The German original of this Monthly Report went to press at 11 a.m. on 11 December 2020.

Publishing schedules for selected statistics can be downloaded from our website. The statistical data are also published on the website.

The Monthly Report is published by the Deutsche Bundesbank, Frankfurt am Main, by virtue of Section 18 of the Bundesbank Act. It is available to interested parties free of charge.

This is a translation of the original German language version, which is the sole authoritative text.

■ Economic conditions

Underlying trends

Economic recovery likely to suffer limited setback in Q4

In the fourth quarter of 2020, the economic situation in Germany is being shaped by the recent significant acceleration in infection rates. The additional containment measures in place from the beginning of November are interrupting the economic recovery and are likely to lead to a setback. The decline in gross domestic product is likely to be relatively slight in the final quarter of the year, however, and by no means on a similar scale as in the second quarter.¹ This is mainly due to the fact that the measures are now much more narrowly defined and are concentrated on particularly contact-intensive services. As the recovery in global trade is relatively robust, the manufacturing sector, which got off to a strong start in the fourth quarter, is likely to provide support. The Ifo Institute's surveys show that, despite the partial lockdown, manufacturing firms even rated their business situation in November more positively than in October although they downgraded their business expectations. By contrast, sentiment in the economic sectors directly affected by containment measures deteriorated dramatically in November. In the hotel and restaurant sector, for example, it was roughly as negative as in April. A sharp decline in business can be expected in these areas. Moreover, according to the GfK survey, consumer sentiment has also shown a marked deterioration recently.

Industry

Industrial output had a buoyant start to Q4

Industrial output continued to climb steeply in October 2020. Compared with September, it rose by 3¼% in seasonally adjusted terms, exceeding the average of the third quarter by 5%. Industrial output was thus still down by 4¼% on the pre-crisis level in the fourth quar-

ter of 2019. With an increase of one-eighth, output in the automotive sector showed particularly sharp growth compared with the third quarter. This trend is likely to have continued beyond October. According to the German Association of the Automotive Industry, the number of passenger cars manufactured in November rose again by just over one-tenth in seasonally adjusted terms. On an average of October and November, the number of units produced was one-fifth higher than in the third quarter and pre-crisis levels were attained again in November. Driven by the automotive sector, capital goods production expanded substantially in October compared with the third quarter (+6¼%). While output of intermediate goods showed the same strong increase, consumer goods output fell slightly (-¾%). Despite the steep rise, the capital goods sector is still well below its pre-crisis level (-7¼%). By comparison, consumer goods and, in particular, intermediate goods saw only a slight decline in output (-2¾% and -1% respectively).

New orders in German industry have been recovering steadily since the low point in April. In October, demand for German industrial products rose for the sixth time in a row in seasonally adjusted terms (+3% compared with September). This means that new orders were again markedly above the pre-crisis level of the final quarter of 2019. New orders were significantly higher than the level recorded before the crisis in the case of intermediate goods (+4½%) and capital goods (+2¾%), but new orders of consumer goods were slightly down on their pre-crisis levels again in October (-¾%). Looking at capital goods compared with the pre-crisis period, demand for motor vehicles stands

New orders largely up on pre-crisis level again

¹ This also applies if the containment measures are tightened significantly in December – as was being discussed at the cut-off date for this report. Many sectors of the economy significantly reduce activity in the last days of December anyway. For further information on the macroeconomic outlook, see pp. 15 ff. of this Monthly Report.

Deutsche Bundesbank

out in particular (+8¼%). Orders from Germany and abroad rose by roughly the same amount (+5¼%) compared with the third quarter. Foreign demand was boosted mainly by new orders from non-euro area countries (+8%, euro area +1¼%).

In October, nominal industrial sales continued to increase sharply on the month in seasonally adjusted terms (+4%). As with output, intermediate and capital goods, particularly in the automotive sector, outpaced consumer goods in terms of sales growth. Similar to the pattern in preceding months, export sales rose more strongly than sales to domestic customers compared with the third quarter, with particularly sharp sales growth recorded outside the euro area. However, compared with pre-crisis levels, foreign sales are still down by roughly the same amount as domestic sales, as the slump in foreign sales in the spring was significantly stronger. In October, exports remained on the more moderate recovery path embarked upon in July. Nominal exports of goods saw only a slight seasonally adjusted rise on the previous month (+¾%) but compared with the previous quarter the improvement was comparatively steep (+3¼%). Exports to non-euro area countries – notably the United States, the United Kingdom and the newly industrialised countries in Asia – grew more strongly than those to the euro area. Nominal imports of goods increased more slowly than exports. In October, they rose only slightly on the month in seasonally adjusted terms (+¼%). The quarter-on-quarter growth was stronger (+2¼%). In comparison with pre-crisis times, the shortfall is as high as for exports (-6%) in nominal terms, but significantly lower in real terms (-2%).

Industrial sales expanded sharply in October, but only small increase in exports and, above all, imports of goods

Construction

The coronavirus crisis is still having only a small impact on the German construction sector. Construction output rose sharply in October 2020 compared with the slightly depressed third quarter (+3¾%) and thus also exceeded

Construction output up, order situation and capacity utilisation very favourable

the previous year's level markedly. The finishing trades, where the data are typically prone to revision, have flourished in particular (+7%). New orders were up by 3% in the third quarter. Measured by the reach of the order books in the main construction sector as determined by ifo Institute surveys in November, the order situation can still be classified as very good. Equipment utilisation also remained well above its long-term average in November according to the ifo Institute.

Labour market

In November, there were again somewhat more notifications of short-time working, mainly from the hotel and restaurant sector

According to the available data, the renewed tightening of measures to contain the pandemic in November 2020 have so far not led to any strong reactions in the labour market. Compared with just under 150,000 in October, notifications of short-time working were filed for just over half a million employees between 1 and 25 November, which is nowhere near the figures from March or April, however. This is due, in part, to the fact that business closures were ordered in fewer sectors and that the notifications were mainly concentrated on the hotel and restaurant sector. According to the provisional figures of the Federal Employment Agency, the number of short-time workers fell to 2.2 million by September, which was slightly more than one-third of April's peak figure.

Unemployment down in November, too

Despite the stricter lockdown measures, registered unemployment continued October's positive development in November. The official unemployment figure was 39,000 lower than in the previous month after seasonal adjustment and the unemployment rate fell by 0.1 percentage point to 6.1%. For the first time since the start of the pandemic, unemployment in both October and November fell more sharply in the category of SGB III job seekers (those receiving unemployment benefits under the statutory unemployment insurance scheme), which is more closely related to economic activity than unemployment under category SGB II, where persons receive basic social

benefits. Active labour market policy measures did not have any discernible impact on the change in unemployment.

Data on employment are available up to October and reflect the slight recovery process before the tighter contact restrictions came into force. Compared with the previous month, total employment increased by 20,000 persons in seasonally adjusted terms. Self-employment continued to decrease, in line with the trend that has been evident for some time now. By contrast, there was a slight rise in the number of employees. The leading employment indicators did not deteriorate even under the rules in force since the beginning of November, which means that a significant decline in employment is unlikely in the short term.

Employment continued to recover slightly in October, leading indicators show no deterioration in short term

Prices

Crude oil prices rose markedly in November 2020, as the global economic outlook for the medium term brightened on the back of positive news on vaccination research. Compared with October, they were up by almost 7% on average, but were still 30% below their previous year's level. Prices continued their upward trend in the first two weeks of December. As this report went to press, the price of a barrel of Brent crude oil stood at US\$50. Crude oil futures were trading at slight discounts. The discount on crude oil futures was US\$½ for deliveries six months ahead and US\$1¼ for deliveries 12 months ahead.

Crude oil prices rising

Energy prices drove import prices distinctly higher in October overall. By contrast, other goods cost the same as a month earlier. Domestic industrial sales prices were also up slightly. This was attributable in equal parts to energy and other goods. Compared with the previous year, however, prices at the import level were 3.9% lower and domestic industrial sales prices dropped by 0.7%. Price dynamics at the upstream stages of consumer prices had been similar in the preceding months.

Import and producer prices higher

Consumer prices unchanged in November

Consumer prices (HICP) overall remained unchanged in November in seasonally adjusted terms, as in the previous month. Energy prices fell markedly despite higher oil prices. Food prices rose slightly overall, although tobacco products, which are classified as food, became significantly cheaper. By contrast, prices of industrial goods excluding energy remained constant. Services were more expensive than in the previous month. However, the meaningfulness of this figure is likely to be limited because the measures to contain the spread of the virus mean that there is a lack of price representativeness. This mainly concerns recreation activities such as travel.² Headline HICP inflation was down by 0.7% on the year, after coming down by 0.5% in October.³ The rate fell from +0.1% to -0.1% when excluding energy and food. Setting aside travel services and clothing, whose prices normally fluctuate sharply, the rate remained slightly positive at just over ¼%. At the turn of the year, headline HICP inflation and HICP inflation excluding energy and food should also be visibly up on the year. VAT rates will then be raised again, which is likely to have a similar effect on consumer prices as when they were lowered in July. Furthermore, the introduction of CO₂ emission permits is likely to make mineral oil products and gas perceptibly more expensive.

■ Public finances⁴

Statutory health insurance scheme

Slightly higher deficit for SHI scheme

The statutory health insurance (SHI) scheme (comprising the health insurance institutions and the health fund) recorded a deficit of €1 billion in the third quarter of 2020. This represented a deterioration of €½ billion compared with the previous year. The statutory health insurance institutions and the health fund developed in very different ways.

Health insurance institutions posted a deficit of €3 billion. This was almost €3 billion higher

than in the previous year. Overall, institutions' expenditure rose by 8%, although this figure appears to be based to a large extent on estimates. More favourable outturns might emerge over the following quarters. Revenue rose by 3½%. Health insurance institutions' reserves fell to just under €18 billion by the end of September.

Higher deficit for health insurance institutions

Following a fall in coronavirus infection rates in the third quarter, the utilisation of regular services was back up to significantly higher levels than those recorded in the second quarter. In addition, many benefits were expanded, not least owing to the coronavirus pandemic, including in the area of long-term care. Individual expenditure items developed as follows.

Sharp rise in expenditure

- Spending on hospital treatment, a particularly large expenditure item, grew by 9½% in the third quarter. Looking at January to September in aggregate, it was thus almost 1½% up on the corresponding prior-year figure. This does not include financial compensation for keeping capacity free for the treatment of COVID-19 patients. These central government payments are routed by the health fund to the respective hospitals via the state governments. Including these payments, hospitals received 16½% more funds in the first three quarters than in the same period of the previous year.

- As usual, health insurance institutions had to estimate expenditure on outpatient medical treatment as almost no accounting data were available for the reporting period. The health insurance institutions posted a very strong increase of just under 13½%, al-

² According to the procedure agreed with Eurostat, the relevant prices were either approximated using alternative sources or estimated (imputed) on the basis of past values.

³ The CPI figure was -0.3% compared with -0.2%.

⁴ In the short commentaries on public finances, the emphasis is on recent outturns. The quarterly editions of the Monthly Report (published in February, May, August and November), by contrast, contain an in-depth description of public finance developments during the preceding quarter. For detailed data on budgetary developments and public debt, see the statistical section of this report.

though estimates are currently likely to be even more uncertain than usual. This also applies, for example, to spending on coronavirus tests.

- By contrast, the strong growth in spending on pharmaceuticals tailed off considerably in the third quarter, eased by the VAT cut in mid-2020.
- The institutions' finances were also strained by a number of health insurance institutions expanding their pension provisions very sharply.

Health fund in surplus thanks to special central government grant

The health fund recorded a clear surplus of €2 billion (following a deficit of €½ billion in the previous year). Without a special central government grant of €3½ billion, it would have posted a deficit. Employees' contributions rose by 1½%, buoyed by contributions payable on short-time working benefits. By comparison, contributions payable on unemployment benefits climbed significantly more strongly. Contributions payable on pensions grew fairly robustly, unaffected by the pandemic. Overall, contribution receipts were up by 3%. The fund's expenditure normally consists almost exclusively of transfers to the health insurance institutions. These rose by 4%, as planned. This figure does not yet include pandemic-related financial assistance granted to providers of therapeutic treatment and investment grants for intensive care beds (totalling almost €½ billion). In addition – as described above – the health fund routed central government payments of €3 billion to hospitals via the state governments (with a neutral effect on the balance).

This year's deficit roughly as expected before crisis: central government offsets additional burdens

In the first three quarters taken together, the SHI scheme's deficit increased by €3 billion on the year to just under €7 billion. Despite the pandemic, a final-quarter surplus is likely to be recorded as usual. Nevertheless, a substantial deficit is also expected for the year as a whole (following a deficit of €1 billion in 2019 according to the annual accounts). For the health in-

Finances of the statutory health insurance scheme*

Source: Federal Ministry of Health. * Health fund and health insurance institutions (consolidated). Preliminary quarterly figures. The final annual figures differ from the total of the reported preliminary quarterly figures as the latter are not revised subsequently.
 Deutsche Bundesbank

urance institutions, it could roughly match the previous year's level (just under €2 billion). For the health fund, it is likely to (somewhat) exceed the deficit of €2 billion expected before the pandemic. On balance, this would mean the SHI scheme would close only marginally worse off than had been expected before the outbreak of the coronavirus crisis. This is primarily on account of extensive central government funds, which are broadly offsetting the additional burdens.

For the coming year, the group of SHI estimators expects the health fund's deficit to shrink to €1 billion. Although contribution receipts (+2½%

Group of estimators expects lower health fund deficit for 2021

compared with 2020 if the contribution rate remains unchanged) are passed on to the health insurance institutions with a neutral effect on the balance, €0.9 billion is being channelled from the liquidity reserve to the health insurance institutions in order to broadly compensate them for the reduction in SHI contributions payable on occupational pensions since the beginning of 2020. In addition, transfers are to be made to the Innovation and Structural Funds.

Strong expenditure growth expected for health insurance institutions

Besides the expansion in benefits over the past few years, the catching-up of postponed procedures from 2020 could weigh on health insurance institutions. The Federal Ministry of Health expects the health insurance institutions' expenditure to rise steeply by 6½%.⁵ If average supplementary contribution rates remain unchanged, the health insurance institutions would be faced with a large financial shortfall of €18 billion – the same amount as total reserves currently available. However, as reserves may not be earmarked in their entirety and as they are also unevenly distributed among the health insurance institutions, distinct contribution rate increases would be expected. €18 billion, taken in isolation, would be the equivalent of revenue amounting to around 1.2 percentage points of the contribution rate.

