening foreign demand. If households' saving ratio were to fall more sharply than expected, private consumption would decline to a lesser degree. Moreover, the temporary boost expected in the export projection from reducing the order backlog could be even stronger. Both would bolster economic activity.21 At least in the case of the former, however, price pressures would also continue to increase at the same time.

Chance of more favourable developments in Germany with a greater impact from the buffers coming from industrial order backlog and coronavirus savings

Looking at the inflation forecast, there are uncertainties arising from the high inflation dynamics themselves. For example, strong wage growth, which is partly attributable to second-

<sup>20</sup> See Deutsche Bundesbank (2022g).

<sup>21</sup> These factors could play a role even in the short term. Specifically, some economic indicators not published until after the projection was finalised suggest that the decline in GDP in the current quarter may be somewhat weaker than projected.

round effects of the high inflation, has already been baked into the projection. However, inflation compensation bonuses have become a relatively important part of recent wage settlements and will reduce the permanent component of wage growth. The wage forecast assumes that, once the period in which the one-off payments subsidised by the government comes to an end, the wage increases agreed will be so large that there will be no major setback to the wage level in the sectors concerned. Should such a setback occur nevertheless, wage growth and the resulting price pres-

sure would be noticeably lower in 2025. However, given the persistently high inflation rates and rising inflation expectations, wages could also go up even more than projected. This would then lead to stronger price increases. As things currently stand, this upside risk is likely to predominate. In such an environment, enterprises could also increasingly try to expand their profit margins. This would drive prices up even further. Overall, inflation rates could then remain at high levels for an extended period of time.

# Rise in energy prices, the exchange rate of the euro and Germany's price competitiveness

Energy prices have risen sharply in 2021 and this year, but especially since the Russian war of aggression against Ukraine. For Germany, the price increase this has caused is particularly pronounced compared with many of its trading partners. At the same time, the euro has depreciated significantly against the US dollar in the year to date. This article examines the impact on Germany's price competitiveness of, first, the relative rise in costs and, second, the depreciation of the euro in 2022.

Estimation results show that the uncertain energy supply situation has itself contributed to the observed depreciation of the euro against the US dollar. However, it is just one of many causes of the depreciation. The swifter tightening of US monetary policy relative to that of the euro area probably played a more important role in the euro's decline. In purely arithmetical terms, the relative rise in energy costs in Germany from the start of the year to September 2022 — a period in which this rise was particularly pronounced — caused Germany's price competitiveness to deteriorate by 0.9%. By contrast, the euro's losses against the US dollar improved price competitiveness by around 1.9% in this period, all other things being equal. This rough calculation illustrates why common indicators of price competitiveness still show it to be fairly favourable for Germany and to have hardly changed since the end of 2021.

However, when interpreting these indicators, it should be noted that price competitiveness is a macroeconomic concept that does not reflect heterogeneities, effects on individual sectors and firms, or distributional effects. Firms for which energy makes up a large proportion of total costs will, for example, inevitably be more affected by the rise in energy prices than is reflected in the macroeconomic indicator of price competitiveness.

### Introduction

Rise in energy prices and depreciation of the euro having an impact on price competitiveness Over the past two years, energy prices have risen sharply worldwide. In addition to the economic recovery following the pandemicinduced downturn, this has been driven first and foremost by shortages in Russian gas supplies and Russia's war of aggression against Ukraine. Compared with other industrial countries, the rise in energy costs has been particularly sharp in Germany in the year to date. Taken in isolation, such a relative increase in costs reduces a country's price competitiveness. At the same time, the euro has depreciated noticeably against the US dollar in the year to date. In US dollar terms, goods exports from Germany therefore became cheaper and thus more competitive.

These considerations raise two questions: to what extent is the observed nominal depreciation of the euro against the US dollar itself related to developments in the energy markets? And what effects on Germany's price competitiveness are the result of the rise in energy prices, on the one hand, and the euro's depreciation, on the other?

## Uncertainty about the energy supply in the euro area and depreciation of the euro

One of the main reasons for the comparatively sharp rise in energy costs in the euro area is that many Member States previously relied heavily on Russian gas supplies. Even before the attack on Ukraine, Russia had reduced the supply of gas. After the start of the war, Russia further restricted supply, and those countries previously heavily dependent on Russian gas supplies had to obtain gas from other countries. This sent gas prices worldwide, but especially in the euro area, sharply higher.<sup>1</sup>

Euro area energy price increase in the wake of the Russian war against Ukraine ...

Germany, like other European countries, thus had to spend a larger proportion of its economic output on energy imports. At the same time, the uncertain supply situation fuelled fears of a marked economic slowdown in the euro area.<sup>2</sup> According to economic theory, these developments should weigh on the external value of the euro, particularly against the US dollar, as the United States is not hit as hard by the impact of the war and is a net exporter of energy. In addition, demand for US dollar assets is often higher in uncertain times, which is another reason why the US currency is appreciating. The depreciation of the euro could therefore have been driven largely by developments in energy prices.

... weighing on the euro, on balance

Bundesbank estimates based on vector autoregressive (VAR) models do, indeed, suggest that higher uncertainty about the supply of gas leads to a nominal depreciation of the euro against the US dollar (see the box on pp. 48 f.). It is not, however, the main reason for the depreciation seen since the beginning of 2022 – of, on balance, 6.8%³ and at times more than 15%. The bulk of the depreciation against the

The bulk of the euro's depreciation against the US dollar in 2022 is probably less a result of the energy crisis ...

- 1 See Deutsche Bundesbank (2022a). An increase in the gas price can, through substitution effects, also impact the prices of other energy sources and, via the merit order principle, drive up the price of electricity in particular; see German Council of Economic Experts (2022).
- 2 See Deutsche Bundesbank (2022b).
- 3 Current as at 9 December 2022.

... than of the relative pace of monetary policy tightening in the two currency areas US currency can consequently be attributed to other factors. These include, in particular, the Federal Reserve's monetary policy tightening: the faster rise in interest rates across the entire maturity spectrum there compared with the euro area made portfolio reallocations to the United States comparatively attractive and thereby exerted downward pressure on the euro.

## International price competitiveness: indicators and current assessment

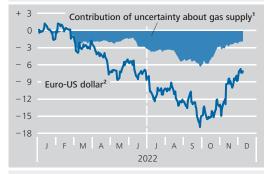

Euro depreciation should, all other things being equal, increase Germany's price competitiveness Irrespective of what has caused the euro's depreciation against the US dollar, the question is: to what extent has it contributed to improving Germany's price competitiveness? Nominal depreciation makes imports more expensive in the domestic currency and renders foreign currency exports cheaper, and should therefore cause a shift in demand for goods towards those produced domestically. However, Germany's price competitiveness is driven not only by the exchange rate against the US dollar, but also by the exchange rate against Germany's other major trading partners and, in particular, by the relative development of prices and costs at home and abroad.

Indicator of price competitiveness based on long-term averages ...

The Bundesbank mainly uses two indicators to assess international price competitiveness.4 First, it tracks an indicator in which the current value of a real effective exchange rate is compared with its long-term average.<sup>5</sup> In addition to the nominal effective exchange rate, the real effective exchange rate used here also includes the deflator of total sales at home and abroad. It has the advantage of taking into account not only domestic value added but also the prices of imported goods and services, which represent a cost component of domestic production where intermediate goods are imported. Moreover, real exports can be forecast better on the basis of broadly defined price and cost indicators, such as the deflators of total sales, than using narrowly defined ones.6

## Historical decomposition of the euro-US dollar exchange rate in the year to date

Daily data, percentage change versus 31 December 2021

1 (Median) contributions of an uncertainty shock relating to European gas supply to the rate of change in the euro's exchange rate against the US dollar in a proxy VAR model. 2 Values in % as the difference between logarithmic values. An increase indicates an appreciation of the euro.

Deutsche Bundesbank

The chart on p. 50 shows the development of this indicator for Germany compared with 26 selected industrial countries since 1975. Two key conclusions can be drawn from its course. First, Germany's price competitiveness can currently still be regarded as fairly favourable by historical standards. Second, as compared with the final quarter of 2021, it has hardly changed overall despite the (relative) rise in energy prices. The reason why price competitiveness as measured by this indicator has so far not deteriorated despite an increase in aggregate relative prices is the euro's nominal performance, which has seen the single currency lose around 1.6% of its value in trade-weighted terms from Germany's perspective since the last quarter of 2021.7

... broadly unchanged on balance since the beginning of the year

- 4 See Deutsche Bundesbank (2013) for a detailed overview of the various approaches and their respective pros and
- **5** According to the relative purchasing power parity theory, nominal exchange rate movements balance out relative inflation differentials over the long term. This implies that the real effective exchange rate would have to fluctuate around a constant mean.
- 6 See Fischer et al. (2018).
- 7 The exchange rate movements against the currencies of industrial countries which are part of the above group of countries but do not belong to the euro area are considered here. In some cases, the above-mentioned aggregate relative price increase will already reflect the fact that the relative increase in energy prices in Germany vis-à-vis its partner countries is passed on as a relative increase in the prices of other products.

## Uncertainty about European energy supply and the external value of the euro in a proxy VAR model

A large number of factors influence financial market variables like the exchange rate of the euro against the US dollar. The following analysis uses a structural vector autoregressive (SVAR) model to identify and isolate one of these determinants: uncertainty about the future supply of Russian gas to Europe.

A VAR model consists of n variables that interact with one another over time. Expressed mathematically, the reduced form of the model to be estimated using data is

$$y_t = c + B_1 y_{t-1} + B_2 y_{t-2} + ... + B_p y_{t-p} + u_{t}$$

where y and c are  $(n \times 1)$  vectors of the endogenous model variables and constants, respectively, and p is the number of lags included. The  $(n \times n)$  matrices  $B_i$  (where  $i=1,\ldots,p$ ) contain the estimated regression coefficients, which indicate how the variables are dependent on one another over time. Finally,  $u_i$  represents an  $(n \times 1)$  vector of errors terms.