Additional central government funds and reserve withdrawals to limit increase in supplementary contribution rates

The Federal Government is aiming to widely limit the increase in supplementary contribution rates and is therefore providing an additional central government grant of €5 billion. It also assumes that the health insurance institutions will withdraw a total of €8 billion from their reserves in order to cover their expenditure. To support this, the health fund is to shift part of its transfers from health insurance institutions with higher reserves to those with lower reserves on a one-off basis. In addition, the upper limit on reserves is being lowered from 1.0 to 0.8 times the scheme's monthly expenditure. After deducting the special central government grant and the assumed reserve withdrawals, the health insurance institutions' arithmetical financial shortfall will shrink to around €5 billion given the current average

supplementary contribution rate. The arithmetical supplementary contribution rate for 2021 set by the Federal Ministry of Health will rise accordingly by 0.3 percentage point compared with the average rate for 2020 to 1.3%. Each health insurance institution may decide for itself whether to adjust its own supplementary contribution rate. However, health insurance institutions with reserves above the lowered upper limit are not permitted to raise their supplementary contribution rates. Furthermore, the efforts of many health insurance institutions to hold higher reserves are set to be curbed by the cuts in transfers.

Overall, the increase in supplementary contribution rates is likely to remain limited on average. The institutions' deficit (total reserve withdrawals) will rise significantly. A large deficit is therefore expected in the SHI scheme for 2021. Given the dependence on the further course of the pandemic and macroeconomic developments, uncertainty remains very high.

Large deficit expected in SHI scheme overall for 2021

Public long-term care insurance scheme

The public long-term care insurance scheme posted a surplus of €1 billion in the core area in the third quarter of 2020.⁶ In the previous year, the surplus stood at €½ billion. This improvement is chiefly attributable to the fact that the one-off additional central government funds of just under €2 billion exceeded the extraordinary expenditure to be financed in connection with the coronavirus pandemic by €½ billion in the reporting quarter.

Higher surplus due to central government funds

⁵ There was no consensus among the estimators with regard to estimating expenditure. The health insurance institutions expect their expenditure to rise by 7%. The discrepancy in the expenditure levels amounts to €1½ billion and corresponds to revenue equivalent to one-tenth of a percentage point of the contribution rate.

⁶ The developments outlined here and in the remainder of the text exclude the provident fund. This fund uses transfers financed by contributions from the core area to accumulate assets. These assets are to be depleted again in the 2030s to dampen the expected contribution rate rise. At the end of the third quarter of 2020, the accumulated reserves stood at just over €7½ billion.

Strong growth on the revenue and expenditure sides

Total revenue grew by 18½% on the year. Excluding the additional central government funds, the increase still stands at 3½%. The somewhat lower employees' contributions were offset by significantly higher contributions payable on unemployment benefits and pensions. Expenditure rose very steeply by 15½%. Cash benefits were up by 10½%, largely owing to an increase in the number of benefit recipients. Spending on non-cash benefits, a very large expenditure item, rose by 19%. This was mainly due to extraordinary pandemic-related expenditure on outpatient, day-patient and full inpatient facilities.⁷ In addition, most of the coronavirus bonus for nursing staff was paid out in the third quarter. Overall, extraordinary pandemic-related expenditure amounted to almost €1½ billion. By contrast, regular expenditure on full inpatient care fell slightly. Adjusted for extraordinary pandemic-related expenditure, spending on benefits rose by 4%.

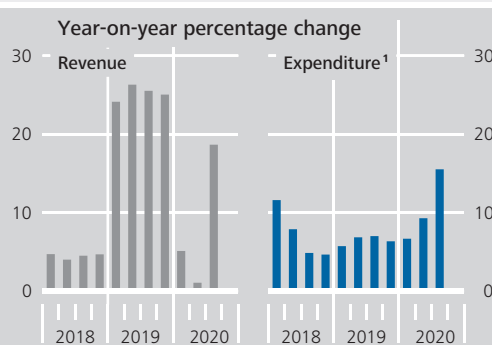

Clear surplus expected for year as a whole

After the first three quarters, the long-term care insurance scheme recorded a surplus of €1½ billion (previous year: +€2 billion). A significant surplus is also expected for the year as a whole, although this is likely to be markedly lower than in the previous year (2019: just over €3 billion according to final accounting figures). This still relatively favourable development is driven by the fact that central government essentially shielded the long-term care insurance scheme from the additional demands stemming from the coronavirus.

Deficit likely next year

Contribution receipts will probably continue to grow moderately next year. However, owing to the rule-based raising of benefit rates, expenditure is expected to grow robustly. The financial result is therefore likely to deteriorate sharply and turn into a deficit. It will still be possible, initially, to cover this using the relatively high general reserves (end-2019: €7 billion). However, funding pressure is unlikely to ease going forward, with contribution rate increases likely on account of demographic changes.

(€179.8 billion). After deducting the higher redemptions and taking account of changes in issuers' holdings of their own debt securities, net redemptions of domestic debt securities amounted to €18.0 billion. The outstanding volume of foreign debt securities in Germany rose by €21.3 billion during the reporting month, boosting the outstanding volume of debt instruments in the German market by €3.3 billion overall.

Slight rise in enterprises' capital market debt

Domestic enterprises raised their capital market debt only marginally in October, by €2.0 billion (previous month: €23.7 billion). The vast majority of issuances were attributable to non-financial corporations; on balance, all had maturities of more than one year.

Net public sector redemptions

In the reporting month, the public sector redeemed debt securities worth €3.7 billion net (following net issuance of €19.2 billion in September). Ultimately, this was solely attributable to central government, which reduced its cap-

ital market debt by €6.0 billion. It mainly redeemed five-year Federal notes (Bobls, €21.2 billion) and – to a lesser extent – Treasury discount paper (Bubills, €2.6 billion). This contrasted with net issuance of two-year Federal treasury notes (Schätze, €5.0 billion) and Federal bonds with maturities of 7 to 30 years (Bunds, €9.0 billion in total). State and local governments issued their own bonds worth €2.3 billion net.

Domestic credit institutions reduced their capital market debt by €16.3 billion in October (following net issuance of €23.5 billion in September). In particular, there was a fall in the outstanding volume of debt securities issued by specialised credit institutions (€10.2 billion) and in the outstanding volume of other bank debt securities (€4.5 billion). Moreover, there were net redemptions of mortgage Pfandbriefe and public Pfandbriefe (€0.9 billion and €0.6 billion, respectively).

Fall in credit institutions' capital market debt

The Bundesbank was the main buyer on balance, adding a net €24.5 billion worth of bonds – primarily acquired under the Eurosystem's asset purchase programmes – to its portfolio, the vast majority of which were domestic bonds issued by the public sector. On balance, domestic non-banks and credit institutions expanded their bond portfolios by €16.0 billion and €9.2 billion, respectively. In both instances, buyers' interest was chiefly focused on foreign paper. By contrast, non-resident investors reduced their holdings of German debt securities by €46.4 billion net. On balance, they primarily sold bonds issued by private issuers.

Purchase of debt securities

Equity market

In October 2020, domestic enterprises issued €1.1 billion worth of new shares in the German equity market, compared with €20.7 billion in the previous month. The volume of foreign equities in the German market rose by €4.0 billion. Domestic non-banks were almost the sole net buyers of shares (€4.8 billion). Domestic

Net issuance in the German equity market

credit institutions expanded their equity portfolios by €0.3 billion in net terms.

Mutual funds

German mutual funds record moderate inflows

Domestic mutual funds recorded net inflows of €11.7 billion in October 2020 (compared with €10.1 billion in September). On balance, specialised funds reserved for institutional investors were virtually the sole beneficiaries of such inflows (€11.0 billion). Among the fund providers, the main sellers of new shares were mixed securities-based funds (€6.7 billion), followed to a lesser extent by equity funds (€1.9 billion) and open-end real estate funds (€1.4 billion). The outstanding volume of foreign mutual fund shares distributed in Germany increased by €3.7 billion during the month under review. In October, mutual fund shares were purchased almost exclusively by domestic non-banks (€14.9 billion). Domestic credit institutions purchased mutual fund shares worth €0.9 billion net. By contrast, foreign investors off-loaded German mutual fund shares for €0.4 billion net.

■ Balance of payments

Current account surplus down

Germany's current account recorded a surplus of €22.5 billion in October 2020, down €2.7 billion from the previous month's level. This was chiefly attributable to a fall in the goods account surplus. The surplus in invisible current transactions, which comprise services as well as primary and secondary income, decreased only slightly.

Reduced surplus in goods account

In October, the surplus in the goods account declined by €2.6 billion on the month to €20.0 billion, with imports of goods recording a sharper increase than exports.

At €2.5 billion, the surplus in invisible current transactions in October was slightly down on the previous month's level. The deficit in the secondary income account widened by €1.1

Higher secondary income deficit almost offset by rises in services and primary income account balances

billion to stand at €4.3 billion. Receipts fell, mainly owing to lower government revenue from current taxes on income and wealth. In addition, expenditure rose slightly, especially due to higher payments to the EU budget in connection with financing related to gross national income. In the services account, the deficit narrowed by €0.7 billion to €0.2 billion. This was attributable to a slight increase in receipts, chiefly as a result of higher receipts from financial services and other business services. Expenditure remained slightly below the previous month's figure, with the pandemic-related decline in travel expenditure having had a significant dampening effect. Net receipts on primary income went up slightly by €0.3 billion to €7.1 billion.

Portfolio investment sees outflows

In October 2020, international capital markets recorded rising yield spreads in favour of US investments in the run-up to the US presidential elections. In addition, there were signs of a second wave of the COVID-19 pandemic in Europe, although it had not yet had an impact on real economic activity. It was against this backdrop that Germany's cross-border portfolio investment recorded net capital exports of €76.3 billion (following net capital imports of €34.5 billion in September). The main reason for this reversal was non-resident investors disposing of German securities worth €47.0 billion net. This was chiefly attributable to a one-off effect, which resulted in non-residents returning large volumes of private (primarily corporate) bonds (€20.4 billion). On top of this, they also sold public bonds (€14.2 billion), money market paper (€11.7 billion) as well as a small volume of mutual fund shares (€0.4 billion) and shares (€0.3 billion). Conversely, domestic investors acquired foreign securities worth €29.3 billion. They bought (primarily euro-denominated) bonds (€17.4 billion), shares (€4.3 billion), money market paper (€3.9 billion) and mutual fund shares (€3.7 billion).

Financial derivatives recorded net capital exports of €0.8 billion in October (September: €5.6 billion).

Financial derivatives

Direct investment posted net capital exports of €2.9 billion in the reporting month (following inflows totalling €3.3 billion in September). Domestic enterprises increased their foreign direct investment by €12.5 billion. They boosted their equity capital in non-resident subsidiaries by €3.2 billion, almost entirely through reinvested earnings. In addition, they granted, on balance, €9.3 billion in loans to affiliated enterprises abroad. Foreign direct investment stocks in Germany rose by €9.7 billion as a result of transactions. Foreign enterprises supplied their subsidiaries in Germany with €4.0 billion of equity capital and provided €5.6 billion on balance via intra-group lending.

Direct investment posts net capital exports

Other statistically recorded investment – which comprises loans and trade credits (where these do not constitute direct investment), bank deposits and other investments – registered net inflows amounting to €52.0 billion in October (following outflows totalling €51.7 billion in September). The banking system alone recorded net inflows of €50.7 billion. The Bundesbank's net capital imports accounted for €39.8 billion of this amount, which was attributable to the €67.9 billion decrease in the TARGET2 balance. At the same time, however, deposits from non-resident counterparties also decreased. On balance, a further €10.9 billion flowed to monetary financial institutions (excluding the Bundesbank). Transactions by enterprises and households in other investment resulted in net capital imports of €3.4 billion. In this position, the government closed as the only sector with net capital exports (€2.2 billion).

Other investment registers inflows

The Bundesbank's reserve assets grew slightly – at transaction values – by €0.1 billion in October.

Reserve assets

Outlook for the German economy for 2021 to 2023

The outlook for the German economy is still being shaped by the COVID-19 pandemic. In the third quarter, a large portion of the prior losses in activity were recouped. However, in the final quarter of 2020 and the first quarter of 2021, the German economy will probably experience a limited setback because of the pandemic's resurgence. Subsequently, though, it is likely to resume its strong growth. This is based on the assumption that the pandemic containment measures will be quickly loosened from spring 2021 in the wake of medical advances, and ultimately expire altogether in the early months of 2022. As a result, consumption opportunities previously made impossible by the pandemic will open up again and be utilised, and the current exceptionally high level of saving will fall sharply. Consequently, the economic recovery will be driven primarily by private consumption.

In this scenario, which is considered the most likely, real gross domestic product (GDP) will see a strong calendar-adjusted rise of 3% in 2021 and 4½% in 2022, following a decline of 5½% this year. In 2023, the rate of GDP growth will then approach that of potential growth. Real GDP will return to its pre-crisis level at the beginning of 2022, and potential output will follow suit only a little later.

Consumer price inflation will decline significantly to 0.4% this year, primarily because of the temporary cut in VAT rates and the collapse in crude oil prices. In 2021, both the reversal of the VAT cut and the introduction of CO₂ emission certificates will drive up prices. After adjustment for the VAT effect, core inflation excluding energy and food will probably be somewhat higher than 1% in both years. The dampening impact of weak macroeconomic demand will outweigh the price-boosting supply-side effects of the pandemic. Subsequently, as growth in wages becomes stronger again and profit margins recover along with demand for goods, these factors will increase price pressures. In 2023, inflation could reach just over 1½%.

Public finances are playing a substantial role in stabilising the economy as a whole. As a result, the general government deficit will probably reach around 5% of GDP this year, and the Maastricht debt ratio will rise to approximately 70%. Public finances will subsequently improve as the economy recovers and the pandemic support measures come to an end.

The economic outlook is highly uncertain, particularly with regard to the pandemic and its economic impact. For this reason, the projections cover two scenarios for how the pandemic will unfold: a milder and a more severe scenario. In the first scenario, the economy will see a significantly faster and stronger recovery. In the second, by contrast, GDP will not reach its pre-crisis level until the end of 2023, with potential output taking a substantial hit. The rate of inflation will then be perceptibly lower. All in all, the risks – also looking beyond the pandemic – both to economic growth and inflation appear roughly balanced as things currently stand.