A total of seven variables are included in the estimation of the model under consideration here in order to capture developments in the financial markets as comprehensively as possible: the European gas price (Dutch TTF natural gas) as a spot price and one-month future, the Brent crude oil price, the Euro STOXX 50 index, the VIX (a measure of implied stock market volatility derived from option prices), the yields on ten-year German government bonds and, finally, the euro-US dollar exchange rate.1 The reduced form of the model shown above is estimated using Bayesian methods based on daily data from the start of April 2020 to mid-December 2022.2

The resulting model residuals  $\hat{u}_t$  are deviations of the observed data from the values predicted by the model. In terms of the model, the residuals therefore represent surprising changes in the individual variables. In the model residuals, the underlying driving forces are mixed, meaning the model residuals themselves are correlated. In order to be able to make statements about the explanatory contribution of individual influencing factors, it is assumed in the context of SVARs that the residuals can be broken down into mutually uncorrelated impulses – referred to as structural shocks – permitting a causal interpretation. Proxy VAR models, for example, draw on information from outside the model itself in the form of instrumental variables for this purpose.3 A suitable instrument would be correlated with the shock to be identified - here increased uncertainty regarding energy supply – but not with other potential structural shocks.

In the case at hand, an indicator variable (i.e. a time series consisting of only zeros and ones) is used as an instrument. To this

<sup>1</sup> All of the variables except for yields are included in the model in logarithmic form.

<sup>2</sup> The financial markets experienced sharp price declines in March 2020 with the onset of the COVID-19 pandemic. The estimation period has been chosen so as to deliberately exclude this exceptionally volatile period. The number of lags is set to  $\,p=\,5$ , which is equivalent to one week for data available on trading days. However, this specific choice has hardly any impact on the results. Bayesian methods are often used in the literature to estimate VAR models. In this context, certain assumptions are made about the coefficients (priors). The actual estimated coefficients are then derived from a combination of the priors with information derived from the data. If, alternatively (as in classical frequentist statistics) only data are used for the estimation, the results presented here change only marginally.

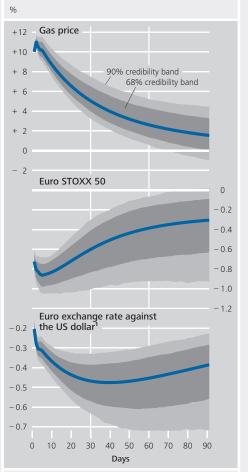

**<sup>3</sup>** See Stock and Watson (2012) and Mertens and Ravn (2013).

end, various events are identified which could be plausibly interpreted as actual or perceived exogenous changes in the supply situation and which should have led to an immediate increase in the price of gas. These include, in particular, Russian announcements concerning limitation or discontinuation of gas supplies.<sup>4</sup> The events generally increased uncertainty about whether the necessary gas supply for euro area consumers would be safeguarded going forward.

Once the shock is identified using the instrument, impulse response functions can be calculated. These show how the shock affects the individual variables in the system over time. The adjacent chart shows the effect of an increase in uncertainty about gas supply which increases the price of gas by 10%. A shock of this kind directly reduces the market valuation of European equities by around 0.7% and leads to a persistent depreciation of the euro against the US dollar of between 0.4% and 0.5%.

Finally, the model can be used to estimate the extent to which the historical development of individual variables can be attributed to the identified shock. The chart on p. 47 shows that uncertainty about energy supply at the beginning of the war was the main reason for the short-term depreciation of the euro at that time, but also that the impact of the shock subsequently lessened again for some time. At the beginning of the summer months, supply uncertainty gradually increased again, but even in late summer it accounted for no more than around one-third of the euro's depreciation.<sup>5</sup>

## Impulse response functions to increased uncertainty about European gas supply\*

\*Response in the proxy VAR model to an uncertainty shock which increases the gas price (wholesale spot price, Dutch TTF) by 10%. Values in % as the difference between logarithmic values. 1 An increase indicates an appreciation of the euro.

Deutsche Bundesbank

4 The events are: 7 March 2022 (Russia threatens to halt gas supply via Nord Stream 1), 23 March 2022 (Russia requires Russian gas to be paid in Russian roubles in future), 14 June 2022 (Russia announces that it will cut gas supply via Nord Stream 1 by 40%), 26 July 2022 (Russia announces that it will cut gas supply via Nord Stream 1 to 20%), 22 August 2022 (Russia announces an unscheduled temporary closure of Nord Stream 1 for maintenance, fuelling fears of a delivery stoppage), 5 September 2022 (Russia ends gas supply via Nord Stream 1 for an indefinite period), 27 September 2022 (suspected sabotage of Nord Stream pipelines). On each of these dates, the European gas price rose by more than 10% compared to the previous day. To construct the instrument, these identified dates are assigned a value of 1, while all other dates are assigned a value of 0.

**5** Estimates based on other structural models tend to suggest even smaller contributions.

Average since 1975 = 100, quarterly data, log scale, inverted scale<sup>1</sup>

\* Based on the deflators of total sales. Group of countries: Austria, Belgium, Cyprus (from 2008), Denmark, Estonia (from 2011), Finland, France, Greece (from 2001), Ireland, Italy, Latvia (from 2014), Lithuania (from 2015), Luxembourg, Malta (from 2008), the Netherlands, Portugal, Slovakia (from 2009), Slovenia (from 2007), Spain, Sweden, the UK, Norway, Switzerland, Japan, Canada and the United States. 1 Rise in the curve (decline in values) indicates an increase in competitiveness. • = Last data point: 9 December 2022. Deutsche Bundesbank

Indicator based on the productivity approach suggests that Germany is in a favourable competitive position A second indicator of price competitiveness which is frequently used at the Bundesbank is based on the productivity approach.8 This indicator is particularly suitable when assessing price competitiveness against a broad group of countries that also includes emerging market economies which are in the process of catching up. To calculate indicators based on the productivity approach, real exchange rates are adjusted for productivity effects using econometric estimates.9 The approach consequently takes account of the fact that a higher relative price level is not accompanied by a loss of competitiveness if it is due to an increased relative productivity level. The Bundesbank calculates such an indicator of the German economy's price competitiveness compared with a broad group of currently 56 partner countries. This indicator, too, at present suggests a favourable competitive position.

Indicators not distorted by high inflation rates One might now ask whether the indicators of price competitiveness described here are distorted by the sharp rise in energy prices or, more generally, by the high inflation rates. This could be the case, in particular, because daily values are derived from real exchange rates, which are only available at a quarterly or annual frequency, by extrapolation using nominal effective exchange rates available at a daily frequency. Since such an extrapolation does not

take into account relative price developments, very different inflation rates could, in principle, lead to a distortion of the indicators. However, rough calculations show that such distortions are also currently still very small and do not change the general finding that Germany's competitive position is fairly favourable at present.<sup>10</sup>

8 The problem with competitiveness indicators based solely on real effective exchange rates is that they result in a distorted representation of international price competitiveness when there are diverging productivity developments at home and abroad and associated Balassa-Samuelson effects occur. According to the Balassa-Samuelson model, productivity gains in the tradable goods sector are accompanied by corresponding wage increases not only in this sector itself, but also in the non-tradable goods sector. This results in an increase in prices in the domestic sector, a rise in the aggregate inflation rate and real currency appreciation. However, this does not reflect deteriorated competitiveness, as the export sector is not affected by the price increase. See Deutsche Bundesbank (2002), Balassa (1964) and Samuelson (1964).

9 See Fischer and Hossfeld (2014).

10 The price differential between Germany and the weighted average of its trading partners based on consumer price indices can provide an indication of the extent of the distortion. For example, from the second quarter of 2022 through to the quarter for which the data needed to calculate the productivity proxy are available, consumer prices in Germany have risen by roughly the same magnitude as the average of the partner countries. This suggests that, at present, the extrapolation does not significantly distort the indicator.

## Rise in energy costs and price competitiveness: a rough calculation

Relative rise in energy costs in Germany in 2022, ...

How are the relative rise in energy prices in Germany, on the one hand, and the nominal depreciation of the euro against the US dollar, on the other, now being reflected in the price competitiveness indicators described above? If we first look at the impact of the rise in energy costs on price competitiveness, we need to determine the extent to which this leads to an increase in aggregate prices relative to other countries.

... taking energy intensity into account, ...