In Q3, German economy recovered strongly but not fully from prior pandemic-induced slump

Economic outlook¹

The German economy's current situation and short-term outlook hinge on the COVID-19 pandemic. The pandemic triggered an unprecedented slump in economic activity in the second quarter of 2020. Contact-intensive services whose business operations were substantially restricted or completely halted by government-imposed containment measures and voluntary behavioural adjustments took a particularly hard hit. This restriction of consumption opportunities due to the pandemic made the saving ratio soar and placed a very substantial strain on private consumption in the

first half of 2020. Exports saw an even sharper fall, primarily because of the collapse in foreign demand due to the pandemic. This – and the high degree of uncertainty over the economic outlook – caused enterprises' investment in machinery and equipment to plunge. As expected in the June projection, real GDP in the second quarter of 2020 was, overall and after seasonal and calendar adjustment, 11½% below the figure recorded for the final quarter of 2019.² As infections decreased and containment measures were eased, the economy saw a strong recovery in the third quarter of the year, driven by rebound effects and, to some extent, catch-up effects in the sectors previously hit by a major slump. Nonetheless, economic output was still 4% below its pre-crisis level, with substantial variation among the different economic sectors. The countermovement in the summer, which was much stronger than expected, was bolstered by fiscal and monetary policy support measures, which were not yet included in the June projection.

In the final quarter of 2020 and the first quarter of 2021, the economic recovery is likely to be interrupted. The autumn resurgence of the pandemic in Germany and many of its key trading partner countries could cause economic output to decline again – albeit moderately compared with the spring – by an approximate figure of just under 1%. This is based on the assumption that containment measures will remain necessary in the first quarter of 2021, with a similar average negative impact on the economy as in the fourth quarter of 2020.³ However, the economy is not likely to take a hit like that in the second quarter of 2020, nor is GDP expected to fall to such a low level. ² See Deutsche Bundesbank (2020a).

³ A further temporary tightening of the measures could potentially allow easing at a somewhat earlier stage. Provided economic activity is not restricted on a broad scale and for a long period of time, the impact on the average level of GDP relative to the baseline scenario will therefore probably remain relatively small.

present, significantly fewer sectors face such tight restrictions as in the spring. It is primarily contact-intensive segments that are being affected directly by the restrictions. In addition, the experience now gained in dealing with the pandemic is mitigating the adverse economic impact of the measures. Demand from abroad is also likely to remain more stable. As a result, losses in sectors of the economy not directly affected by restrictions, such as industry, should remain limited. This assessment is also reflected in business sentiment. In November, enterprises in the services sector (excluding trade) assessed their business situation as having markedly worsened, whereas industrial enterprises once again considered their situation to have significantly improved. Business expectations deteriorated somewhat towards the end of the period under review but remained far above the lows recorded in the second quarter of 2020.⁴

Economy to return to strong upward trajectory later in projection horizon

Later in the projection horizon, the German economy is likely to return to the path of recovery that was interrupted in the final quarter of 2020 and the first quarter of 2021, and to grow strongly for some time. In the baseline scenario, it is assumed that the containment measures can be quickly loosened from spring 2021 and will expire altogether in the early months of 2022. In addition to greater opportunities for outdoor activities in the second and third quarters of 2021, medical advances in combating the pandemic – most notably, widely available vaccines – will play a crucial role in this.

GDP level significantly higher than projected in June 2020

All in all, in the baseline scenario, this points to a strong, temporarily interrupted recovery for the German economy, manifesting itself in a growth path close to that of potential output. Following the sharp decline of 5½% this year, real GDP could grow at strong calendar-adjusted rates of 3% in 2021 and 4½% in 2022, before slackening off to 1¾% in 2023.⁵ GDP will thus have already returned to its pre-crisis level by the beginning of 2022. This means that GDP is expected to be above the figure in the June projection across the entire forecast horizon.

⁴ See Deutsche Bundesbank (2020b).

⁵ Without adjustment for calendar effects, the decline in 2020 will be somewhat lower, at -5.1%, because there are more working days in 2020 than there were in 2019. In 2022 and 2023, this calendar effect will be negative (see the table above).

Aggregate output and output gap

Price, seasonally and calendar adjusted

Sources: Federal Statistical Office and Bundesbank calculations. 2020 to 2023 Bundesbank projections. ¹ Deviation of GDP from estimated potential output.

Deutsche Bundesbank

This is mainly because the recovery both in Germany and abroad was significantly stronger than expected in the third quarter of 2020.

In the baseline scenario, the pandemic will have only relatively little impact on potential output, partly thanks to the extensive monetary, fiscal and labour market policy support measures.⁶ Compared with the assessment before the outbreak of the pandemic, potential output for 2023 is now estimated to be just over 1% lower. It should be noted, however, that the containment measures will be a temporary roadblock to exploiting this potential in full in 2020 and 2021 on the supply side as well. As the German economy continues its recovery, it will approach its potential output thanks to a renewed rise in demand and the elimination of supply constraints, and capacity utilisation is likely to shift into the normal range from 2022 onwards.

Only comparatively minor losses of potential output owing to pandemic

Irrespective of the resurgence of the pandemic in many countries, German exports are likely to be a key pillar of economic activity in the final quarter of 2020. To some extent, this momentum will be supported by anticipatory effects created by the United Kingdom's withdrawal from the EU single market and the customs union with effect from 1 January 2021. Although services in particular are suffering under the newly imposed containment measures, including in other European countries, demand for goods from Germany's export range will probably also be affected. Enterprises' export expectations have fallen significantly of late. For this reason, and on account of the burdening effect Brexit will then have, exports are likely to temporarily decline somewhat at the beginning of 2021. Upon the resumption of the economic upturn in key partner countries, exports should rapidly gain pace from the second quarter of 2021 onwards and be a solid pillar of economic recovery. However, it is assumed that

Exports solid pillar of economic recovery

⁶ The estimated growth rate of potential output will rise from 0.9% this year to 1.2% in 2023 owing to a renewed increase in contributions from the capital stock and total factor productivity.

Underlying conditions for macroeconomic projections

This projection is based on assumptions made by Eurosystem experts about the global economy, exchange rates, commodity prices and interest rates. They are based on information available as at 18 November 2020. The assumptions regarding economic activity in the euro area are derived from projections made by the national central banks of the euro area countries.¹ These projections incorporate the fiscal policy measures that have been either adopted or adequately specified and are deemed likely to be implemented.

With regard to the coronavirus pandemic, the baseline scenario assumes that the latest reported advances in the development of a vaccine are confirmed and that a medical response to the virus can be effectively implemented in most countries, including those of the euro area and Germany, over the projection horizon. Large-scale vaccinations are likely to be carried out as early as 2021. As a result, the containment measures, which will remain in place in the final quarter of 2020 and the first quarter of 2021, may be relaxed rapidly from the second quarter of 2021 onwards and phased out altogether in the first few months of 2022.

Global economy recovering from deep recession

As expected in the June projection, global economic activity saw a historic decline in the second quarter of 2020. The recovery in global economic activity in the third quarter is likely to have been significantly stronger than assumed back then. However, the pace of growth is likely to weaken significantly in the final quarter of 2020 and the first quarter of 2021, partly owing to the renewed sharp rise in the number of infections worldwide in the autumn. Apart from China, where gross domestic product (GDP) fell sharply at the start of the year, but then,

in the second quarter, already exceeded the pre-crisis level of the end of last year, economic activity in almost all of the euro area's major trading partners is likely to remain below the level reached before the coronavirus crisis began until at least the second half of 2021.

Irrespective of how the pandemic progresses, the outlook for the United Kingdom in particular will be influenced by the form that trade relations with the European Union take once the transition period comes to an end. This projection assumes that no trade agreement will be reached by the end of the year, which means that the World Trade Organization's "most favoured nation" rules will apply from 1 January 2021.²

For the global economy as a whole excluding the euro area, an expansion rate of 5¾% is forecast for the coming year, following a decline of 3% this year, before economic activity grows in 2022 and 2023 at rates of 4% and 3½% respectively. A similar profile is assumed for international trade. Following a downturn of 9¼% this year, global trade (excluding the euro area) is expected to increase by 7% next year, before growing at rates of 4% in 2022 and 3½% in 2023.

Recovery process in euro area determined by course of pandemic

For the euro area, the slump in economic activity in the second quarter of 2020 was somewhat less dramatic than had been ex-

¹ The projections made by the national central banks of the euro area countries were completed on 25 November 2020.

² The previous projections had assumed the adoption of a trade agreement by the end of 2020. The assumption that has now been made matches that of the European Commission in its latest forecast (see European Commission (2020)).

Deutsche Bundesbank

pected in the June projection. In addition, the recovery in the third quarter was stronger than forecast in June owing to the extensive easing of containment measures and the significant recovery in world trade. Following the sharp rise in the number of infections, the restrictions put in place to contain the pandemic were tightened again in the fourth quarter. Compared with the second quarter, the current containment measures focus more on restricting contact in private settings and in the areas of recreation, restaurants and accommodation, as well as parts of the retail sector. This means that the services sector has once again been severely affected, whereas the impact on industry and construction is likely to have been only marginal. The measures taken are therefore likely to have a much less dampening effect on economic activity in the final quarter of 2020 and the first quarter of 2021 than in the second quarter. Given the general assumption of this projection that the pandemic will have been gradually overcome by medical solutions by the first quarter of 2022, containment measures could successively be eased over this period. A contraction of 8.1% is projected for the

euro area (excluding Germany) this year. As a result of the significantly muted expectations for the final quarter of 2020 and the first quarter of 2021, the growth rate for 2021 is now set at 4.3%, which is lower than in the June forecast. For the following years, growth of 4.1% is expected in 2022 and of 2.2% in 2023.

German exporters' sales markets, which were hit somewhat harder this year than world trade, are likely to expand less dynamically than global trade next year. The changing trade relations with the United Kingdom will also play a part in this. In 2022, the continued recovery of sales markets could slightly outpace that of world trade.

Scenarios illustrate high uncertainty about outlook for global setting

Given the high level of uncertainty about the global economic outlook on account of the pandemic, two alternative scenarios as to how the global economy might develop were constructed in addition to the baseline scenario of the projection – as in the June projection. Assuming lower economic burdens in the milder scenario, global GDP and world trade could expand distinctly more dynamically as early as next year. By contrast, if it takes longer to implement medical solutions to combat the pandemic, the economic recovery process would be slowed down considerably over the next two years. In the more severe scenario, global trade will not reach its pre-crisis level until sometime in 2023.

Technical assumptions of the projection

The assumptions regarding crude oil prices derived from forward prices indicate only a slight rise over the next three years. The prices of other commodities on a US dollar basis recovered very strongly by the third quarter³ and are already perceptibly back

³ See Deutsche Bundesbank (2020c).

over their pre-crisis levels. They are expected to continue to rise over the next three years in line with the anticipated recovery in the global economy.

At its meeting in June, the ECB Governing Council decided to extend the pandemic emergency purchase programme (PEPP). One important reason for this was that the outlook for price stability had deteriorated in light of the pandemic. The overall envelope of the programme was increased to €1,350 billion and the horizon for net purchases was extended until at least the end of June 2021.⁴ The rise in excess liquidity has led to a further decline in interest rates in the money market in recent months. Increased demand for safe assets given the renewed uptick in the number of infections and the associated deterioration in the economic outlook have also caused yields on ten-year Bunds to fall since June. Expectations of a possible recalibration of the monetary policy stance are also likely to have played a role here.⁵ Market expectations point to a rather moderate rise in yields over the projection horizon. In line with the technical interest rate assumptions and given the financial system's ample liquidity levels, bank lending rates are also expected to go up only slightly over the projection horizon.⁶ Financing conditions thus remain extremely favourable.

Following the June projection, the euro appreciated significantly against the US dollar; in the period used for deriving the exchange rate assumptions, it was trading at US\$1.18, which was 9¼% higher than the assumptions in the June projection. Compared with 42 currencies of major trading partners, the euro has appreciated by 3¾% since June.⁷

Fiscal measures provide support during coronavirus crisis

Extensive fiscal measures were taken into consideration in the projection, accounting for 4% of GDP in the current year's deficit. The vast majority of these were taken in re-

sponse to the coronavirus crisis, and these measures will largely be phased out again in subsequent years. However, a number of other decisions will then weigh on the government budget.

The aim of fiscal coronavirus measures is to support the healthcare system, enterprises and households and to stabilise the economy during the COVID-19 crisis.⁸ They are increasing the general government deficit sharply this year, while next year they will

⁴ See Deutsche Bundesbank (2020d).

⁵ Recent news of advances in the development of a vaccine was accompanied by a slight upwards movement. See Deutsche Bundesbank (2020e).

⁶ These forecasts are based on the assumption that the economic recovery process, together with the fiscal support measures adopted for the corporate sector and households – as well as the ample supply of liquidity to the markets – will ensure that risk premia on lending rates do not rise sharply.

⁷ In July, the European Central Bank adjusted the weights for calculating the effective exchange rates for the euro area. The broad group of countries was expanded from 38 to 42 countries. In addition, the weights now take account of trade in services as well as trade in goods; see European Central Bank (2020). The method used by the Bundesbank to calculate indicators of the German economy's price competitiveness has been changed in line with this; see Deutsche Bundesbank (2020f).

⁸ The coronavirus measures are relatively narrowly defined here: they do not include, for example, climate-related expenditure from the June 2020 economic stimulus package. This is longer-term and pursues objectives that go beyond short-term crisis support.

Coronavirus response measures affecting the deficit*

As a percentage of GDP

 Deutsche Bundesbank

have only a moderate impact, and then almost no effect from 2022 onwards.

The expenditure side mainly includes transfers by central government to enterprises, self-employed persons and those in liberal professions. In addition, the Federal Employment Agency provides relief to enterprises in terms of the social security contributions they pay on short-time working benefits (with restrictions until the end of 2021).⁹ For public passenger transport companies, the government is partially compensating losses this year. The eligibility criteria for the basic allowance (unemployment benefit II) were relaxed and entitlements to unemployment benefit were extended. Parents were supported by a child bonus. Government grants will stabilise the renewable energy (EEG) levy in electricity prices next year in order to ease the burden on enterprises and households. Additional expenditure is also required in healthcare: this expenditure was initially for protective equipment, additional intensive care capacity and

COVID-19 tests, and will be for vaccinations further down the line as well. In addition, central government is reimbursing hospitals for unoccupied beds in order to ensure capacity for the treatment of COVID-19 patients. Other parts of the healthcare sector were also compensated for coronavirus-related losses.

One factor on the revenue side is that VAT rates were temporarily lowered for the second half of 2020. A number of other measures essentially only shift tax revenue to a different point in time. For instance, enterprises were able to receive special VAT reimbursements in advance. Furthermore, import VAT will fall due one month later from next year onwards. Looking at taxes on earnings, enterprises are again able, amongst other things, temporarily to apply the declining balance method of depreciation when handling movable assets and to carry back losses from 2020 to a greater extent.