It should be borne in mind that energy costs account for only part of production costs, meaning that the response of the deflator in question will be disproportionately small even if the costs are passed on in their entirety. The lower the energy cost share, the smaller the effect on the aggregate price level. Using inputoutput tables, the share of energy costs in total costs for Germany can be roughly estimated at a little over 2%.<sup>11</sup>

... led to a deterioration in Germany's price competitiveness of around 0.9% by September The actual increase in relative energy costs can be assessed, for example, using an energy-specific producer price index published by the Organisation for Economic Co-operation and Development (OECD) for industrial economies. 12 For Germany, this index rose by just under 30% from the beginning of the year to September relative to a trade-weighted average of 24 partner countries. 13 Taking the energy cost share calculated above of a little over 2% as the basis, the relative increase in said energy costs is reflected in a deterioration of 0.9% in Germany's aggregate price competitiveness. 14

By contrast, domestic competitiveness improved by 1.9% in the same period due to euro depreciation against US dollar This deterioration was counteracted by the euro's depreciation against the US dollar over the course of the year, which, when taken in isolation, improved Germany's price competitiveness. <sup>15</sup> If we consider a group of 26 of Germany's trading partners in broad analogy to the OECD energy-specific producer price index used above, the trade weight of the United

States amounts to just under 15%.<sup>16</sup> The euro's nominal depreciation against the US dollar of 12.5% observed between January and September thus results in an improvement of 1.9% in Germany's price competitiveness compared with the group of countries under analysis.<sup>17</sup>

The improvement in Germany's price competitiveness as a result of the euro's nominal depreciation against the US dollar in the period under review from January to September was thus markedly larger in purely arithmetical terms than its deterioration as a result of the relative rise in energy prices in Germany as measured by the OECD's energy-specific producer price index.<sup>18</sup> Similarly, based on the

- 11 The input-output tables of 2019 serve as the basis for this estimate. If an aggregate energy component is defined in simplified terms as consisting of intermediate inputs of different categories of goods, the share of the corresponding expenditure in total costs ("production value") is 21/4%. Relative to gross value added, this would be around 41/2%. 12 See also the chart on p. 46.
- 13 According to this index, the rise in energy costs between January (before the start of the war) and September amounted to 77% for Germany and 36% for the weighted average of partner countries. Energy prices in Germany thus rose by just under 30% relative to these trading partners. In October, however, energy prices in Germany fell again.
- 14 For the sake of simplicity, this rough calculation assumes that energy costs as a share of total costs do not differ significantly between the partner countries and Germany. If, for example, it were only 1% in the partner countries, Germany's price competitiveness would have deteriorated by 1.4%. If energy intensity abroad were higher at 3%, the deterioration would only amount to 0.6%. In addition, for the sake of simplicity it is assumed that country-specific energy prices do not differ in terms of their starting level.
- 15 The following analyses therefore assume, for the sake of simplicity, that the euro's exchange rate against the currencies of all other trading partners has not changed. In reality, the external value of the euro increased slightly in trade-weighted terms over the period under review if the depreciation against the US dollar is excluded.
- 16 See Deutsche Bundesbank (2020). Among the 26 trading partners considered here, Japan and Canada were not included in the calculation of the relative increase in energy costs in Germany compared with 24 countries owing to a lack of data.
- 17 To harmonise the calculation of the depreciation with the relative increase in energy prices calculated above, the change in monthly averages of the euro-US dollar exchange rate between January and September 2022 was used.
- **18** It should be noted that a rough calculation of this kind is highly simplified. For example, no second-round effects of the rise in energy prices on other cost components are taken into account, and adjustment effects such as a substitution of energy sources in production or in the demand for final products are also disregarded, as are international differences in the starting level of energy costs.

aforementioned group of 26 trading partners, in purely arithmetical terms a 1% nominal depreciation of the euro against the US dollar would improve Germany's price competitiveness to around the same extent as – in purely hypothetical terms – its price competitiveness would deteriorate owing to a 6% increase in relative energy costs against these countries.<sup>19</sup>

sources — are often themselves invoiced in US dollars.<sup>22</sup> A depreciation of the euro against the US dollar is therefore itself likely to have a pricedriving effect on energy costs. If, in an extreme case, all intermediate goods are invoiced in US dollars, but export revenues come from a third currency area and are denominated in euro, the profit of an affected firm would not increase as a result of the euro's depreciation, but would actually decrease further.

Depreciation against the US dollar can have a price-driving effect

## Classification: price competitiveness as a macro-economic concept

Price competitiveness as a macroeconomic concept

How can we now assess the finding that Germany's price competitiveness is currently fairly favourable according to our indicators, given the fears voiced by many that the rise in energy prices poses enormous challenges to parts of Germany's industrial base? To answer this guestion, it should first be borne in mind that the exchange rate is a macroeconomic variable and that the price competitiveness indicators based on it are therefore necessarily a macroeconomic concept as well. Such a concept does not capture heterogeneities, the effects on individual sectors and firms or the distributional effects between them. For example, if one particular sector has a distinctly higher energy cost share than the average of the economy as a whole, it will be more strongly affected by the relatively pronounced rise in energy prices in Germany. In addition, a depreciation of the euro against the US dollar alone does not necessarily reduce the price of exports with sales markets located in currency areas other than the United States.<sup>20</sup> Exporters to the United Kingdom and Japan, for example, have been particularly affected, with their exports invoiced in euro even becoming more expensive owing to the depreciation of the pound and the yen against the euro over the period under review. By contrast, exporters to the United States with a low energy cost share benefited all the more from the depreciation against the US dollar.<sup>21</sup>

Moreover, it should be borne in mind that intermediate goods – especially a number of energy

Germany's currently fairly favourable price competitiveness despite the relative rise in energy costs should therefore be interpreted in macroeconomic terms. The result certainly does not mean that, just because of the euro's depreciation against the US dollar, the rise in energy prices is unproblematic for all domestic sectors or firms. Rather, exchange rate movements by their very nature as macroeconomic variables affect different sectors or firms in different ways.

Finally, as described here, the depreciation of the euro against the US dollar should not be seen primarily as a response to the energy crisis itself. Instead, it is largely due to other circumstances, such as the relatively strong tightening of US monetary policy. If these circumstances prove to be temporary,<sup>23</sup> the exchange rate ef-

Euro depreciation may be temporary

- **19** This result is approximated by  $(1/(21\%))^*14.6\% \approx 6.5$ . If a broader group of 56 partner countries is considered, the US dollar would have a weight of just over 9%, which would result in a value of  $(1/(21\%))^*9.4\% \approx 4.2$ .
- 20 In such a scenario, exporters can still benefit from a depreciation of the euro against the US dollar if exports are invoiced in US dollars. This is actually the case for many goods in global trade, even when the United States is not one of the two trading partners (see Gopinath (2015) and Gopinath and Itskhoki, (2021)). In such a case, exporters' profit margins would rise if viewed in isolation, provided intermediate goods and other cost components are not also invoiced in US dollars. If exporters subsequently lowered their prices, demand effects would also arise.
- **21** A demand effect results directly if exports are invoiced in euro and thus become cheaper for US importers. If export goods are invoiced in US dollars, exporters' profit margins increase, all other things being equal.
- 22 However, this does not necessarily apply to trade in natural gas, for which contracts are often invoiced in euro, at least in Europe.
- 23 For example, the euro has already appreciated again against the US dollar since the period up to September considered in the calculation.

53

fect improving price competitiveness would also disappear in the future. This would then worsen Germany's price competitiveness if the sharp rise in energy costs compared with other countries were to also prove persistent at the same time. In this respect, therefore, it cannot be assumed that relative price shifts emanating from the energy market, which may be structural in nature, will always and permanently be absorbed by nominal exchange rate changes.

## Access to cash in Germany – results of a representative public survey

For the German public to be able to use cash, there needs to be a nationwide and cost-effective network of cash dispensers. At the end of 2021, the Bundesbank investigated the state of this coverage as part of a representative public survey. The analysis considers three questions. What is the outlay in terms of monetary cost, time and effort involved in withdrawing cash from an automated teller machine (ATM)? Does provision fall short when it comes to people from rural areas or vulnerable groups? And what is the relationship between the individual outlay associated with withdrawing cash and the use of cash as a means of payment? This provides insights into whether people in Germany are able to pay by cash or cashless means of payment according to their preferences or whether their choice is indirectly impaired by a lack of options for making cash withdrawals.

The empirical analysis shows that, at present, it is very easy for the German population to access cash. Overall, 94% of respondents say they need to exert little or very little effort to get to an ATM. The average time required per withdrawal is approximately nine minutes. Vulnerable groups report needing somewhat longer. However, they, too, consider the effort involved to be low. There is no evidence that rural areas specifically are undersupplied with cash.

A regression analysis does not reveal any statistically significant relationship between the individual outlay for withdrawing cash and payment behaviour. ATM coverage therefore appears to be good enough to allow consumers to pay in cash as and when they wish. In a hypothetical context, however, many respondents state that they would be increasingly inclined to move away from cash if provision were to deteriorate significantly. There would then be the danger of a downward spiral of reduced cash infrastructure and falling cash usage. Lower cash use entails rising cost pressures for private sector players in the cash cycle, such as cash-in-transit (CIT) companies and commercial banks. This could cause the existing cash infrastructure to be scaled back in the medium or long term, which in turn would adversely affect cash usage.

#### Introduction

Cash has advantages for the individual ...

Changing preferences and new developments in the payments space mean that more and more purchases are being paid for by card or smartphone instead of in cash. This trend was amplified by the COVID-19 pandemic. Nevertheless, cash remains a highly popular means of payment. According to a representative Bundesbank survey, 58% (2017: 74%) of day-to-day payments are still made using cash. The general public like that cash protects privacy, provides a clear overview of spending and means you can rely on the fact that the payment transaction has been properly settled.<sup>1</sup>

... and is of social importance

Of at least equal importance with the benefits of cash for the individual is its meaning for society as a whole. As the only physical payment instrument, cash can be used without intermediaries. This means that it remains largely usable even in the event of local power outages or problems with technical infrastructure and it constitutes an important component of crisis preparedness. It should also be borne in mind that some population groups — especially children — are not easily able to utilise cashless means of payment and are reliant on cash.<sup>2</sup>

Nationwide and cost-effective provision are key to unre-

This is why the Bundesbank and the Eurosystem as a whole advocate for freedom of choice between cash and cashless means of payment. The idea is for citizens to be able to decide for themselves whether to pay in cash or use a cashless option. For that to work, there needs to be an unrestricted and cost-effective supply of cash because — unlike in the case of cashless means of payment — cash is "used up" when a payment is made; the consumer always has to source fresh cash for the next time.<sup>3</sup>

Downward spiral: falling demand for cash can lead to erosion of cash infrastructure, and vice versa The inherent risk of a cost-driven downward spiral makes it all the more important to maintain a good cash infrastructure. Alongside the Bundesbank, the business of supplying cash also involves commercial banks and CIT companies, and those stakeholders are subject to economic cost pressures. The provision of cash

is fixed-cost intensive, meaning that when cash use goes down, unit costs go up - as happened recently during the COVID-19 pandemic. This cost pressure could lead to a reduction in the cash infrastructure in place in the future. ATMs that are less frequently used could be taken out of operation as a result, for example. This could be the start of a downward spiral whereby a poorer supply of cash leads to lower use of cash, and vice versa. Those members of the public who wish to carry on using cash or who are reliant on it would be the first to bear the brunt of this. But since cash – as a physical means of payment – also constitutes an important component of crisis preparedness, risks for the security of society as a whole may ensue.4

With this in mind, the Eurosystem keeps a constant eye on developments with regard to the cash infrastructure and, in particular, the availability of ATMs. There are currently around 55,000 ATMs in Germany, which equates to roughly 70 ATMs per 100,000 inhabitants.5 That figure has remained broadly stable over the past ten years. This places Germany in the top quarter of European countries, fundamentally indicating a good state of provision. Alongside the number of ATMs, another factor that is of at least equal importance is how those machines are distributed. They should be present wherever they are needed and be available even in sparsely populated regions. One good way of measuring the extent to which this requirement is met is to look at the distance between the place of residence and the nearest ATM. According to the ECB, in most

Eurosystem uses geographical indicators to monitor developments in cash infrastructure

<sup>1</sup> For detailed information on current payment behaviour in Germany and what happened during the COVID-19 pandemic, see Deutsche Bundesbank (2022a).

**<sup>3</sup>** See https://www.ecb.europa.eu/euro/cash\_strategy/html/index.en.html

<sup>4</sup> For example, the Federal Office of Civil Protection and Disaster Assistance recommends that the public keep a sufficient reserve of cash at home in case of a power outage. See <a href="https://www.bbk.bund.de/EN/Prepare-for-disasters/Recommendations/Electric-power-breakdown/electric-power-breakdown node.html">https://www.bbk.bund.de/EN/Prepare-for-disasters/Recommendations/Electric-power-breakdown/electric-power-breakdown node.html</a>

<sup>5</sup> See Deutsche Bundesbank (2022b).

euro area countries, 95% of the population live no more than five kilometres from their nearest ATM, as the crow flies.6

Survey data show actual outlay involved in withdrawing cash ...

This article fleshes out these geographical analyses for the euro area with findings from a public survey carried out in Germany. Using data from the Bundesbank's 2021 payment behaviour study, the analysis explores three guestions. First, what is the outlay (in terms of time, monetary cost and effort) of withdrawing cash from an ATM? Second, does provision fall short with respect to people from rural areas or vulnerable groups – in other words, people who might be disadvantaged, for example, because of their social status? And, third, what is the relationship between the individual outlay associated with withdrawing cash and the use of cash as a means of payment?

.. and whether freedom to choose between cash and cashless means of payment could be impaired

The results can be used to ascertain how well the population in Germany is actually supplied with cash. They also enable inferences to be made as to whether citizens are able to freely choose between cash and cashless means of payment when making payments or whether proximity to the nearest ATM sometimes makes that decision for them.

## Data basis: the Bundesbank's 2021 payment behaviour study

Study series on payment behaviour in Germany The following analysis is built on data from the "Payment behaviour in Germany" survey. These views and opinions exist as far as cash and other means of payment are concerned.7 The data are representative of the German-speaking population aged 18 and over. The survey period for 2021 ran from 8 September to 5 December. During this time, a total of 5,870 people were randomly selected and interviewed by telephone. In addition, 4,197 of these respondents completed a diary in which they recorded three days' worth of purchases together with the payment method that they used.

The survey shows that cash is currently the most widely used means of payment in Germany, even if its use has declined sharply as a result of the COVID-19 pandemic. 58% of all day-to-day payments are settled in cash, which corresponds to 30% of expenditure in terms of value. In the 2017 survey, these shares stood at 74% and 48%, respectively. The move towards internet shopping and many retailers asking customers during the pandemic to refrain from paying in cash are the main reasons for this decline. Nonetheless, 69% of respondents consider it important to be able to continue using cash in the future.8

Cash has been used less frequently since COVID-19 pandemic, but is still popular

This study drew on a sub-sample of 2,487 people who were asked additional questions about cash withdrawals in the telephone interviews. Information about the amount and frequency of withdrawals as well as the outlay involved is available for these respondents. Together with the records from the payment diaries, this provides a detailed overview of how people in Germany obtain cash and use it to make payments.

Survey contains information about payment and cash withdrawal behaviour

## Cash access points in Germany

are studies undertaken by the Bundesbank every two to three years to examine how consumers in Germany pay and to find out what

many can choose from various options: ATMs, bank counters, and points of sale at retailers that offer cash withdrawals as part of a purchase or via a cash service provider ("cashback" or "cash-in-shop").

People who want to withdraw cash in Ger-

Consumers in Germany can obtain cash at ATMs, bank counters and points of sale

<sup>8</sup> See Deutsche Bundesbank (2022a).

ATMs the most frequently used source for obtaining cash ...

The table on this page outlines the relevance of the various withdrawal sources in Germany; the top section shows general usage while the bottom section focuses on intensity of use. 96% of respondents use ATMs for cash withdrawals, making 81% of their withdrawals there on average. These percentages have hardly changed since the last survey in 2017. This means that ATMs are still by far the most important source for withdrawing cash. By contrast, only 20% (2017: 38%) of respondents now go to a bank counter, where they withdraw on average 11% of the cash they need (2017: 14%). Withdrawals at the point of sale, on the other hand, have become more significant in recent years, with one in three people now making use of this service. Overall, respondents withdraw on average 8% of their cash this way.

... and especially important from a logistical point of view Although a growing number of retailers now allow customers to make withdrawals at the point of sale, this type of cash supply is more of a complementary solution than a fully-fledged alternative to bank-operated ATMs. Withdrawal at the point of sale usually requires the customer to purchase goods at the shop offering the service and is only possible during the shop's opening hours. Moreover, the cash is not checked for authenticity by machine before it is paid out. Lastly, withdrawals at the point of sale are only available if the till contains cash

## Importance of different withdrawal sources\*

%

Item	2017	2021
Share of users	0.5	0.5
ATM	95	96
Bank counter	38	20
Point of sale	23	34
Average share of annual total withdrawals		
ATM	84	81
Bank counter	14	11
Point of sale	2	8

\* Data based on the Bundesbank's 2017 and 2021 payment behaviour studies. Deutsche Bundesbank withdrawn from ATMs or bank counters by customers making cash payments over and above the amount the cashiers need to make change. This article therefore focuses in particular detail on access to the bank-based cash infrastructure, i.e. ATMs and bank counters. These cover most of the everyday need for cash and guarantee that cash can be supplied even if retailers experience technical disruptions or in the event of a crisis (see also the box on pp. 59 f.).

## Outlay involved in withdrawing cash from ATMs and bank counters

How well can the general public access cash? To capture the outlay involved in making with-drawals from ATMs or bank counters, respondents were asked first to describe their usual route there and then to assess the effort required. This may depend, for example, on how long the journey is, what means of transport is used, whether the withdrawal can be combined with other errands and whether fees are charged for the withdrawal.

Outlay involved in obtaining cash has multiple components

The first aspect – the situations in which respondents withdraw cash and the means of transport they use when doing so – are summarised in the table on p. 61. Most people combine cash withdrawals with going shopping (47%) or to work (17%), meaning that the outlay is less of a factor. Only 15% leave home solely to get cash out. In total, when withdrawing cash, 58% of respondents travel by car, 21% on foot, 12% by bicycle and 8% by public transport. The most common scenario involves withdrawing cash while going shopping by car.<sup>10</sup>

How much time does it take respondents to withdraw cash from an ATM or a bank coun-

**9** Cash-in-shop withdrawals do not require any goods to be purchased. However, the person making the withdrawal has to sign an agreement with a cash service provider. **10** As these questions were only asked in the 2021 survey, a comparison cannot be made with previous years.

Most people combine with-drawing cash with other activities

## Increased demand for cash due to card reader disruptions

From the second half of May 2022, Germany experienced frequent disruptions to retail card payments due to a software error affecting a certain type of card payment terminal which is used by many large retail chains. The EHI Retail Institute estimates that around 10% of all terminals in Germany's retail sector were affected by the disruptions. Until the problems were resolved, only cash payments were accepted at the businesses affected.

At the same time, the Bundesbank branches registered unusually large deposits and withdrawals of cash, indicating its increased use in the retail sector. In August, the Bundesbank conducted a public survey in order to shed more light on the causes of the increase in cash turnover and the effects of the disruptions. In the Bundesbank Online Panel – Households (BOP-HH), a representative monthly online survey of several thousand people, respondents reported the extent to which they were affected by the disruptions and what consequences this had for their personal behaviour.

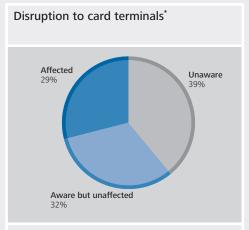

As shown in the adjacent chart, 29% of respondents were personally affected by the disruptions. Moreover, 32% were not affected but had heard about them, whereas 39% were wholly unaware of the problems.

What did the disruption mean for respondents' shopping? Of those affected, 62% had enough cash on them and were able to continue shopping without any problems

(see the upper chart on p. 60). People who had insufficient cash bought less (13%), stopped shopping in order to get cash (15%), or stopped shopping altogether so they could pay by card later or elsewhere (11%).