In addition to these measures affecting the deficit, the projection takes into account coronavirus measures that are reflected solely in the level of debt. These include, first and foremost, lending programmes with very extensive government guarantees and capital assistance. The debt effects of this are estimated to be 2% of GDP this year, which means that the use of this option is significantly below the extensive budgetary authorisations. In addition, debt (excluding the deficit effect) is temporarily rising slightly as enterprises receive tax deferrals and statutory health and public long-term care insurance schemes receive central government grants.

In addition to the coronavirus measures, the projection takes other fiscal measures into account. It is assumed that health insurance institutions will raise their supple-

⁹ The remaining expenditure on short-time working benefits is largely regarded as an automatic stabiliser (similar to unemployment benefit I).

mentary contribution rates sharply over the projection horizon (by almost 1½ percentage points on average compared with 2020, of which almost 1 percentage point will be in 2022). The contribution rate to the Federal Employment Agency will rise by 0.1 percentage point in both 2022 and 2023 to its planned level of 2.6%. In addition, the contribution rate to the statutory pension insurance scheme will have to be increased at the end of the projection horizon so that the reserve meets its lower limit. By contrast, revenue from income-related taxes is set to undergo a significant reduction, particularly as the solidarity surcharge will be partly abolished in 2021. On the expenditure side, the increase in child benefit from 2021 onwards and the new basic pension will make themselves felt. In addition, higher government capital transfers will be made not least in order to reduce the use of carbon energy sources and to foster digitalisation. The planned, credit-financed “Next Generation EU” (NGEU) off-budget

entity has already been taken into account: Germany will receive grants from this, which will predominantly be used for existing programmes according to announcements by the Federal Government. The inclusion of NGEU has virtually no direct impact on the projection of Germany’s public finances owing to its small volume (rising from 0.1% of GDP in 2021 to 0.2% in 2023).¹⁰

¹⁰ Overall, Germany will be burdened more heavily in future due to the EU budget. Owing to Brexit, net financial contributions will increase from 2021. In the longer term, the crisis programmes will also weigh on Germany: payments to finance the NGEU grants significantly exceed the NGEU grants the country will receive. The EU debt will have to be serviced by Member States, which is not reflected in the national fiscal indicators. See pp. 37 ff.

exports will pick up somewhat less sharply than German exporters’ sales markets. Compared with other euro area Member States, the price competitiveness of German enterprises will diminish as a result of stronger wage growth and higher domestic inflation.

The strained infection situation and the resulting uncertainty for sales prospects are likely to initially weigh on the propensity of many enterprises to invest. The gloomier export outlook is also slowing the recovery in industrial activity. As a result, production capacity utilisation will remain weak for the time being, which means that only a small amount of investment in renewing and expanding capacities will be required. However, as soon as the economy returns to its recovery path in the second quarter of 2021, foreign demand rises and under-utilisation falls, business investment should also regain momentum with a certain time lag. By the end of the projection horizon, business investment will then probably have returned to a

level that corresponds to normal economic conditions.

Private consumption remains heavily dependent on the pandemic situation. In the first half of 2020, consumers’ spending fell significantly more sharply than their disposable income, and the saving ratio mirrored this development, rising very steeply. While classic precautionary motives played a comparatively minor role, this development was primarily due to involuntary consumption restraint resulting from the pandemic and the measures taken to contain it: consumption opportunities were either not available or were not used by consumers owing to the risk of infection (see the box on pp. 26 f.). Although the saving ratio fell again markedly in the third quarter and private consumption made up a significant amount of ground, in the final quarter of 2020 and the first quarter of 2021, the pandemic situation, which has again become significantly more strained, is likely to restrict private consumption once more, result-

Private consumption characterised by pandemic-induced involuntary saving

Business investment will continue recovery after damper in Q4

ing in an increase in the saving ratio.⁷ However, private consumption is likely to suffer far less than in the second quarter of 2020. If, from the second quarter of 2021 onwards, the pandemic is gradually overcome by medical solutions, involuntary saving should diminish in significance. Private consumption would then recover very dynamically. Subsequently, then, some of the involuntary savings accumulated during the pandemic are likely to be spent in addition, and consumption will probably be caught up on. As this would be a temporary effect, private consumption is likely to lose significant momentum at a high level towards the end of the projection horizon.

Overall, housing construction investment little affected by coronavirus crisis

Housing construction investment has proved relatively robust to the pandemic over the course of 2020 thus far given that there have been only few restrictions on the supply side and demand has been affected only slightly. The second wave, too, has so far had only a small impact on sentiment in the construction sector.

Following a slight decline in the final quarter of 2020 and the first quarter of 2021, housing construction investment should return to an expansionary path that is in line with economic recovery from the second quarter of 2021 onwards. The improvement in the labour market and wages, which have been gradually rising more sharply again, will provide impetus.

The coronavirus pandemic has also so far left little mark on price dynamics in the housing market. This is partly due to the fact that demand for housing in connection with the pandemic fell only briefly. Households' disposable income, a key determinant of demand, rose substantially again as early as the third quarter of 2020. In addition, a temporary shift in demand towards housing due to the pandemic-induced relocation of professional and private activities to the home might have triggered a certain additional price impulse. Moreover, residential real estate is likely to remain an attractive form of investment in the low interest rate environment. On the supply side, meanwhile, there were hardly any disruptions that might have caused price-driving effects. Looking ahead, however, price dynamics are likely to weaken. For example, the affordability of credit-financed housing has deteriorated further in the light of the ongoing upward pressure on prices, despite the still highly favourable financing rates. In addition, the trend shift in demand for housing to areas outside urban centres, where the housing supply could be expanded more easily, could pick up steam as a result of the pandemic. Nevertheless, inflation rates will probably level off only gradually given the usual price inelasticity of housing.

House price dynamics robust during crisis but looking to weaken going forward

Real government investment will continue to develop dynamically this year and next. Priority areas will include transport and digital infra-

Government investment initially still growing dynamically

⁷ Expenditure made in anticipation of VAT rates being raised back to their previous levels at the turn of the year is expected to support private consumption in the fourth quarter of 2020. In return, however, this temporal shift in consumption will dampen consumption at the beginning of next year.

structures, childcare and schools. However, the coronavirus crisis will also weigh on the financial situation of central, state and local governments in the medium term, and the reserves in the fund to promote municipal investment will be depleted. It is therefore assumed that growth will decelerate markedly thereafter.

Government consumption increasing sharply this year

Real government consumption has been rising sharply this year as a result of the coronavirus pandemic. Compensation payments to hospitals for unoccupied beds as well as expenditure on personal protective equipment are considerably increasing intermediate consumption. In the years that follow, government consumption will initially stagnate and then grow moderately, as the one-off additional expenditure in connection with the coronavirus pandemic will no longer be a factor. Moreover, in view of the structural deficits of the central, state and local governments, slower growth is assumed, especially in the case of intermediate consumption.

Imports set to pick up substantially in wake of strong demand

Following a significant decline this year, imports will pick up substantially over the entire projection horizon in the wake of sharply rising demand from households and enterprises. Moreover, in 2022 and 2023, some of the involuntary savings could be spent on additional foreign travel, which had been cut back particularly sharply during the crisis. This expenditure by Germans abroad is treated as imports of services.

Current account surplus down markedly going forward

The current account surplus, which fell significantly in the second quarter of 2020 from more than 7% to just under 5% of GDP, already soared to just under 8% again in the third quarter. In the final quarter of 2020 and the first quarter of 2021, it could even temporarily rise somewhat more. The main reason for this is economic developments initially being less favourable in Germany compared with many non-European trading partners. As a result, imports from these countries are growing more slowly than German exports to these countries. By contrast, surpluses should decline markedly

Households' saving behaviour during the pandemic

Projections of private consumption expenditure are decisively shaped by expectations about households' disposable income and their saving ratio.¹ The saving ratio rose exceptionally sharply in the first half of 2020. This was probably not driven to any significant degree by classical precautionary motives. An econometric analysis for the euro area showed, in fact, that only a relatively small percentage of the increase in the saving ratio

in the second quarter of 2020 can be explained by concerns about future job losses and loss of income.² On the contrary: much of the rise is attributed to involuntary saving caused by the pandemic. Saving motives in Germany are likely to have been similar.

Participants' responses to the Bundesbank Online Panel Households (BOP-HH) in August 2020 shed some light on the reasons why households were reluctant to consume in the first half of 2020.³ Just under one-half of respondents said that they had reduced their consumption expenditure in connection with the restrictions imposed during the pandemic. Only just under one-sixth of respondents stated that this was primarily a result of a direct drop in income. In all other cases, motives affecting the saving ratio were decisive, with only around one-fifth citing classical precautionary motives driven by fears of a future loss of income. Reasons directly related to the pandemic played a much greater role. Just under one-half of respondents reduced their consumption expenditure because a number of consumption options were not available or only partially available in the spring – for example, because businesses were ordered to close or as a result of travel restrictions. This involuntary consumption restraint was particularly pronounced among higher-income households. This differs from the findings on the classical precautionary motive. Where consumption expenditure was reduced because households feared future income losses, the percentages were higher for lower-income households than for higher-income ones. Quite independently of the level of income, just over one-third also refrained from spending on certain goods and services for fear of catching the virus. Even without containment

² See Dossche and Zlatanos (2020). The level of classical precautionary saving is nevertheless high by historical standards.

³ For more information on the BOP-HH, see Beckmann and Schmidt (2020). See also Bernard et al. (2020), who evaluated data from the survey wave in May 2020. For a similar survey-based analysis, see the German Council of Economic Experts (2020).

measures that directly limit certain consumption opportunities, private consumption is therefore likely to suffer perceptibly if consumers see themselves as being exposed to an increased risk of infection.⁴

The insights gleaned from the household survey can be applied to the projections of the saving ratio and private consumption. Saving resulting from classical precautionary motives depends mainly on developments in the labour market. Once the labour market experiences a sustained recovery, the stimulus for the saving ratio is likely to wane. However, the greater importance of involuntary saving and cautious behaviour for fear of infection mean that future developments in the saving ratio as a whole – and thus also in private consumption – are likely to remain closely linked to assumptions regarding the pandemic. Both motives should decline as infection rates come down and containment measures can be incrementally lifted. Another question is what happens to the involuntary savings created during the pandemic once the health crisis is

over. As this form of saving is not really in line with households' preferences, one might, in principle, expect at least a certain part of it to be spent later. The saving ratio will therefore fall below its long-run average for some time. However, as the additional savings have been built up mainly by households with higher incomes, the assumption for such catch-up effects incorporated in the projection tends to be conservative. These households have a comparatively low propensity to consume in relation to their income,⁵ and a large part of their involuntary savings could lead to wealth remaining elevated for some time.

⁴ Roughly 45% of those questioned said that they considered some of their previous consumption expenditure to be unnecessary or imprudent. This could be because consumption options were not available during the lockdown (for instance travel). It could, however, also indicate that consumption behaviour has been adjusted, potentially permanently, in response to the pandemic.

⁵ See Drescher et al. (2020).

over the remainder of the projection horizon. Owing to the then strong domestic activity, imports will consistently rise more strongly than exports. The current account balance could therefore decline to 6½% of GDP by 2022, and subsequently continue to decrease.

■ Labour market

The labour market proved to be fairly robust to the economic turmoil caused by the pandemic. Fluctuations in employment and unemployment were comparatively moderate compared with the massive slump in the number of hours worked. This was due, in particular, to the extensive use of short-time work schemes to bridge the working hours lost, measures agreed by employers and trade unions to safeguard jobs, and stabilising government measures, as well as the rapid economic recovery which followed the slump in the second quarter. Accordingly, despite the renewed sharp rise in

economic output, only a small number of new employees were hired in the third quarter, and, instead, short-time work was cut back massively. In October, the employment level was still around 1½% below the pre-pandemic level.

In the final quarter of 2020 and the first quarter of 2021, the renewed temporary tightening of restrictions on economic activity will also hamper recovery in the labour market. Short-time work is likely to rise again in the sectors of the economy affected by closures, even though, overall, it will remain well below the level seen in the second quarter. Employment will fall slightly and unemployment could reach a somewhat higher level at the beginning of 2021 than in the second quarter of 2020.

As the economy picks up, working hours, in turn, will rise again first from the second quarter of 2021 onwards. The number of hours worked will grow, above all, as a result of the

Recovery to be interrupted in Q4 2020 and Q1 2021

As economy recovers, working hours will first return to normal, followed by employment, too

reduction in short-time work and working time accounts being filled up. From the second half of next year onwards, growing success in combating the pandemic is likely to increase the planning certainty of enterprises and thus also their willingness to recruit new staff. Even so, on an annual average for 2021, the employment level will still fall significantly short of the previous year's level at the beginning of the year due to a considerable carry-over effect. By comparison, employment growth will be fairly robust in 2022. On the other hand, the growth in working hours per person in employment will decelerate as these converge towards pre-crisis levels.

Unemployment set to fall from mid-2021, but will not reach pre-crisis levels over projection horizon

Contrary to employment, annual average unemployment for 2021 will be higher than the previous year's level. Although it will decline at an accelerated pace from mid-2021 onwards, it will not reach its pre-crisis level over the projection horizon. Its very low pre-pandemic level was the result of a long and mature upswing.

The labour supply is not heavily influenced by the pandemic, but it is influenced to some extent. The labour force is growing at a much slower pace in 2020 than previously and will even fall slightly in 2021. Some members of the workforce withdrew from the labour market, at least temporarily, when they lost their jobs. This is particularly the case for those who are not entitled to payments from the Federal Employment Agency, for example, because they were previously in low-paid employment. Labour force participation is therefore likely to show signs of a dip in the short term. Furthermore, immigration to Germany, which had played a major role in the upturn in employment in recent years, was considerably hampered by the pandemic-related restrictions. This year, net immigration to Germany will be roughly half as high as it was in 2019. From mid-2021 onwards, immigration is likely to go back up, which means that net migration to Germany could return to 250,000 persons over the course of the year. A minor catch-up effect is assumed in 2022. Together with rising labour force participation, this would lead to an increase in the size of the labour force.

Labour force participation and immigration temporarily depressed by pandemic; however, catch-up effects in 2022

Looking ahead to 2023 and beyond, however, it can be assumed that the underlying demographic developments will increasingly curtail the size of the labour force, despite high immigration and a growing propensity amongst individuals to participate in the labour force. Accordingly, employment will barely be able to rise further and labour supply constraints from the pre-crisis period will return.

Supply constraints to increase again in medium to long term

Labour costs and prices

Negotiated pay rates rose more slowly during the crisis than previously. Against the backdrop of the significant economic slump, in the 2020 pay round, employers and trade unions mostly agreed on job-protecting measures and low pay agreements. In the coming year, too, employers and trade unions will predominantly agree on small wage increases in the light of

Increase in negotiated pay rates depressed by crisis and not stronger again until 2022

the still subdued economic activity and higher unemployment. Employers and trade unions will not return to higher pay agreements until 2022 onwards when there is continued economic recovery.⁸

Actual earnings down in 2020 mainly due to short-time work, but then up at accelerated pace

The impact of labour market adjustments on actual earnings has been even more pronounced than on the negotiated pay rate. In particular, the large-scale deployment of short-time work schemes reduced the paid working hours per person in employment. The loss of earnings in some sectors was mitigated by negotiated or voluntary supplements by employers,⁹ which, in contrast to short-time working benefits, are a component of gross wages and salaries in the national accounts. Nevertheless, average actual earnings fell exceptionally sharply in the second quarter of 2020 and slightly for 2020 as a whole. As short-time work declines and working hours thus gradually increase, actual earnings will rise again more significantly, little by little. In the last year of the projection horizon, in addition to the then normalised economic framework data, intensified labour market shortages will also lead to substantial wage growth. Rising employer social contribution rates for the statutory health, unemployment and pension insurance schemes will additionally increase compensation per employee in 2022 and 2023 and contribute to upward pressure on prices.

Unit labour costs characterised by delayed recovery in productivity and wages

Unit labour costs are rising exceptionally steeply this year due to the crisis. This reflects the fact that labour productivity per person in employment is falling sharply, while labour costs are changing comparatively little.¹⁰ As the economy begins to recover, labour productivity is then likely to initially rise more strongly than labour costs. Unit labour costs will therefore fall markedly, especially in the coming year. Domestic inflation as measured by the GDP deflator will not be impacted by the sharp fluctuations in unit labour costs. Instead, these will be largely cushioned using aggregate profit margins. In 2023, unit labour costs will provide a more robust signal of domestic price pres-

Negotiated pay rates, actual earnings and compensation of employees

Sources: Federal Statistical Office. 2020 to 2023 Bundesbank projections. ¹ According to the Bundesbank's negotiated wage index. Deutsche Bundesbank

ures once more. As things currently stand, unit labour costs are likely to then rise markedly and enterprises' profit margins could also improve again somewhat. The GDP deflator could thus increase by around 1¾%.

Consumer inflation continued to decline over the second and third quarters, sinking to -0.7% in November as measured by the Harmonised Index of Consumer Prices (HICP). Besides falling energy prices, the VAT cut from July to December, of which probably just over 60% has been passed through to consumers, is also having an impact.¹¹ Setting aside this change to tax legislation, which was not included in the June projection, prices have developed roughly as expected over the last few months. For instance,

Underlying inflation trend in 2020 moderate as a result of the VAT cut ...

⁸ All past pay agreements included in the Bundesbank's negotiated pay rate statistics (around 500 collective wage agreements and provisions governing civil servant pay) are factored into the projections of negotiated wage increases. They are extrapolated beyond their contractual term, taking into account the overall economic situation and industry-specific features.

⁹ Special coronavirus payments, which are not subject to tax and social security insurance, also supported actual earnings in 2020.

¹⁰ At present, the large-scale deployment of short-time work, in particular, is reducing labour productivity. Here, as in the table on p. 25, the development of productivity and wages is described per capita. On an hourly basis, productivity will decline less sharply due to reduced working hours per person in employment and wages will rise considerably. The various approaches have little impact on unit labour costs.

¹¹ See Deutsche Bundesbank (2020b).

Deutsche Bundesbank

net food prices have risen sharply, not least owing to adverse weather conditions and higher costs for preventing the spread of infection. Looking at non-energy industrial goods and services, the weak demand caused by the pandemic did lead to significant price reductions in specific segments such as clothing and

travel. On the other hand, however, the dampening impact on prices was limited overall as it was counteracted by higher costs stemming from measures aimed at containing the number of infections or supply shortages. Excluding the VAT cut, annual average core inflation in 2020 therefore still stands at just over 1%, which is consistent with the average recorded over the past few years. Taking into account the tax cut, the core rate is likely to be 0.7%. Headline HICP inflation will probably rise by 0.4%.

The underlying inflation trend will remain subdued next year. Both aggregate demand and wage growth will remain muted at first, only becoming apparent in the inflation rate with a time lag. Furthermore, the costs incurred in connection with the measures to contain the pandemic will become less significant. However, the subdued underlying trend will be overshadowed by the reversal of the VAT cut. This is based on the assumption that, in response to the tax change, prices will be raised as sharply in January 2021 as they were lowered in July 2020.¹² Moreover, additional climate package measures will enter into force at the beginning of 2021. The introduction of carbon emission certificates in the transport and heating sectors will see a steep rise in prices for refined petroleum products and gas, which will only be partially offset by cuts to electricity prices.¹³ The climate package also involves an increase in motor vehicle tax, which is included in the services component and thus the core inflation rate; this will also drive prices up. Headline HICP inflation should therefore already start to return to perceptibly positive ter-

... and will be overshadowed in 2021 by VAT cut reversal and climate package measures

¹² Based on the current state of knowledge, towards the end of 2020, there are no plans to adjust prices to the level prior to the VAT cut, nor to raise them significantly beyond this level.

¹³ The climate package has been included in the projections since December 2019; see Deutsche Bundesbank (2019). The price path envisaged at the time for the carbon emission certificates was lower than today's figures. Besides this, in June 2020, the EEG levy, which is an important component of electricity prices, was capped in 2021 and 2022. Together, the climate package measures and the cap on the EEG levy will probably boost the HICP by 0.3 percentage point in 2021.

ritory from the beginning of 2021. As things currently stand, the second half of the year may well see fairly high inflation rates of around 2½% as prices in 2020 were dampened by the VAT cut.

Economic recovery reflected by pick-up in underlying inflation trend in 2022 and 2023

From the beginning of 2022, these legislative changes will barely influence consumer price inflation,¹⁴ and the HICP rate will probably reflect the economic situation more closely again. This applies to both the core rate and the headline rate, as energy and food prices are not likely to put a great deal of upward pressure on prices. However, prices should pick up owing to renewed wage growth. In addition, profit margins, which had previously been depressed, should also recover as aggregate demand rises. This is all the more true given that market concentration could increase in individual segments as a result of business closures in the wake of the pandemic. The remaining suppliers in these areas would then be able to increase their margins more easily. Overall, core and headline inflation – adjusted for legislative changes – could therefore climb from just over 1% in 2021 to 1.3% in 2022 before increasing further to around 1.5% or slightly more in 2023.

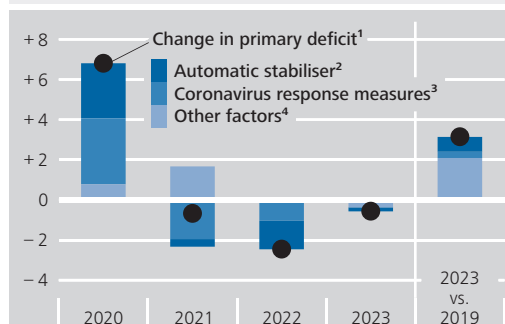

Public finances

Ups and downs in government deficits

Public finances are stabilising economic developments to a considerable degree this year. According to this projection, the government budget deficit will stand at around 5% of GDP after recording a surplus of 1.5% of GDP in 2019. The deficit will decline only slightly next year as the expiry of the measures to deal with the coronavirus pandemic is offset by expansionary fiscal policy elsewhere. In 2022, as coronavirus measures continue to expire and the economy recovers, the government deficit will then fall significantly. In 2023, the deficit will move towards 1% of GDP. Overall, the uncertainty surrounding the forecast remains high as a result of the coronavirus crisis.

Stabilising effect of the general government budget*

As a percentage of GDP, year-on-year change

* Bundesbank estimates. A positive change shows fiscal expansion. **1** Government deficit excluding interest expenditure. **2** Change in cyclical deficit. **3** For a further breakdown, see p. 22. **4** All other factors that influence the primary deficit (including measures not directly relating to the coronavirus crisis).

Deutsche Bundesbank

In structural terms – i.e. adjusted for cyclical and other temporary effects – public finances are likely to be in worse shape at the end of the projection horizon than before the crisis. The structural surplus of ½% of GDP in 2019 will be transformed into a structural deficit of around 1% of GDP in 2023, mainly owing to strong growth in spending on pensions, health and long-term care, as well as plans for the decarbonisation and digitalisation of the economy. Interest expenditure will have somewhat of a counterbalancing effect. Despite the higher debt ratio, it will continue to fall sharply, as interest rates on the high levels of new borrowing induced by the crisis are assumed to be negative on average. As a result, the average interest rate on government debt will fall again significantly, and could amount to just ½% in 2023.

Structural situation in 2023 less favourable than before the coronavirus crisis

The coronavirus pandemic, in particular, is shaping developments in 2020. The downturn is causing taxes and social contributions from regular employment to fall whilst, at the same time, expenditure on short-time working and unemployment benefits is rising. The measures taken to combat the coronavirus are having an

2020: automatic and active fiscal stabilisation

¹⁴ Prices for carbon emission certificates will be raised only moderately in 2022 and 2023, with ongoing reductions in electricity prices dampening the impact on headline energy inflation in 2022.

even greater impact (see pp. 21 f. for more information about the fiscal policy measures that these entail).

In 2021, the deficit will fall to around 4% of GDP. The economic cycle will have only slightly less of a negative impact on the government budget. Although economic activity will pick up, labour market developments, which are particularly important for the government budget, will lag behind. The fact that most of the coronavirus measures will be phased out by the end of 2021 will, in itself, significantly reduce the deficit. However, decisions that increase the deficit will be taken elsewhere. Furthermore, expenditure on pensions, healthcare and long-term care insurance will rise sharply.¹⁵

2021: only moderate decline in deficit at first, despite onset of economic recovery

In 2022, the deficit will then fall more sharply to around 2% of GDP, mainly as the economic recovery will be having a greater impact on the government budget. Moreover, most of the pandemic support measures will now have expired. Social spending will continue to grow fairly sharply, but will be offset by rising social contribution rates.

2022: Stabilising effect of government budget declining more sharply

The debt ratio, i.e. government debt over GDP, will rise to around 70% in 2020 (2019: 59.6%). Government deficits are financed primarily through additional government borrowing. Financial assets such as reserves belonging to social security funds are being deployed only to a small extent. In addition, the government-guaranteed coronavirus assistance loans, government capital injections and higher cash reserves are pushing up debt (coronavirus-related one-off effects which generally have no impact on the deficit). Moreover, nominal GDP in the denominator of the debt ratio is declining. The debt ratio will fall only slightly in 2021. Over the remainder of the period, however, it will then decline more sharply to around 65% in 2023.

Debt ratio up to around 70% in 2020, but set to fall significantly again later

¹⁵ The interaction between the 2018 pension package and the volatile wage and employment developments during the coronavirus crisis means that pensions are growing more strongly than wages; see also Deutsche Bundesbank (2020g).

From 2022 onwards, local government deficits will thus be significantly lower again and the coronavirus-related one-off effects will be reduced. Moreover, the portfolios of government-owned bad banks will continue to decline and nominal GDP will expand very significantly at times.

Risk assessment and alternative scenarios

Uncertainty remains unusually high, particularly with regard to how the pandemic will unfold

The outlook for the German economy in terms of economic activity and consumer prices remains unusually uncertain overall. Compared to the spring, more is now known about the virus, the measures to prevent its spread and the effects on the behaviour of economic agents and the economy itself. However, it remains difficult to gauge how the pandemic will unfold and what the macroeconomic consequences will be. In a situation like this, alternative scenarios help to illustrate the complex uncertainties surrounding the medical situation and its economic impact.¹⁶

Risks from external environment and overall risks are balanced

However, risks to the macroeconomic outlook are not limited to those arising directly from the pandemic. The German economy is also heavily dependent on global trade. The uncertainties that currently exist here are mainly centred around future trade relations between the EU and the United Kingdom as negotiations on the structure of a future trade deal are still ongoing. Although the projection already errs on the side of caution by assuming there will be a need to fall back on the World Trade Organization's "most favoured nation" rules (see the box on pp. 19 ff.), there are also downside risks relating to the economic implications this might have. There is a certain degree of hope that foreign demand will become more buoyant if the uncertainties that have surrounded global trade linkages for some time decline because, for instance, US trade policy is becoming more predictable. From today's perspective, this would result in a broadly balanced distribution of upside and downside risks

to the GDP and inflation outlook in the context of the international environment. This is also true from an overall perspective, as the risks associated with the pandemic are also broadly balanced. Although deviations would be more

¹⁶ See Deutsche Bundesbank (2020a).

serious in the more severe scenario than in the milder scenario, the milder scenario is somewhat more likely to occur.

Milder scenario: more successful implementation of medical solutions ...

In the milder scenario, medical solutions are available more promptly in Germany and abroad and are implemented more quickly. For example, large parts of the population might already receive a vaccination in the course of next year. The number of infections falls rapidly. Under these conditions, the containment measures could be fully phased out by the end of 2021.

... brings about a faster and stronger recovery

In this scenario, German enterprises' foreign demand recovers more quickly and private consumption in Germany expands earlier and more sharply. GDP already reaches its pre-crisis level in mid-2021; growth in 2022 and 2023 is nonetheless similar to that of the baseline scenario. The labour market picks up more quickly and unemployment falls to pre-pandemic lows by the end of the forecast horizon. Against this backdrop, potential output will remain largely unimpaired. The output gap will already have closed by the end of 2021 and will be in significantly positive territory from 2022 onwards. Although the price-driving effects of the costs of combatting the pandemic are smaller, given the more favourable macroeconomic environment, the inflation rate will nevertheless be somewhat higher than in the baseline scenario, especially in 2022 and 2023. In this scenario, public finances will develop much more favourably. The main reason for this is the more upbeat economic situation, which will lead to higher revenue from taxes and social contributions and lower expenditure on unemployment benefits.

The more severe scenario assumes that the developments in the crisis remain serious. Despite more stringent countermeasures, the pandemic is insufficiently contained in the final quarter of

2020 and the first quarter of 2021; over the next few years, too, these attempts achieve only limited success. The time taken to implement medical solutions in Germany and abroad spans the entire projection horizon, for instance because vaccines' effectiveness diminishes or because vaccination rates are not sufficiently high. Containment measures have to remain in place until the end of 2023, although they are eased little by little.