The results show that the majority of those affected were able to continue shopping unhindered because they had sufficient cash in reserve. According to the Bundesbank's payment behaviour study, people in Germany carry an average of €100 in cash — a fairly high transaction balance compared with other European countries, which actually proved useful when the disruption occurred.²

What did consumers do as a consequence of the incidents, and do they carry more cash on them to be safe? Looking at the group of people who had heard about the disruptions and/or were affected by them, 18% reported carrying more cash in reserve, at least for a short period of time. While 11% always carry more cash, 71% have not made any change to their cash re-

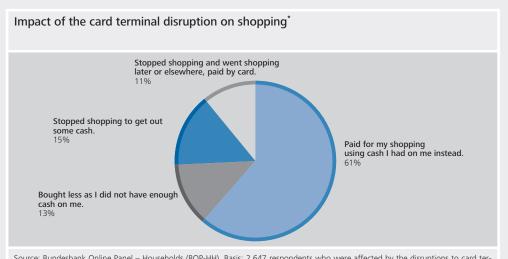

Source: Bundesbank Online Panel – Households (BOP-HH). Basis: all 8,996 respondents. \* Questions: Were you aware of these disruptions? Were you affected by the disruptions when shopping?

Deutsche Bundesbank

serves because of the disruptions (see the lower chart on this page).

The analysis confirms increased demand for cash in connection with the disruptions to card terminals in Germany. Around 75% of those affected made their purchases in cash instead of using a card as planned. This underscores the importance of a nation-wide, bank-operated cash infrastructure in the event of crisis or disruption. Without Germany's broad network of ATMs and bank branches, retailers and consumers would potentially have faced much greater problems.

Three-quarters of respondents need no more than ten minutes to withdraw cash from an ATM or bank counter

ter? Respondents were asked how much time the round trip or the detour took them, and how long it took to make the withdrawal itself. The chart below shows the average time taken and its distribution. On average, it takes respondents nine minutes to get cash. 55% of respondents need no more than five minutes, and 75% no longer than ten minutes. Only 1% need three-quarters of an hour or more. 11

Withdrawal fees are only rarely charged Besides involving a logistical effort, withdrawals can be subject to fees. The top chart on p. 62 shows how often respondents have to pay charges when withdrawing cash. Overall, 82% of respondents report never or only rarely having to pay fees, while a total of 9% say they are charged fees more frequently and as many as 5% pay a fee for every withdrawal.<sup>12</sup>

Satisfaction with access to ATMs is high

The statistics presented so far suggest that the time and monetary outlay involved in withdrawing cash from ATMs or bank counters in Germany is low. But how do the respondents themselves assess their outlay? 94% say it is very or fairly easy to get to an ATM or bank counter (see the bottom chart on p. 62), while only 6% find it fairly or very difficult. In a survey conducted by the ECB in 2019 for the euro area as a whole, 9% of respondents reported that it was very difficult to access cash.<sup>13</sup> The outlay in

## How people get to an ATM or bank counter\*

#### Ease of accees to cash withdrawals\*

\* Data based on the Bundesbank's 2021 payment behaviour study. Question: When you want to withdraw cash from an ATM or the bank, how easy or difficult do you usually find it to get there?

Deutsche Bundesbank

Vulnerable people need longer to withdraw cash, but are equally satisfied What is the provision of cash like for vulnerable groups of people in particular, i.e. people who might be socially disadvantaged owing to their health or social status? In the following, respondents' age and employment status are used as indicators to assign them to this group. A comparison shows that people over the age of 65, those who are unemployed and people unfit for work take on average 3.8 minutes longer to withdraw cash from ATMs than other people. Nevertheless, they consider the outlay involved to be similarly low. This could be because of a certain type of habituation effect as they may also be accustomed to facing challenges in other areas of their lives. By contrast,

they are charged fees somewhat less often, possibly because they make more specific efforts to avoid them and instead accept that they may have to make a longer journey to withdraw cash.

A comparison of the urban and rural population shows that it takes people living in rural regions roughly the same amount of time to withdraw cash from ATMs as people who live in a town or city. They, too, consider the outlay involved to be low. There is thus no evidence that rural areas specifically are undersupplied with cash.14 It is worth noting, however, that people in rural regions are more likely to travel by car when withdrawing cash, mostly in connection with other activities. As a result of poorer local amenities and transport infrastructure, people in rural regions have higher mobility costs overall. However, the additional outlay involved in withdrawing cash does not appear to be a factor in this.

People in rural regions are well supplied with cash, but are reliant on their

## The relationship between the outlay involved in obtaining cash and withdrawal and payment behaviour

Findings collected from the interviews show that, on the whole, the outlay involved in withdrawing cash from ATMs is limited for most people in Germany. All the same, there are some who have further to travel to reach an ATM or who are charged withdrawal fees. Do these individuals adjust their withdrawal behaviour in response to this greater outlay? Or do they go so far as to reduce the amount of cash they use?

According to the classic economic model of Baumol (1952) and Tobin (1956), an increased

**14** A similar study conducted by the Bundesbank in 2017 came to the same conclusion. See Deutsche Bundesbank (2020).

Hypotheses from the economic model outlay per withdrawal (time involved or in the form of fees) lowers withdrawal frequency. Consequently, individuals may choose, for example, to regularly withdraw larger amounts, hold cash in reserve or additionally withdraw cash at the point of sale. But it is also conceivable that they would reduce their demand for cash and (by necessity) use cashless means of payment more frequently. In this case, using cash as a means of payment would be restricted by the high outlay involved in obtaining it.

Linear regression to estimate relationship between withdrawal and payment behaviour, on the one hand, and outlay involved in obtaining cash, on the other

To find answers to these questions, various linear regression models are estimated below in which respondents' withdrawal and payment behaviour (dependent variable) is attributed to the outlay involved in obtaining cash (explanatory variable).15 The dependent variables used to describe withdrawal behaviour are (i) the number of ATM withdrawals per year, (ii) whether a person withdraws cash to keep in reserve and (iii) withdrawals at the point of sale as a share of total annual withdrawals. Dependent variables describing payment behaviour are (iv) the share of cash payments made at shops measured by the number of transactions and (v) by the value of the transactions. Explanatory variables that reflect the outlay involved in obtaining cash are the time involved in making withdrawals and whether a person often pays fees when withdrawing cash. In addition, the models contain numerous socio-demographic control variables. The models describing withdrawal behaviour ((i) to (iii)) also contain the sum withdrawn annually at ATMs, the point of sale and bank counters. In other words, they analyse how individuals adjust their withdrawal behaviour for each type of cash use.

Description of withdrawal and payment behaviour

Descriptive statistics on the variables used can be found in the adjacent table. Looking at withdrawal behaviour, the statistics show that respondents visit ATMs an average of 31 times a year. 43% withdraw cash to keep it in reserve. In addition, 8% of respondents' total withdrawals are made at the point of sale. Looking at payment behaviour, the statistics show that respondents make an average of

<sup>16</sup> The respondents' average cash payment shares provided here denote the average expenditure shares covered by individual respondents using cash. They should not be equated with cash payment shares in the German economy, which refer to cash transactions as a percentage of total transactions (currently 58% in terms of the number of transactions and 30% in terms of turnover; see Deutsche Bundesbank (2022a)).

Deutsche Bundesbank

Regression results: if ATM withdrawals involve a higher outlay, larger amounts are withdrawn to keep in reserve and use is instead made of cashback services, ...

cash are related, while columns (iv) and (v) concern payment behaviour. Statistically significant correlations can be seen with regard to withdrawal behaviour (columns (i) to (iii)). For example, if respondents need five minutes longer to make an ATM withdrawal, they make on average one less trip to the ATM a year (and instead withdraw larger amounts). Furthermore, the probability of cash being kept in reserve after it is withdrawn increases by somewhat more than 1 percentage point, while the share of cash withdrawn at the point of sale goes up by 0.75 percentage point. Individuals who are at least occasionally affected by fees make an average of four fewer withdrawals per year

(and instead withdraw larger amounts). However, fees do not appear to affect whether cash is kept in reserve after it is withdrawn or whether withdrawals are made at the point of sale. Overall, the regression results for withdrawal behaviour are consistent with the economic model.<sup>18</sup>

<sup>17</sup> In a complementary analysis, a number of interaction terms were used to determine whether the means of transport used by respondents plays a role when it comes to the time it takes to travel to an ATM. This was not the case.

18 As a robustness check, in a further estimation of model (i), the share of withdrawals at the point of sale was included as an explanatory variable. This variable can be seen as an additional proxy for payment method preference. The inclusion had hardly any effect on the coefficients of the outlay variables.

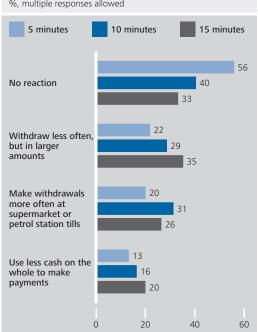

... but payment behaviour remains the same By contrast, looking at payment behaviour (columns (iv) and (v)) reveals no statistically significant correlations with the individual outlay involved in obtaining cash. In the estimated models, the amount of cash used by respondents cannot be explained by the cost of withdrawing it. The regression therefore does not give any indication that cash use might currently be restricted by an excessive outlay involved in obtaining it.

Alternative analysis using hypothetical scenarios In addition to the regression analysis, the empirical relationship between the outlay involved in obtaining cash and withdrawal and payment behaviour can also be approached using hypothetical scenarios. To this end, survey participants were asked the following question: "Assume it took 5 (or 10 or 15) minutes longer than it does now to reach the nearest ATM or bank counter belonging to your bank or savings bank. What would you probably do in this case?" The responses are shown in the adjacent chart.