In this scenario, aggregate output will be affected substantially and on a sustained basis, despite even stronger support from public finances. This is because demand for German exports will be persistently weak and private consumption will remain depressed for a long time owing to the constraints and an increased propensity to save. The labour market situation will barely improve. In a scenario like this, GDP will be very slow to recover, only returning to its pre-crisis level at the end of the projection horizon, if at all. The impact on potential output and its growth would be severe and lasting. In this scenario, aggregate capacity remains underutilised over the entire projection horizon. Under these conditions, although combatting the pandemic will cause considerable costs for enterprises, leading to price increases, persistently weak demand for goods and the slack in the labour market will significantly dampen pressure on wages and prices and limit the scope for passing through higher costs. On balance, then, consumer price inflation will be markedly weaker than in the baseline scenario. Public finances will be significantly worse off in this scenario. The less favourable economic situation will push up the deficit ratio. It is assumed that enterprises will continue to receive direct assistance and that some coronavirus assistance loans will default. In addition, enterprises will rely more heavily on government assistance loans and equity capital.

More severe scenario: pandemic is not quickly overcome and constraints remain in place, ...

... causing serious and lasting damage to potential output

The informative value of national fiscal indicators in respect of debt at the European level

Fiscal policy has been playing a significant stabilising role during the coronavirus crisis, and measures funded nationally are at the forefront of these efforts. That said, extensive fiscal packages have been initiated at the European level, too. More than €1 trillion in borrowing – i.e. above 7% of the European Union's gross domestic product (EU GDP) – has been lined up for grants and concessional loans. This is fundamentally different than before. First, this move is intended to usher in a significant increase in borrowing. Second, the funds raised will no longer be used only to supply assistance loans but also for issuing grants to Member States on a considerable scale. The upshot of this is that the European level will have notable deficits for the first time, and debt servicing will weigh on future EU budgets.

This article illuminates the impact of this European debt, and these European deficits, on the informative value of national fiscal indicators. Analyses are usually based on national data and examine matters such as the sustainability of public finances or the effect of fiscal impulses on economic activity. Up until now, the EU budget has largely featured in these analyses as a direct component of national fiscal indicators, given that it is mostly funded by contributions made in the same year by Member States. This meant it could be disregarded by analysts. The situation is now set to change. Looking ahead, national deficits and debt will be lower initially if a Member State's expenditure is funded not by national borrowing but by debt-financed EU grants. While this improves the Member State's national fiscal indicators, its financial position will not be any better overall. This is because European debt will need to be serviced by taxpayers in the Member States at some point in the future on top of the national debt burden. Instead of interest and principal payments on national debt, there will be larger contributions to the EU budget.

Given this backdrop, it is crucially important, from the perspective of economic and fiscal policy analysis, for government revenue, expenditure, deficits and debt to be computed using statistical methods and reported in a transparent manner not just nationally but at the European level, too. Disclosures should follow the definitions used in the national accounts and be made available in a timely manner, just as they are for the Member States. That particularly goes for the Maastricht deficit and the Maastricht debt level. This is not currently the case. The final decision adopting the programmes needs to enshrine this form of statistical reporting on developments at the European level.

These disclosures could be used to provide a more comprehensive picture of the fiscal burdens weighing on Member States, amongst other things. There would be less risk of losing sight of European debt and the fiscal strain it involves. Budgetary rules should likewise take the European fiscal burdens into account. Rules that apply only to national indicators will be hollowed out if deficits and debt are transferred on a significant scale to the European level. It would also make sense for the national fiscal indicators designed to measure the effects of a fiscal impulse on economic activity to give consideration to payment flows with the EU.

European government sector borrowing enters new dimensions

European assistance mechanisms in the coronavirus crisis

Fiscal policy has been playing a significant stabilising role during the coronavirus crisis, with individual Member States bearing the brunt of this challenge. That said, extensive packages have also been rolled out at the European level¹ in support of Member States.² Measures include:³

- Up to €240 billion in debt raised by the European Stability Mechanism (ESM) for concessional loans to euro area countries;
- EU debt of up to €100 billion for concessional SURE loans⁴ to EU countries; and
- EU debt of up to €750 billion (at 2018 prices)⁵ for Next Generation EU (NGEU) assistance in the form of grants and concessional loans to EU countries.

New assistance heralds substantial changes ...

The European level had already raised debt before the advent of the coronavirus crisis, though the volume at that time was considerably smaller (EU: just over €50 billion; ESM: just under €120 billion). The newly adopted assistance programmes are set to be significantly larger in scope. On top of this, the NGEU programme is designed not only to provide loans to Member States but to issue non-repayable grants as well. In the past, EU debt was normally backed by claims on Member States, the idea being that it would be serviced out of the borrowers' debt service payments. In effect, the European government level reported no deficits (within the meaning of the national accounts) because the (net) financial assets remained unchanged. Under the new grant programmes, however, there are no credit claims to offset the European debt, which means the European government level will run deficits as defined in the national accounts. In subsequent years, the debt raised to fund these programmes will then have to be serviced out of the EU budget using Member State contribu-

tions.⁶ The EU budget will need to cover any interest charges that accrue plus the principal payments over the period from 2028 to 2058. Contribution-financed surpluses (as defined in the national accounts) would need to be generated in the EU budget in the amount needed to cover the principal payments.

Under the existing arrangement, any deficits and debt incurred at the European level are not reflected in the deficits and debt levels reported by Member States. This makes future national fiscal indicators less informative. Up to now, EU expenditure has largely been reflected directly in the aggregated national indicators, given that it was normally funded by Member States in the same year by their contributions to the EU budget. This meant that Member States' deficits and debt levels were correspondingly higher. The new arrangement will see a not-

... that influence the informative value of national fiscal indicators

¹ For the purposes of this article, "European level" means government activity at the supranational European level. The government sector at the European level comprises EU institutions, such as the EU budget, as well as intergovernmental agreements between European states, such as the ESM.

² For the decisions from April, see Deutsche Bundesbank (2020a); for those from July, see Deutsche Bundesbank (2020b) and the box on p. 39.

³ Member States are contributing furthermore, in the form of guarantees, to the pan-European guarantee fund created by the European Investment Bank (EIB) with a view to mobilising up to €200 billion as a source of financial support, above all for small and medium-sized enterprises. The EIB does not form part of the European government sector. Routine checks are generally made to establish whether activities performed by non-government units at the request of government should be assigned for statistical purposes to the government budget (rerouting). Some activities performed by KfW Group on behalf of the Federal Government fall into this category, for example. If the pan-European guarantee fund were to provide actual funding in addition to guarantees, this would probably have to be recorded statistically in the budgets of participating Member States.

⁴ SURE stands for "Support mitigating Unemployment Risks in Emergency".

⁵ Stating figures at 2018 prices means that the authorised volume of loans and grants increases annually at a fixed rate of 2%. This arrangement means that the NGEU programme will have a volume of €795 billion (€750 billion at 2018 prices) in its scheduled launch year of 2021. Since not all the resources will be allocated in 2021, the total amount, priced accordingly, will depend on how it is distributed over time; the volume here refers to payments (rather than commitments incurred).

⁶ The plan is for Member States to fund these additional contributions in part by levying a new tax harmonised across the EU.

Borrowing options available at the European level for funding COVID-19 response measures

To help alleviate the impact of the COVID-19 crisis, it was agreed in April 2020 to simplify access to the credit facilities offered by the European Stability Mechanism (ESM). This step means that euro area countries can now draw on credit facilities even if they are not subject to a macroeconomic adjustment programme. Funding for this European debt is jointly guaranteed via the ESM, which is why the ESM's assistance loans (up to 2% of euro area gross domestic product (GDP) in total, which roughly equates to €240 billion) offer particularly favourable interest rates. The Member States have not yet applied to use any of the ESM's credit lines, however.

In addition a new instrument known as SURE ("Support mitigating Unemployment Risks in Emergency") was created. This authorises the European Commission to raise up to €100 billion in debt on the EU's behalf. The idea is to provide EU Member States with concessional loans so that unemployment risks can be mitigated – for example, by providing short-time work benefits. Eighteen countries intend to tap into these loans, and around €90 billion has already been earmarked. Borrowing for the SURE instrument is underwritten by guarantees issued by Member States alongside what are known as budgetary margins. These margins in future EU budgets come about because the maximum amount of Member States' contributions to the EU budget that can be drawn down (the own-resources ceiling) is higher than the annual expenditure in the EU budget.

July 2020 saw the European Council agree on the Next Generation EU (NGEU) assistance programme which, like SURE, is funded by EU borrowing. Repayment is

guaranteed by increased margins in future EU budgets. NGEU's expected volume is €750 billion (at 2018 prices). Its centrepiece is the Resilience and Recovery Facility (RRF), which will see Member States receiving (non-repayable) grants totalling just over €310 billion. Further NGEU grants (of just under €80 billion) are to be provided through programmes included in the forthcoming medium-term financial framework's EU budget. Member States furthermore stand to receive a total of €360 billion in concessional loans. Funding conditions for the NGEU debt will probably be very favourable because the budgetary margin securing it is scheduled to rise sharply. Specifically, the own-resources ceiling is to be increased by 0.6% of gross national income (GNI) till 2058 (to 2% of GNI). If scheduled payments are not made (for example, if a country does not service its assistance loan), the remaining countries will generally be approached to cover payment on a pro rata basis.

NGEU has not yet been adopted, so a final decision on how the resources will be allocated across Member States is still pending. The European Commission has tabled a grants allocation key per Member State, based on population size, per capita GDP and pre-crisis unemployment. The decline in GDP brought about by the coronavirus in 2020 and 2021 will only be a factor for a small part of the grants. Loans are to be capped at 6.8% of a country's GDP. All NGEU resources need to be committed by the end of 2023 but can also be disbursed at a later date. Outflows will ultimately depend on how the national plans are implemented.

able portion of deficits and debt being shifted to the European level. National deficits and debt will be depressed (c.p.) when the European level borrows funds to disburse to Member States in the form of grants. The upshot of this is that the national fiscal indicators will appear more favourable initially, though European debt will still need to be serviced out of Member States' tax revenue, in addition to their national debt. In later years, Member States will face the burden of higher contributions to the EU budget to service the debt. Analyses of economic and fiscal policy will need to take account of these shifts between the national and European levels, which is why developments at the European level merit attention alongside the national fiscal data.

Make comprehensive reporting at the European level mandatory to create transparency

Economic and fiscal policy analysis can only deliver meaningful insights if the underlying national and European statistics alike are compiled in a complete, reliable and transparent manner. The European System of Accounts (ESA) is a harmonised reporting system, with Member States providing comprehensive sets of quarterly data in a timely manner. The ESA catalogues the various revenue and expenditure items for the government sector, with the balance being shown as net lending (+) or borrowing (-) as defined in the national accounts. The Maastricht debt level of Member States is likewise calculated and disclosed according to a harmonised set of standards.

Comparable data have not yet been made available for the European level, but it would be important to do so, given the plans for the European level to incur deficits and debt on a substantial scale. Like the Member States, the European level needs to provide a complete set of national accounts data in a timely manner following the same classification criteria. Simi-

larly, the Maastricht debt level and fiscal balance should be disclosed in Eurostat's press releases together with the national indicators. Any methodological issues should be ironed out by the same bodies that already ensure that national data are harmonised and quality-assured. In addition to the EU budget and the NGEU and SURE instruments, any other government activity at the European level would also need to be reported, showing the financial links to Member States. In the integrated national accounts system, the corresponding government revenue and expenditure items at the European level should match those reported at the Member State level. Another important point is to include the European level in the data on EU and euro area aggregates. The final decision adopting the NGEU programme should include a clause requiring the relevant statistical information to be made available in the future.

Supplement national fiscal indicators by adding information on the European government sector

There now follows an example of how national fiscal indicators could be supplemented by disclosures on the European government sector. Since it is based on what currently appear to be plausible assumptions for the European level, the expected magnitude can be visualised for particularly relevant indicators.

Allocate European debt to Member States

Debt at the European level is ultimately the responsibility of the Member States. For instance, they underwrite the debt, commit to servicing that debt through contributions to the EU budget, or stand ready to inject additional capital into the ESM. For these reasons, European debt should be taken into account for analytical purposes; depending on the issue being

Established statistical reporting system ...

... would need to be supplemented by data for the European level

Allocation creates transparency

Report and allocate European debt as a supplementary disclosure item

analysed, it may also make sense to allocate them proportionally to the individual Member States.⁷

Allocate existing and ...

This applies to the EU debt already accumulated by end-2019,⁸ which came to just over €50 billion and is linked to balance of payments assistance to non-euro area countries, assistance from the European Financial Stabilisation Mechanism (EFSM) established during the financial and debt crisis, and financial aid to third countries. This is topped off by debt of just over €110 billion from the ESM (end-2019) which was used to grant assistance loans to euro area countries.⁹

... new European debt ...

Another point is that, according to current budget plans, European debt is set to rise sharply this year and in the years thereafter.

- By the end of October, the European Commission had already borrowed €17 billion for the SURE programme. This figure could come to €30 billion by the end of the year, and the total volume of €100 billion could be disbursed by the end of 2021.
- With regard to NGEU assistance loans, the 18 Member States that have applied for SURE assistance loans to date could conceivably also take out NGEU loans to the largest extent permitted (6.8% of national GDP). Most of the maximum volume of €360 billion (at 2018 prices) would thus be taken up. It could be distributed according to a schedule similar to that for the NGEU grants.
- The payment of the NGEU grants and the associated debt (around €390 billion at 2018 prices) will depend on how the national plans are implemented. The European Commission had assumed that outflows would rise fairly continuously until 2024 before falling again rapidly (see the chart above).¹⁰
- With regard to the timeline of the NGEU programme the planned annual price adjustment of 2% should be taken into account

NGEU* grant payments: possible time profile

As a percentage of total resources

* Next Generation EU.
Deutsche Bundesbank

(for more information, see footnote 5). By the end of 2026, this would culminate in a total volume of debt of just over €820 billion at current prices.

- As ESM credit lines have not yet been used to finance COVID-19 response measures, the analysis does not include any additional European debt stemming from this.

⁷ The Maastricht debt level is a gross figure and also reports debt which is matched by financial assets. Financial assets can be included in more in-depth analyses. For European debt, these would be European financial assets (such as claims on Member States).

⁸ The debts from the European Financial Stability Facility (EFSF) are attributed to the Member States. For the purposes of the national accounts, it is assumed that EFSF loans are not granted by the EFSF, but by the Member States. Equally, it is assumed that Member States will refinance themselves via loans from the EFSF. In this way, the debts from the EFSF are already captured in the Member States' national debt.

⁹ The recipient countries' debts vis-à-vis the ESM amount to €90 billion.