If options for withdrawing cash worsened, respondents would adjust their withdrawal and payment behaviour

Five extra minutes to reach an ATM would have no impact on 56% of respondents. Still, 42% would adjust their withdrawal behaviour by withdrawing less frequently at ATMs, instead withdrawing larger amounts (22%) and/or withdrawing cash at the point of sale (20%). 13% would even (additionally) change their payment behaviour and use less cash. As the amount of time to reach an ATM increases (10 or 15 extra minutes), even more respondents lean towards adjusting their behaviour. At 15 minutes, only one-third of respondents would withdraw cash and use it to make payments as before. Overall, 61% would adjust their withdrawal strategy and 20% would use less cash. So if the number of ATMs were reduced, many consumers would adjust not only their withdrawal behaviour but also their payment behaviour. These individuals would then be limited in their freedom to choose between cash and cashless means of payment.

## Reaction if the distance to the nearest ATM or bank counter increases\* %, multiple responses allowed

\* Data based on the Bundesbank's 2021 payment behaviour study. Question: Assume it took 5/10/15 minutes longer to reach the nearest ATM or bank counter belonging to your bank or savings bank. What would you probably do in this case?

Deutsche Bundesbank

### Conclusion

Empirical analysis of data from the 2021 payment behaviour study shows that the general public in Germany still has very good access to cash. Overall, 94% of respondents estimate that the outlay involved in making withdrawals at ATMs is either low or very low. The average time required per withdrawal is approximately nine minutes. Vulnerable groups report needing somewhat longer. However, they, too, consider the effort involved to be low. There is no evidence that rural areas specifically are undersupplied with cash.

A regression analysis of the data shows statistically significant correlations between the outlay involved in withdrawals and withdrawal behaviour. The results suggest that those who are currently faced with a higher outlay adjust their withdrawal behaviour in an economically rational manner by withdrawing higher amounts

of cash at ATMs that they then keep in reserve or by withdrawing additional cash at the point of sale. However, the regression does not show any statistically significant correlations between the outlay involved in withdrawals and the use of cash as a means of payment. At the moment, access to cash can be interpreted in such a way that consumers are largely free to choose whether or not to use cash at the point of sale. In other words, the Eurosystem's objective of ensuring the freedom of choice between cash and cashless means of payment does not appear to be impaired at present.

In a hypothetical context, however, many respondents state that they would be increas-

ingly inclined to move away from cash if the supply of cash were to deteriorate significantly. In this scenario, they would be limited in their choice of means of payment. Furthermore, this risks setting in motion a cost-driven downward spiral: if cash usage were to fall, cost pressures would rise for private sector stakeholders in the cash cycle, such as CIT companies and commercial banks. This could cause the existing cash infrastructure to be further scaled back in the medium or long term, which in turn would adversely affect cash usage. In order to prevent such a turn of events in the Eurosystem, it is important to continue statistically recording and evaluating the use and availability of cash.

of paper issued by euro area MFIs. **9** Including national banknotes still in circulation. **10** The German contributions to the Eurosystem's monetary aggregates should on no account be interpreted as national monetary aggregates and are therefore not comparable with the erstwhile German money stocks M1, M2 or M3. **11** The

difference between the volume of euro banknotes actually issued by the Bundesbank and the amount disclosed in accordance with the accounting regime chosen by the Eurosystem (see also footnote 2 on banknote circulation in Table III.2).

euro banknotes put into circulation by the Bundesbank in accordance with the accounting regime chosen by the Eurosystem (see also footnote 2 on banknote circulation in Table III.2). The volume of currency actually put into circulation by the

Bundesbank can be calculated by adding to this total the item "Intra-Eurosystem liability/claim related to banknote issue" (see "Other liability items"). 5 Excluding central governments' deposits. 6 In Germany, only savings deposits.

<sup>\*</sup> Monetary financial institutions (MFIs) comprise banks (including building and loan associations), money market funds, and the European Central Bank and national central banks (the Eurosystem). 1 Source: ECB. 2 In Germany, only savings deposits. 3 Excluding holdings of MFIs; for the German contribution, excluding German MFIs' portfolios of securities issued by MFIs in the euro area. 4 In Germany, bank debt securities with maturities of up to one year are classed as money market paper.

**<sup>5</sup>** Excluding liabilities arising from securities issued. **6** After deduction of inter-MFI participations. **7** The German contributions to the Eurosystem's monetary aggregates should on no account be interpreted as national monetary aggregates and are therefore not comparable with the erstwhile German money stocks M1, M2 or M3. B Including DEM banknotes still in circulation (see also footnote 4 on p. 10\*). **9** For the German contribution, the difference between the volume of euro banknotes

Discrepancies may arise from rounding. \* The banking system's liquidity position is defined as the current account holdings in euro of euro area credit institutions with the Eurosystem. Amounts are derived from the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. 1 Figures are daily average for the reserve maintenance period ending in the month indicated. Following the changeover in the frequency of Governing Council monetary policy meetings to a six-week cycle, a reserve maintenance period no longer ends in every month. No figures

are available in such cases. 2 Source: ECB. 3 Includes liquidity provided under the Eurosystem's asset purchase programmes. 4 From August 2009 includes liquidity absorbed as a result of the Eurosystem's foreign exchange swap operations. 5 From 2002 euro banknotes and other banknotes which have been issued by the national central banks of the Eurosystem and which are still in circulation. In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is

allocated to the ECB on a monthly basis. The counterpart of this adjustment is shown under "Other factors". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly basis, to the NCBs, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to ts paid-up share in the ECB's capital. The difference between the value of the euro banknotes allocated to an NCB and the value of the euro banknotes which that NCB has put into circulation is likewise shown under "Other factors". From 2003 euro

banknotes only. **6** Remaining items in the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. **7** Equal to the difference between the sum of liquidity-pro viding factors and the sum of liquidity-absorbing factors. **8** Calculated as the sum of the "Deposit facility", "Banknotes in circulation" and "Credit institutions' current account balances".

<sup>\*</sup> The consolidated financial statement of the Eurosystem comprises the financial statement of the European Central Bank (ECB) and the financial statements of the national central banks of the euro area Member States (NCBs). The balance sheet items for foreign currency, securities, gold and financial instruments are valued at market

rates at the end of the quarrter. 1 In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is allocated to the ECB on a monthy basis. The counterpart of this adjustment is disclosed as an "Intra-Eurosystem liability related to

		Liabilities to nor residents denon foreign currency	ninated in							
Liabilities to non-euro area residents denominated in euro	Liabilities to euro area residents in foreign currency	Total	Deposits, balances and other liabilities	Liabilities arising from the credit facility under ERM II	Counterpart of special drawing rights allocated by the IMF	Other liabilities 2	Intra- Eurosystem liability related to euro banknote issue 1	Revaluation accounts	Capital and reserves	As at reporting date

euro banknote issue". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on an monthly basis, to the NCBs, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro

banknotes allocated to the NCB according to the aforementioned accounting procedure and the value of euro banknotes put into circulation is also disclosed as an "Intra-Eurosystem claim/liability related to banknote issue". **2** For the Deutsche Bundesbank: including DEM banknotes still in circulation. **3** Source: ECB.

**3** In Germany, debt securities with maturities of up to one year are classed as money market paper; up to the January 2002 Monthly Report they were published together

with money market fund shares. 4 Statistical breaks have been eliminated from the flow figures (see also footnote  $^{\star}$  in Table II.1).

<sup>\*</sup> Assets and liabilities of monetary financial institutions (MFIs) in Germany. The assets and liabilities of foreign branches, of money market funds (which are also classified as MFIs) and of the Bundesbank are not included. For the definitions of the respective items, see the footnotes to Table IV.3. 1 Owing to the Act Modernising Accounting Law (Gesetz zur Modernisierung des Bilanzrechts) of 25 May 2009, derivative financial instruments in the trading portfolio (trading portfolio derivatives) within the meaning of

Section 340e (3) sentence 1 of the German Commercial Code (Handelsgesetzbuch) read in conjunction with Section 35 (1) number 1a of the Credit Institution Accounting Regulation (Verordnung über die Rechnungslegung der Kreditinstitute) are classified under "Other assets and liabilities" as of the December 2010 reporting date. Trading portfolio derivatives are listed separately in the Statistical Series Banking statistics, in Tables I.1 to I.3. 2 For building and loan associations: including deposits under savings

2022 Sep. Oct.	3,245,595	12,012	522,559	554,738	113,122		
Nov.	3,338,047	14,874	561,376	546,860	128,993		

<sup>1</sup> The reserve maintenance period starts on the settlement day of the main refinancing operation immediately following the meeting of the Governing Council of the ECB for which the discussion on the monetary policy stance is scheduled. 2 Article 5 of the Regulation (EU) 2021/378 of the European Central Bank on the application of minimum reserve requirements (excluding liabilities to which a reserve ratio of 0% applies, pursuant to Article 6(1)(a)). 3 Amount after applying the reserve ratio to the reserve base. The reserve ratio for liabilities with agreed maturities of up to two years was 2%

between 1 January 1999 and 17 January 2012. Since 18 January 2012, it has stood at 1%. 4 Article 6(2) of the Regulation (EU) 2021/378 of the European Central Bank on the application of minimum reserve requirements. 5 Average credit balances of credit institutions at national central banks. 6 Average credit balances less required reserves after deduction of the lump-sum allowance. 7 Required reserves after deduction of the lump-sum allowance.

<sup>\*</sup> The interest rate statistics gathered on a harmonised basis in the euro area from \* The interest rate statistics gathered on a harmonised basis in the euro area from January 2003 are collected in Germany on a sample basis. The MFI interest rate statistics are based on the interest rates applied by MFIs and the related volumes of euro-denominated deposits and loans to households and non-financial corporations domiciled in the euro area. The household sector comprises individuals (including sole proprietors) and non-profit institutions serving households. Non-financial corporations include all enterprises other than insurance corporations, banks and other financial institutions. The most recent figures are in all cases to be readed as required as provisional. include all enterprises order than insurance corporations, banks and other financial institutions. The most recent figures are in all cases to be regarded as provisional. Subsequent revisions appearing in the following Monthly Report are not specially marked. Further information on the MFI interest rate statistics can be found on the Bundesbank's website (Statistics/Money and capital markets/Interest rates and yields/Interest rates on deposits and loans). • The statistics on outstanding amounts are collected at the end of the month. • The effective interest rates are calculated either as

annualised agreed interest rates or as narrowly defined effective rates. Both calculation annualised agreed interest rates or as narrowly defined effective rates. Both calculation methods cover all interest payments on deposits and loans but not any other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance. 2 Data based on monthly balance sheet statistics. 3 Secured and unsecured loans for home purchase, including building and home improvements; including loans granted by building and loan associations and interim credits as well as transmitted loans granted by the reporting agents in their own name and for their own account. 4 Loans for consumption are defined as loans granted for the purpose of personal use in the consumption of goods and services. 5 For the purpose of these statistics, other loans are loans granted for other purposes such as business, debt consolidation, education, etc. 6 Including overdrafts (see also footnotes business, debt consolidation, education, etc. 6 Including overdrafts (see also footnotes 12 to 14 on p. 47)

For footnotes \* and 1 to 6, see p. 44°. For footnote x see p. 47°. + For deposits with an agreed maturity and all loans excluding revolving loans and overdrafts, credit card debt: new business covers all new agreements between households or non-financial corporations and the bank. The interest rates are calculated as volume-weighted average rates of all new agreements concluded during the reporting month. For overnight deposits, deposits redeemable at notice, revolving loans and overdrafts, credit card debt: new business is collected in the same way as outstanding amounts for the sake of simplicity. This means that all outstanding deposit and lending business at

the end of the month has to be incorporated in the calculation of average rates of interest. **7** Estimated. The volume of new business is extrapolated to form the underlying total using a grossing-up procedure. **8** Including non-financial corporations' deposits; including fidelity and growth premiums. **9** Excluding overdrafts. **10** Annual percentage rate of charge, which contains other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance

For footnotes \* and 1 to 6, see p. 44•. For footnotes + and 7 to 10, see p. 45•, 11 For the purposes of the interest rate statistics, a loan is considered to be secured if collateral (amongst others financial collateral, real estate collateral, debt securities) in at least the same value as the loan amount has been posted, pledged or assigned. 12 Including revolving loans which have all the following features: (a) the borrower may use or withdraw the funds to a pre-approved credit limit without giving prior notice to the lender; (b) the amount of available credit can increase and decrease a funds are borrowed and repaid; (c) the loan may be used repeatedly; (d) there is no obligation of regular repayment of funds. 13 Overdrafts are defined as debit balances

on current accounts. They include all bank overdrafts regardless of whether they are within or beyond the limits agreed between customers and the bank. 14 Including convenience and extended credit card debt. Convenience credit is defined as the credit granted at an interest rate of 0% in the period between payment transactions effected with the card during one billing cycle and the date at which the debt balances from this specific billing cycle become due. 15 The amount category refers to the single loan transaction considered as new business. x Dominated by the business of one or two banks. Therefore, the value cannot be published due to confidentiality.

Sources: The calculations for the insurance sectors are based on supervisory data according to Solvency I and II and for pension funds on IORP supervisory data and own data collections as of 2020 Q1. Until 2019 Q4 these are compiled using Solvency I supervisory data, supplemented by voluntary reports and own calculations. 1 Accounts receivable to monetary financial institutions, including registered bonds, borrowers' note loans and registered Pfandbriefe. For pension funds as of 2020 Q1 fair values, previously book values. 2 Including deposits retained on assumed reinsurance as well as registered bonds, borrowers' note loans and registered Pfandbriefe. For pension funds

as of 2020 Q1 fair values, previously book values. **3** Including reinsurance recoverables and claims of pension funds on pension managers. **4** Valuation of listed securities at the corresponding consistent price from the ESCB's securities database. **5** Not including the reinsurance business conducted by primary insurers, which is included there. **6** The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included. **7** Change in data sources.

Sources: The calculations for the insurance sectors are based on supervisory data according to Solvency I and II and for pension funds on IORP supervisory data and own data collections as of 2020 Q1. Until 2019 Q4 these are compiled using Solvency I supervisory data, supplemented by voluntary reports and own calculations. 1 Including deposits retained on ceded business as well as registered bonds, borrowers' note loans and registered Pfandbriefe. 2 Including claims of pension funds on pension managers and entitlements to non-pension benefits. 3 Technical reserves "life" taking account of

transitional measures. Health insurance is also included in the "non-life insurance" sector. 4 Own funds correspond to the sum of "Net worth" and "Shares and other equity". 5 Not including the reinsurance business conducted by primary insurers, which is included there. 6 Valuation at book values. The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included. 7 Change in data sources.

<sup>1</sup> Bearer debt securities with maximum maturities according to the terms of issue of over 4 years. Structured debt securities, debt securities with unscheduled redemption, zero coupon bonds, floating rate notes and bonds not denominated in Euro are not included. Group yields for the various categories of securities are weighted by the amounts outstanding of the debt securities included in the calculation. Monthly figures

are calculated on the basis of the yields on all the business days in a month. The annual figures are the unweighted means of the monthly figures. Adjustment of the scope of securities included on 1 May 2020. **2** End of year or month. **3** Source: Deutsche Börse AG. **4** Only debt securities eligible as underlying instruments for futures contracts; calculated as unweighted averages.

Source: Bundesbank calculations based on Federal Statistical Office data. 1 Annual figures based on the calculations of the Federal Statistical Office. Bundesbank supplementary estimations for the reporting years after 2011 that are not yet available. The quarterly figures contain numerous off-budget entities which are assigned to the general government sector as defined in the national accounts but are not yet included in the annual calculations. From 2012 also including the bad bank FMSW. 2 The annual figures do not tally with the sum of the quarterly figures, as the

latter are all provisional. The quarterly figures for some insurance sectors are estimated. **3** The development of the types of expenditure recorded here is influenced in part by statistical changeovers. **4** Including discrepancies in clearing transactions between central, state and local government. **5** On the revenue side, this contains proceeds booked as disposals of equity interests and as loan repayments. On the expenditure side, this contains the acquisition of equity interests and loans granted. **6** Including central government liquidity assistance to the Federal Employment Agency.

Source: Federal Ministry of Finance and Bundesbank calculations. 1 This total, unlike that in Table X. 5, does not include the receipts from the equalisation of burdens levies, local business tax (less local business tax transfers to central and state governnent), real property taxes and other local government taxes, or the balance of untransferred tax shares. 2 Respective percentage share of central, state and local government in revenue: wage tax and assessed income tax 42.5:42.5:15, corporation tax and non-assessed taxes on earnings 50:50:-, final withholding tax on interdest income and capital gains, non-assessed taxes on earnings 44:44:12. 3 After deducting child benefits and subsidies for supplementary private pension

plans. **4** After deducting employee refunds and research grants. **5** After deducting research grants. **6** Final withholding tax on interest income and capital gains, non-assessed taxes on earnings. **7** The allocation of revenue to central, state and local government, which is adjusted at more regular intervals, is regulated in Section of the Revenue Adjustment Act. Respective percentage share of central, state and local government in revenue for 2021: 45.1:51.2:3.7. The EU share is deducted from central government's share. **8** Respective percentage share of central and state government for 2021: 41.4:58.6. **9** For the breakdown, see Table X. 7.

Sources: Federal Statistical Office; Federal Employment Agency. \* Annual and quarterly figures: averages; calculated by the Bundesbank; deviations from the official figures are due to rounding. 1 Workplace concept; averages. 2 Monthly figures: end of month. 3 Number within a given month. 4 Mid-month level. 5 Relative to the total civilian labour force. 6 Excluding government-assisted forms of employment and seasonal jobs, including jobs located abroad. 7 From January 2017 persons receiving additional income assistance (unemployment benefit and unemployment benefit II at the same time) shall be assigned to the legal category of the Third Book of the Social Security

Code (SGB III). **8** Statistical break due to late recording of unemployed persons in the legal category of the Second Book of the Social Security Code (SGB II). **9** Unadjusted figures estimated by the Federal Employment Agency. In 2020 and 2021, the estimated values for Germany deviated from the final data by a maximum of 0.1% for employees subject to social contributions, by a maximum of 0.9% for persons solely in jobs exempt from social contributions, and by a maximum of 28,1% for cyclically induced short-time work. **10** From May 2022, calculated on the basis of new labour force figures. **11** Initial preliminary estimate by the Federal Statistical Office.

<sup>\*</sup> Non-financial groups admitted to the Prime Standard segment of the Frankfurt Stock Exchange which publish IFRS consolidated financial statements on a quarterly or half-yearly basis and make a noteworthy contribution to value added in Germany. In some cases revised. Excluding groups engaged in real estate activities. 1 Farnings before interest, taxes, depreciation and amortisation. 2 Quantile data are based on the groups' unweighted return on sales. 3 Annual figures do not always match the sum of

the two half-year figures. See Quality report on consolidated financial statement statistics, p. 3. 4 Adjusted for substantial changes in the basis of consolidation of large groups and in the reporting sample. See the explanatory notes in Statistical Series Seasonally adjusted business statistics. 5 Including groups in agriculture and forestry. 6 From H1 2018 or 2018 onwards: significant changes in IFRS standards, impairing comparability with previous periods.