¹⁰ The European Commission outlined the potential timeline for the disbursement of the Recovery and Resilience Facility (RRF) grants in its proposal of May 2020. By contrast, this article assumes that 10% (rather than just under 6%) of the grants will be up and running in 2021, and that all grants will be disbursed to the Member States by the end of 2026 (rather than 2028), which is what the European Council had agreed. See European Commission (2020a), p. 40, and Council of the European Union (2020), p. 9 and p. 11. No information is available about the envisaged timeline for the non-RRF grants. For the purposes of the calculations performed in this article, they are distributed according to the same schedule as the RRF grants. The country shares expected by the European Commission sometimes differ from the share for RRF grants. See European Commission (2020b, 2020c, 2020d).

... to Member States according to GNI share

To allocate this European debt to the Member States for analytical purposes, a distribution key first needs to be established. In terms of EU debt, a country's share of financing in the EU budgets is a key factor. It is likely to remain broadly the same as a country's share of EU gross national income (GNI).¹¹ According to this, around one-quarter of European debt would be allocated to Germany. In the scenario described above, by 2026, this would amount to more than €280 billion, or around 8% of GDP of the year 2019 (including the ESM).¹²

Allocate European deficits to Member States

European deficits and surpluses should likewise be allocated to the Member States for greater transparency

Deficits at the European level create a definite – rather than just a potential – future burden for Member States. It is therefore particularly important to take these into account when interpreting national indicators. This can be demonstrated using an illustrative example. The EU could borrow 10% of EU GDP and use these funds to disburse equally tranching grants to Member States over a period of four years. This would reduce their national deficits in each of these four years by around 2½% of their GDP. A glance at the national indicators alone would overstate the fiscal situation for this period. Although the deficits would have been shifted to a different level, this would not ease the burden on taxpayers. Shifts such as this could also hollow out those fiscal rules that target the national indicators. This would be the case, for example, for the 3% ceiling on national budget deficits under the Stability and Growth Pact.¹³

Markedly higher deficit ratios at times, owing to allocating burdens from NGEU grants

Specifically, because of the NGEU grants (according to the assumptions outlined above), deficits of around €430 billion or 3% of EU GDP of the year 2019 are planned at the European level.¹⁴ The deficit would be highest in 2024, at over €110 billion, or 0.8% of GDP of the year 2019. In turn, each Member State would then be allocated around 0.8% of the relevant GDP figure, according to its share of funding in the EU budget.¹⁵ Around €30 billion

would be allocated to Germany in 2024, for example.

Measure fiscal stance more accurately

Besides the deficit and the debt level, the fiscal stance is an indicator that is commonly used in analyses.¹⁶ It is designed to show whether fiscal policy in a given year has been eased or tightened compared to the year before. It is often measured as the annual change in the cyclically adjusted primary balance,¹⁷ which is the fiscal balance (deficit or surplus) excluding interest expenditure and cyclical influences.

The fiscal stance ...

¹¹ Deviations from this are the result of agreed contribution rebates. See Deutsche Bundesbank (2020c). For the sake of simplicity, these will be disregarded below. The financing shares could well change in the future, for instance in connection with the introduction of a new tax harmonised across the EU. With regard to ESM debt, the current ESM capital key of the euro area Member States would apply. This is based primarily on a country's share of euro area GDP. Population size and special clauses are also taken into account. See ESM (2020).

¹² As usual, the allocated NGEU debt is expressed over GDP, while the distribution key is based on GNI. On balance, however, the ratios are largely identical for most countries. As is the case for the Maastricht debt level, the calculations here refer to gross debt. However, it should be borne in mind that some countries are in receipt of assistance loans that are included in the national debt level and that capital has already been injected into the ESM. There are several ways to take this into account when fine-tuning the calculations.

¹³ In the repayment phase of EU debt (surplus at the European level), the budgetary rules would inversely oblige Member States to commit to a more frugal fiscal policy than would be the case when including the EU level.

¹⁴ There is no (marked) deficit in the ESM.

¹⁵ The actual ratio depends on the extent to which GDP differs from that of the base year 2019. Moreover, the results of some countries may differ (slightly) from the EU-wide figure. This is the case for Ireland, for instance. In the example figures selected, the deficit ratio rises by 0.2 percentage point less because Irish GDP is markedly higher than GNI.

¹⁶ See, for example, European Commission (2020e), p. 58, and European Fiscal Board (2020).

¹⁷ In other analyses, the fiscal stance is also measured as a change in the structural primary balance. This is calculated by excluding temporary policy measures as well as cyclical components and interest expenditure. In addition, both the change in the structural and in the cyclically adjusted primary balance ratio are often used as an indicator of fiscal consolidation or easing. In the European rules, this is measured by the change in the structural balance.

... is often used to assess the impulse from fiscal policy

The fiscal stance is also interpreted as an impulse which emanates from fiscal policy to macroeconomic developments. The term “expansionary fiscal policy” is used, for example, when the cyclically adjusted primary balance falls compared to the previous year. This happens, for instance, if cyclically adjusted primary expenditure rises faster than cyclically adjusted revenue. It is then assumed that fiscal policy stimulates economic activity. Conversely, a rise in the cyclically adjusted primary balance tends to have a dampening impact on the economy. It may be the result of tax increases or spending cuts, for example.

Special factors distort the indicator

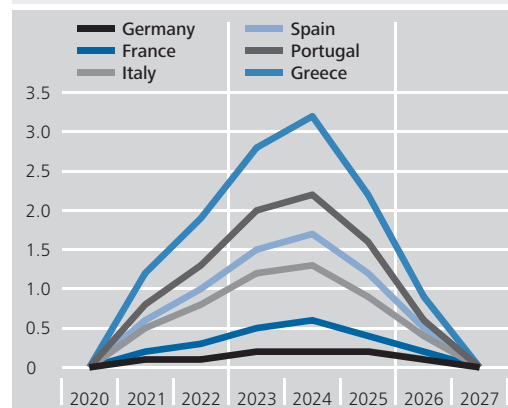

The indicator is calculated on the basis of the national accounts balances for the relevant years. In the case of NGEU grants, however, the resulting picture is distorted in terms of the cyclical impulse. If, for instance, a Member State receives large NGEU grants for the first time in 2021, this will increase the national balance compared with the previous year (revenue and expenditure being otherwise unchanged). This means that the cyclically adjusted primary balance in 2021 will also be higher than in 2020, and the fiscal stance for 2021 is measured as being restrictive. However, the grants received from abroad (the EU) do not have a dampening effect on national economic activity. This is because no domestic resources are withdrawn, as would be the case, for instance, if higher government revenue were the result of an income tax hike. If the NGEU grants decrease over time, national deficits will increase in themselves without triggering an expansionary stimulus.

NGEU grants should be disregarded, ...

If the fiscal stance is to indicate how fiscal policy stimulates the domestic economy, the logical next step would be to exclude the NGEU grants received. For some countries, the difference from the unadjusted figure may be considerable in some years. For example, the fiscal stance for Greece in 2021 – based on the above-mentioned assumptions (see the chart on p. 41) – is looser by around 1% of GDP after NGEU grants have been deducted. The corres-

Expected NGEU* grants to Member States

As a percentage of each country's national GDP in 2019

* Next Generation EU.
 Deutsche Bundesbank

ponding figure for Germany, which is expected to receive relatively small grants, would amount to just 0.1% of GDP. For the euro area as a whole (like in the EU), the fiscal stance would therefore be 0.3 percentage point looser than in the absence of adjustment for the aggregated national balances.

Obtaining the best possible indicator of the fiscal stance as an economic stimulus is not achieved solely by adjusting for NGEU grants. Member States’ other financial relationships with the European level can also skew the fiscal stance indicator. This is the case if a Member State’s net position with regard to the EU budget fluctuates strongly from year to year. In the past, this has been fairly significant for some Member States. In view of this, adjustments would have to be made not only for NGEU grants received, but also for all revenue and expenditure vis-à-vis the EU budget.

An even more extensive and accurate approach would be to adjust for all the revenue and expenditure flows of the country in question with the rest of the world. However, fluctuations beyond those in connection with the EU budget are often likely to be rather small. To reliably gauge the impact of public finances on economic activity, numerous additional factors would also have to be taken into account;

... as should countries' financial relations with the EU budget overall ...

... and with the rest of the world as a whole

“Fiscal stance” as an indicator of the fiscal impulse on economic developments

Definition and usage

The impact of fiscal policy on macroeconomic developments is a topic of interest for economic policy. An indicator often used for the fiscal impulse is the change in the cyclically adjusted primary balance of general government (as defined in the national accounts). Automatic stabilisers (cyclically induced balances) and government interest expenditure are factored out of the general government fiscal balance in the cyclically adjusted primary balance.¹ The change in the cyclically adjusted primary balance is also known as the “fiscal stance”. If the relevant government revenue falls, or if expenditure rises, the balance decreases, all else being equal. According to this definition, the fiscal stance would then be described as “expansionary” or “loose”. The opposite developments would be described as “restrictive” or “tight”. This indicator is frequently used for fiscal policy analysis, which also forms the basis for policy recommendations.

From an analytical perspective, the fiscal stance is an indicator that provides an initial approximation, relative to the previous year, of the impulse of government finances on overall economic developments. However, the concrete macroeconomic repercussions of this impulse can only be estimated with a considerable degree of uncertainty. Amongst other things, they depend on which government revenue and expenditure categories change as well as on the circumstances. Furthermore, the cyclical development of the government budget deducted from the indicator can be evaluated differently depending on the estimation method used. In times of heightened uncertainty in particular – such as the ongoing coronavirus crisis – this can result in significant differences with regard to the fiscal stance indicated for a given country.

Impact on gross domestic product dependent on a variety of factors:

Underlying categories of revenue and expenditure

Identical changes in different categories of general government revenue and expenditure can have different effects on macroeconomic developments. Most analyses, for example, come to the conclusion that increases in government expenditure generally provide greater stimulus to the economy than tax cuts of the equivalent volume.² Fiscal policy can therefore have an impact on gross domestic product (GDP) even if the fiscal stance indicator reports neutrality.

In this context, the impact of individual categories is often subject to debate. The estimation is dependent on both the exact specifications of the analyses and the prevailing circumstances. For example, it is difficult to gauge how assistance for banks or for enterprises that were closed for a time due to the pandemic stabilises economic activity over the short term.

By contrast, payment flows with other countries mostly have a minimal impact on domestic economic developments. A strong

¹ To a large extent, the fiscal stance is a reflection of measures actively taken by general government (such as tax increases or expansions in investment). For this reason, it is often seen as a yardstick for the active loosening or tightening of fiscal policy. However, other influencing factors can also shape the fiscal stance (such as rising pension expenditure due to a growing number of pensioners). The fiscal stance also captures temporary factors that only have an impact on the balances for a limited period of time. These may include fiscal policy measures (e.g. a one-off child bonus) as well as factors outside the control of fiscal policy, such as tax refunds as a result of court rulings. Temporary influencing factors have neither a positive nor negative impact on the fiscal outlook over the long term. Instead, their impact on macroeconomic developments depends on the specific circumstances in each case.

² See Gechert (2015).

case can be made, then, for adjusting the fiscal stance indicator for these payment flows if they fluctuate significantly over time (see also p. 46).

Timing inconsistencies

Timing inconsistencies also play a key role in the impact of fiscal policy on GDP. For instance, a fiscal policy impulse occurring today often influences macroeconomic developments only after a certain amount of time. A reduction in income tax could, for example, be reflected in a lagged response of private consumption – especially if consumers are initially uncertain about their individual relief. On the other hand, the impulse could also take effect before the payment flows, for example if enterprises are provided with more generous depreciation allowances.

Cyclical conditions

Depending on the underlying cyclical conditions, a fiscal policy impulse can have different effects. For example, it is generally likely to have a stronger impact on real GDP if production capacity is not fully utilised. In the event of overutilisation, by contrast, a fiscal policy impulse would instead lead more to price inflation than to greater real growth. The monetary policy response is also important: in general, an opposing reaction is often likely (given a non-binding zero lower bound on interest rates), as an expansionary fiscal policy impulse causes inflation to rise, all else being equal. If this dampening effect does not materialise, the fiscal policy impulse has a stronger impact.

Other underlying economic conditions

In addition, other, country-specific factors can have an influence on the impact of a fiscal policy impulse.³ For example, an expansionary impulse will probably be less effective if government solvency is subject to doubt. Under such circumstances, private investment, amongst other things, is hindered by

potentially rising risk premia that spill over into the private sector as well as by heightened uncertainty overall.⁴ An economy with a high import ratio would also be likely to show a weaker response to a fiscal policy impulse than a more closed economy. Furthermore, propensity to save among the general public influences the effects of the impulse. For example, for populations with high saving ratios, additional disposable income resulting from an expansionary impulse only leads to a limited rise in consumption.

Formation of expectations

Last but not least, expectations play a role. Amongst other things, these are influenced by communication. For example, if the announcement that a reduction in value added tax will be limited in time is considered credible, households will expect prices to rise again at a later point in time and bring their consumption forward accordingly. However, if new government borrowing is interpreted primarily as an indication that the future tax burden will be heavier, an intended expansionary impact can fizzle out in the form of additional private saving.

Conclusion: Indicator should be interpreted with a high degree of caution

The “fiscal stance” indicator provides a broad impression of the impulses of fiscal policy on short-term economic developments. The informative value of the indicator can be improved by adjusting it for categories of revenue and expenditure that fluctuate more strongly and that clearly have only a limited influence on the economy. These can include general government payments to and from abroad. Beyond this, however, the impact of fiscal policy on macroeconomic developments still depends on a number of additional factors. The indicator should therefore be interpreted with caution.

³ See Ilzetzki et al. (2013).

⁴ See Blanchard and Zettelmeyer (2018).

however, this would, for its part, increase computational complexity. In any case, the fiscal stance indicator should generally be interpreted with caution (see the box on pp. 44 f.).

■ Conclusion

*Extensive Euro-
pean debt ...*

Fiscal policy has been playing a significant stabilising role during the coronavirus crisis. Besides national measures, European assistance mechanisms have been set up at the price of accumulating large-scale European debt and deficits. These are not usually envisaged, and are therefore also only intended to be temporary.

*... should be
taken into
account in fiscal
analyses*

The new dimension which European debt and deficits have taken on means that they need to be taken into account in fiscal analyses. Existing national indicators (such as the Maastricht deficit or Maastricht debt) do not capture European debt and deficits and will therefore no longer be fit for purpose in the future. This presents a number of risks, one being that the

resulting burdens might go unnoticed. That could increase the incentive to shift ever more debt from the national level to the European level, and propensity to borrow could increase.