<sup>\*</sup> Assets and liabilities vis-à-vis all countries within and outside the euro area. Up to December 2000 the levels at the end of each quarter are shown, owing to revaluations, at market prices; within each quarter, however, the levels are computed on the basis of cumulative transaction values. From January 2001 all end-of-month levels are valued at market prices. 1 Mainly net claims on TARGET2 balances (acc. to the respective country designation), since November 2000 also balances with non-euro area central banks

within the ESCB. 2 Mainly long-term debt securities from issuers within the euro area. 3 Including estimates of currency in circulation abroad. 4 See Deutsche Bundesbank, Monthly Report, October 2014, p. 22. 5 Difference between External assets and External liabilities. 6 Euro opening balance sheet of the Bundesbank as at 1 January

81°

<sup>\*</sup> The assets and liabilities vis-à-vis non-residents of banks (MFIs) in Germany are shown in Table 4 of Section IV., "Banks". Statistical increases and decreases have not been

eliminated; to this extent, the changes in totals are not comparable with the figures shown in Table XII.7.

<sup>\*</sup> The effective exchange rate corresponds to the weighted external value of the currency concerned. The method of calculating the indicators of the German economy's price competitiveness is consistent with the procedure to compute the effective exchange rates of the euro. A decline in the figures implies an increase in competitiveness. The weights are based on trade in manufactured goods and services. For more detailed information on methodology and weighting scale, see the website of the Deutsche Bundesbank (https://www.bundesbank.de/content/796162). 1 The calculations are based on the weighted averages of the changes in the bilateral exchange rates of the euro vis-à-vis the currencies of the following countries: Australia, Bulgaria, Canada, China, Croatia, Czechia, Denmark, Hong Kong, Hungary, Japan, Norway, Poland, Romania, Singapore, South Korea, Sweden, Switzerland, the United Kingdom and the United States. Where current price and wage indices were not available, estimates were used. 2 Includes countries belonging to the group EER-19 and additionally Algeria, Argentina, Brazil, Chile, Colombia, Iceland, India, Indonesia, Israel, Malaysia, Mexico,

Morocco, New Zealand, Peru, Philippines, the Russian Federation, Saudi Arabia, South Africa, Taiwan, Thailand, Turkey, Ukraine and United Arab Emirates. The ECB suspends the publication and calculation of the euro foreign exchange reference rate against Russian rouble with effect from March 2, 2022 until further notice. For the calculation of effective exchange rates, an indicative rate is used for the Russian Federation from that date. It is calculated from the daily RUB/USD rates determined by the Bank of Russia in conjunction with the respective ECB's euro foreign exchange reference rate to the US dollar. 3 Annual and quarterly averages. 4 Euro area countries (from 2001 including Greece, from 2007 including Slovenia, from 2008 including Cyprus and Malta, from 2009 including Slovakia, from 2011 including Estonia, from 2014 including Lathuania) as well as Canada, Denmark, Japan, Norway, Sweden, Switzerland, the United Kingdom and the United States. 5 Euro area countries (current composition) and countries belonging to the group EER-19. 6 Euro area countries (current composition) and countries belonging to the group EER-42.

Deutsche Bundesbank Monthly Report December 2022 84°

85°

# Overview of publications by the Deutsche Bundesbank

This overview provides information about selected recent economic and statistical publications by the Deutsche Bundesbank. Unless otherwise indicated, these publications are available in both English and German, in printed form and on the Bundesbank's website.

The printed publications are available free of charge to interested parties and may be obtained through the Bundesbank's order portal. Up-to-date figures for selected statistical datasets are available on the Bundesbank's website. In addition, the new Statistical Series provide a new basic structure and advanced options for using data and are also available on the Bundesbank's website.

## Annual Report

#### Financial Stability Review

## Monthly Report

A list of the articles published in the period from 2010 to 2021 is available on the Bundesbank's website.

## **Monthly Report articles**

## April 2022

- Potential macroeconomic consequences of the war in Ukraine – simulations based on a severe risk scenario
- Development of the debt situation in the euro area private non-financial sector since the outbreak of the COVID-19 pandemic
- Central government's debt brake: options for stability-oriented further development
- Demand for euro banknotes issued by the Bundesbank: current developments

#### June 2022

- Outlook for the German economy for 2022 to 2024
- Pension insurance scheme: long-term scenarios and reform options
- Inflation-induced bracket creep in the income tax scale
- Public finances in the euro area: current developments and challenges
- The Bundesbank's surveys of firms applications for assessing the financial situation in the corporate sector

#### July 2022

- Distributional Wealth Accounts for households in Germany – results and use cases
- Factors influencing international portfolio flows
- Cross-border interoperability of central bank digital currency
- Government debt in the euro area: developments in creditor structure

#### August 2022

- The current economic situation in Germany

#### May 2022

The current economic situation in Germany

#### September 2022

- Negative interest rate policy period and pandemic as reflected in the Bank Lending Survey
- Productivity effects of reallocation in the corporate sector during the COVID-19 crisis
- The performance of German credit institutions in 2021
- The role of the International Monetary Fund in preventing and managing crises

#### October 2022

- State government finances in 2021: Surplus and additional reserves from emergency borrowing
- Member States' financial relationships with the EU budget and the Next Generation EU off-budget entity in 2021
- The validity of interest parity in times of crisis
- Market conditions for Bunds in the context of monetary policy purchases and heightened uncertainty

#### November 2022

- The current economic situation in Germany

#### December 2022

- Outlook for the German economy for 2023 to 2025
- Rise in energy prices, the exchange rate of the euro and Germany's price competitiveness
- Access to cash in Germany results of a representative public survey

#### Statistical Series\*

#### **Banks**

- Banking statistics, monthly
- Statistics on payments and securities trading,
   September

#### Corporate financial statements

- Consolidated financial statement statistics,
   June/December
- Financial statement statistics (extrapolated results), December
- Financial statement statistics (ratios), May
- Financial statement statistics (ratios provisional data), May

#### Economic activity and prices

 Seasonally adjusted business statistics, monthly

#### **Exchange rates**

Exchange rate statistics, monthly

## External sector

- Balance of payments statistics, monthly
- Direct investment statistics, April
- International investment position and external debt, monthly

## Macroeconomic accounting systems

- Financial accounts, June

## Money and capital markets

- Capital market indicators, monthly
- Investment funds statistics, monthly
- Securities issues statistics, monthly

## Special Statistical Publications

- 1 Banking statistics guidelines, January 2022<sup>1,2</sup>
- 2 Banking statistics, customer classification, January 2022<sup>2</sup>

3 Aufbau der bankstatistischen Tabellen, July 2013<sup>1,2</sup>

32/2022

New facts on consumer price rigidity in the euro

7 Notes on the coding list for the balance of payments statistics, September 2013

33/2022

Going below zero - How do banks react?

## Special Publications

34/2022

Global monetary and financial spillovers: Evidence from a new measure of Bundesbank policy shocks

Makro-ökonometrisches Mehr-Länder-Modell, November 1996<sup>1</sup>

35/2022

Robust real-time estimates of the German output gap based on a multivariate trend-cycle decomposition

Europäische Organisationen und Gremien im Bereich von Währung und Wirtschaft, May 1997¹

36/2022

Die Zahlungsbilanz der ehemaligen DDR 1975 bis 1989, August 1999¹

The impact of natural disasters on banks' impairment flow – Evidence from Germany

The market for German Federal securities, May 2000

37/2022

Macro-Econometric Multi-Country Model: MEMMOD, June 2000

Basel III and SME bank finance in Germany

38/2022

Bundesbank Act, September 2002

The effects of sanctions on Russian banks in TARGET2 transactions data

Die Europäische Union: Grundlagen und Politikbereiche außerhalb der Wirtschafts- und Währungsunion, April 2005<sup>1</sup>

39/2022

The Eurosystem's asset purchase programmes, securities lending and Bund specialness

Die Deutsche Bundesbank – Aufgabenfelder, rechtlicher Rahmen, Geschichte, April 2006<sup>1</sup>

40/2022

Determinants of TARGET2 transactions of European banks based on micro-data

European economic and monetary union, April 2008

41/2022

Who creates and who bears flow externalities in mutual funds?

Weltweite Organisationen und Gremien im Bereich von Währung und Wirtschaft, March 2013<sup>1</sup>

42/2022

Robust real rate rules

## Discussion Papers°

#### 43/2022

Δ τονίονν (

The global financial cycle and macroeconomic tail risks

A review of some recent developments in the modelling and seasonal adjustment of infra-monthly time series

For footnotes, see p. 88°.

#### 44/2022

Chinese supply chain shocks

#### 45/2022

A nonlinear generalization of the Country-Product-Dummy method

## 46/2022

What drives inflation? Disentangling demand and supply factors

#### 47/2022

On the macroeconomic effects of reinvestments in asset purchase programmes

#### 48/2022

Real interest rates, bank borrowing, and fragility

#### 49/2022

Estimating the impact of quality adjustment on consumer price inflation

## Banking legislation

- 1 Bundesbank Act, July 2013, and Statute of the European System of Central Banks and of the European Central Bank, June 1998
- 2 Gesetz über das Kreditwesen, January 2008¹
- 2a Solvency Regulation and Liquidity Regulation, February 2008<sup>2</sup>

<sup>\*</sup> The Statistical Series replace the Statistical Supplements and, in part, the Special Statistical Publications; they will be provided exclusively on the Bundesbank's website under Publications/Statistics.

O Discussion papers published from 2000 are available online.

<sup>1</sup> Publication available in German only.

<sup>2</sup> Available only as a download.