In terms of fiscal and economic policy analysis, it is important for government activities at the European level to be statistically recorded in a comprehensible manner using relevant national accounts data. This has not been the case so far and should form part of the final decisions. One priority should be timely disclosure of the Maastricht debt and fiscal balance at the European level. This would allow European deficits and debt to be allocated to the Member States for the purposes of economic and fiscal policy analysis. They should also be taken into account in the fiscal rules. Moreover, the fiscal stance indicators for the Member States and the EU aggregate as well as for the euro area as a whole could be compiled and presented in a more suitable manner. This would place associated policy recommendations on a sounder footing, for example.

*Transparency
and statistical
reporting are
vital*

Risk Reduction Act – the national implementation of the European banking package

The European banking package contains further essential regulatory provisions designed to eradicate the regulatory gaps and deficiencies identified in the aftermath of the financial crisis and to buttress the resilience of the European banking sector overall. It is precisely in times such as the current COVID-19 pandemic where stringent regulation pays off because institutions with a sound capital base are better able to withstand the capital burden imposed by the pandemic. Within the broader context of the advancement of the banking union, the banking package should be regarded as a further measure to reduce risks in the banking sector. The banking package also envisages administrative relief for small, non-complex institutions without exempting them from quantitative requirements – a development which the Bundesbank had a major role in driving forward and, given the growing complexity of banking regulation and the increasing cost of compliance, an important step towards proportionate and targeted regulation.

The Risk Reduction Act (Risikoreduzierungs-gesetz) complements directly applicable European provisions by transposing into German law the provisions of the Capital Requirements Directive (CRDV) and the Bank Recovery and Resolution Directive (BRRD II) contained in the banking package. This has necessitated amendments not only to national legislation but also to national statutory orders. Implementation in the Risk Reduction Act is guided by European standards, which, in keeping with the spirit of broad harmonisation within the European Union (EU), leaves little to no discretionary scope. This approach should be welcomed as a move to create a level playing field within the EU. The discretionary scope was utilised only with respect to the unique features of the German banking market and to the extent explicitly granted to Member States. The fact that German legislators used the scope afforded via the Risk Reduction Act to incorporate relief for factoring and financial leasing institutions appears appropriate against the backdrop of the general debate on proportionality.

Though the banking package and its transposition by way of the Risk Reduction Act represent the regulatory implementation of further key elements of the Basel III framework in the EU and national legislation, it is still not the final item on the post-financial-crisis agenda. One final piece of the jigsaw puzzle is implementation of the package of Basel III reforms from the end of 2017, even if the timeline has been moved back one year owing to the COVID-19 pandemic. Irrespective of the delay, it is important that these standards be implemented consistently and fully. In keeping with the spirit of reliable multilateral cooperation, the current turmoil caused by COVID-19 should not be used to water down the agreed standards during the implementation process. This would tilt the global playing field and thus create undesirable regulatory arbitrage opportunities. At the European level, the key is to adhere to the agenda of further risk reduction. This includes not only the regulatory treatment of sovereign bonds but also the actual achievement of the target requirements for sufficient loss-absorbing capacity available in a resolution event.

■ Introduction

What is known as the “banking package” was promulgated in the Official Journal of the European Union on 7 June 2019.¹ The banking package is a further key step towards eradicating the regulatory gaps and weaknesses identified in the financial crisis with the goal of strengthening the resilience and stability of the European banking sector. It therefore encompasses numerous amendments to the Capital Requirements Regulation (CRR),² the Capital Requirements Directive (CRD),³ the Bank Recovery and Resolution Directive (BRRD)⁴ and the Single Resolution Mechanism Regulation (SRMR).^{5,6} Whereas the amended EU regulations (CRR and SRMR) are directly applicable in the EU Member States, the directives (CRD and BRRD) first need to be transposed into national law. In Germany, this is being accomplished through the Risk Reduction Act (*Risikoreduzierungs-gesetz*),⁷ most of which will enter into force at the end of 2020.⁸

The Risk Reduction Act is an omnibus act and envisages, in particular, amendments to the Banking Act (*Kreditwesengesetz*) and the Act on the Recovery and Resolution of Institutions and Financial Groups (*Gesetz zur Sanierung und Abwicklung von Instituten und Finanzgruppen*). Alongside the necessary implementation of EU requirements, further amendments which appeared appropriate in terms of timing and subject matter are also included.

■ Key amendments to the Banking Act

Approval requirement for (mixed) financial holding companies

Financial holding companies⁹ and mixed financial holding companies¹⁰ can be parents of banking groups for which the application of supervisory requirements at the consolidated level is mandatory. However, the supervised in-

stitutions controlled by such a holding company cannot always ensure compliance with the requirements at the consolidated level throughout the group. Therefore, the new Section 2f of the Banking Act¹¹ introduces an approval requirement for (mixed) (EU) parent financial holding companies of a group responsible for meeting prudential requirements at the group level, whilst at the same time an obligation is imposed on the (mixed) financial holding company itself to ensure compliance with prudential requirements on a consolidated basis. Section 2f of the Banking Act transposes the European provision set out in Article 21a of CRD V. The new rule also defines the information and documentation to be submitted to the consolidating supervisor, i.e. the competent authority for the group under the approval procedure. The use of the term “competent authority” here and elsewhere in the Banking Act illustrates that the authority can be either the ECB or the Federal Financial Supervisory Authority (BaFin). For approval to be granted, it is necessary, in particular, for the internal arrangements and distribution of tasks within the group to be adequate for the purpose of complying with the Banking Act and CRR on a consolidated or sub-consolidated basis and to be effective to coordinate all subsidiaries, prevent conflicts and enforce policies set by the parent throughout the group. The competent author-

³ Directive (EU) 2019/878 of 20 May 2019 amending Directive 2013/36/EU (CRD V).

⁴ Directive (EU) 2019/879 of 20 May 2019 amending Directive 2014/59/EU (BRRD II).

⁵ Regulation (EU) 2019/877 of 20 May 2019 amending Regulation (EU) No 806/2014 (SRMR II).

⁶ See Deutsche Bundesbank (2019).

⁷ See <http://dipbt.bundestag.de/extrakt/ba/WP19/2656/265687.html>. Promulgation in the Federal Law Gazette is scheduled for 14 December 2020.

⁸ Under EU law, the amended provisions of the BRRD have to be applied nationally as from 28 December 2020; the amendments necessitated by the CRD are applicable beginning on 29 December 2020.

⁹ See Article 4(1) point (20) of CRR.

¹⁰ See Article 4(1) point (21) of CRR.

¹¹ Any and all citations of sections of the Banking Act refer to the version as already amended by the Risk Reduction Act.

ity must notify the applicant of the decision to grant or refuse approval within six months of receipt of the application.

There are individual cases in which approval is not necessary, if, amongst other things, the financial holding company's principal activity is to acquire and maintain holdings in subsidiaries and a CRR credit institution is responsible for ensuring compliance with prudential requirements on a consolidated basis. The competent authority shall monitor compliance with the criteria for approval or exemption on an ongoing basis.

Responsibility for supervision on a consolidated basis

New rules governing responsibility for consolidated supervision

As a complement to the introduction of an approval requirement for (mixed) financial holding companies, the new Section 8b of the Banking Act, which transposes Article 111 of CRDV into German law, reorganises responsibilities for the supervision of groups of institutions or financial holding groups on a consolidated basis. The reorganisation of supervisory responsibilities at the European level will enhance the role of banking supervision relative to securities supervision. In future, once a group contains at least one credit institution, the competent authority for banking supervision is always to assume responsibility for the consolidated supervision of that group. In addition, the new rules increasingly allocate responsibility for consolidated supervision to the competent authority that supervises, at an individual level, the largest part of the group in terms of total assets. It is therefore possible that, going forward, the competent authority which supervises the consolidating entity as defined in Section 10 of the Banking Act¹² will no longer automatically be responsible for consolidated supervision, either. Nonetheless, Section 8c of the Banking Act allows the competent authorities, in particular cases and by common agreement, to deviate from the assignment of responsibility prescribed by law.

Establishment of an intermediate EU parent undertaking in the case of third-country parent undertakings

Section 2g of the Banking Act introduces a requirement that certain third-country banking groups¹³ establish an intermediate EU parent undertaking (IPU). This requirement covers third-country banking groups that have at least two subsidiary institutions established in the EU and whose assets (including those of legally dependent branches) within the EU exceed a threshold of €40 billion. The activities of all EU subsidiary institutions of the third-country banking group are to be supervised on a consolidated basis under this newly established IPU in the EU. The objective is to make it easier to supervise third-country banking groups in the EU as well as to potentially apply resolution regimes to their EU activities.

New requirement for certain third-country banking groups to set up an IPU

On a case-by-case basis, supervisors may approve structures with two IPUs. This would be possible, in particular, in those cases where the establishment of a single IPU would violate the third country's ringfencing rules¹⁴ or if the resolution authorities believe that consolidation of all business activities under a single intermediate EU parent would impair resolvability. For those third-country banking groups which, as at 27 June 2019, had been represented by more than one institution in the EU and whose assets within the EU as at that date exceeded €40 billion, the Banking Act provides for an extended transition period ending on 30 December 2023. All other affected third-country banking groups must implement the require-

¹² Pursuant to Section 10a of the Banking Act read in conjunction with Article 11 of CRR, the parent institution or the parent financial holding company (where approved pursuant to Section 2f of the Banking Act) is responsible for compliance with the prudential requirements at the group level. If the parent financial holding company of a (sub-) group has not been approved, a subordinated institution must be accordingly designated as the responsible institution instead.

¹³ If the group's head office is outside the European Economic Area (EEA).

¹⁴ Generally understood as the requirement that risky business areas be separated from deposit business.

Introduction of a standard definition of the term “significant institution” in the Banking Act for the purposes of remuneration and corporate governance

For the purposes of regulating remuneration and in connection with the requirements set out in Sections 25c and 25d of the Banking Act (*Kreditwesengesetz*) for management bodies and administrative or supervisory bodies, a standard definition of the term “significant institution” is being introduced in Section 1(3c) of the Banking Act. According to this definition, an institution shall be significant if its total assets exceed €15 billion on average over the respective reporting dates of the preceding four completed financial years. Furthermore, pursuant to Section 1(3c) of the Banking Act, the following institutions shall always be deemed to be significant:

- institutions which meet one of the conditions pursuant to Article 6(4) subparagraph 2 of the SSM Regulation;^{1,2}
- institutions categorised as having the potential to pose a systemic threat within the meaning of Section 12 of the Banking Act;
- financial trading institutions within the meaning of Section 25f(1) of the Banking Act.

¹ Single Supervisory Mechanism, Regulation (EU) No 1024/2013 of 15 October 2013.

² This stipulates that an institution is considered significant if, first, the total value of its assets exceeds €30 billion; second, the ratio of its total assets over national GDP exceeds 20% (only applies where the total value of an institution’s assets exceeds €5 billion); or third, following a notification by its national competent authority that it considers such an institution of significant relevance with regard to the domestic economy, the ECB takes a decision confirming such significance.

ment when the national implementation enters into force on 29 December 2020.

Pillar 2

CRDV clarified a number of points relating to the supervisory review and evaluation process (SREP) as well as the supervisory measures based on it. These have been carried over to the Banking Act via the Risk Reduction Act.

Expanded SREP rules, additional own funds requirements and guidance on additional own funds adopted wholesale from CRDV

The expanded rules governing the additional own funds requirements (Pillar 2 requirement, or P2R) have been consolidated in Section 6c of the Banking Act, which also contains the new rule on the quality of the own funds needed to meet the additional own funds requirements. Under the new rules, this capital requirement – in keeping with the minimum capital requirements under Pillar 1 – no longer has to be met exclusively with common equity tier 1 (CET1) capital.

The basis for the guidance on additional own funds (Pillar 2 guidance, or P2G) is transposed by Section 6d of the Banking Act. This additional capital buffer is intended to allow institutions to cover losses incurred in day-to-day business operations during stress periods – one example being the current COVID-19 situation – without breaching prudential minimum capital requirements. In order for this stress buffer to function properly, it makes sense to meet this guidance on additional own funds using CET1 capital.

For the majority of German institutions, interest rate risk in the banking book (IRRBB) is the most significant risk for which there is no provision for own funds requirements under Pillar 1. In line with the European requirement, two indicators are being introduced for assessing the materiality and, thus, the necessity of additional own funds requirements for IRRBB. Accordingly, interest rate risk is regarded as material, in particular, if there is a decline in the economic value of equity of more than 15% of

EBA to give more detailed guidance on IRRBB

Supervision of promotional banks

Since the entry into force of the Capital Requirements Regulation (CRR) II on 27 June 2019, Germany's 14 legally independent promotional banks have no longer been CRR credit institutions. By virtue of the amendment to Article 2(5) point (5) of the Capital Requirements Directive (CRD) in CRDV, they have been specifically exempted from the scope of EU banking regulation. For this reason, they have since returned to supervision at a solely national level, i.e. by the Federal Financial Supervisory Authority (BaFin) and the Bundesbank. As they are no longer CRR credit institutions, they also no longer fall within the scope of the Single Supervisory Mechanism (SSM) and are therefore no longer subject to supervision under the SSM. There was no immediate need for German legislators to act, given that the promotional banks concerned are credit institutions within the meaning of the Banking Act (*Kreditwesengesetz*). The European supervisory rules, first and foremost the CRR and CRD, still generally apply to these credit institutions via a reference to that effect in Section 1a of the Banking Act. The Risk Reduction Act (*Risikoreduzierungs-gesetz*) stipulates that the reporting requirements set out in the ECB Regulation on the reporting of supervisory financial information¹ also apply to promotional banks as non-CRR credit institutions. Additionally, the insertion of Section 12 of the Banking Act ensures that these promotional banks can also be classified as institutions posing a potential systemic threat (PSIs). An institution's significance relative to the population

of all institutions in Germany is used as the basis for assessing its systemic importance. The new Section 12 of the Banking Act makes it possible for promotional banks to be taken into account as part of the population for determining the systemic importance of institutions in Germany in the context of the methodology applied by BaFin and the Bundesbank (PSI method).

In the area of remuneration regulation, a different balance sheet threshold applies to promotional institutions with respect to their classification as significant institutions: they are only considered significant if the total value of their assets exceeds €70 billion.² Only then do they have to comply with the special requirements of the Remuneration Regulation for Institutions (*Insti-*

¹ Regulation (EU) No 2015/534 of 17 March 2015, as amended by Regulation (EU) No 2020/605 of 9 April 2020.

² On average over the respective reporting dates of the preceding four financial years. As a general rule, a threshold of €15 billion applies pursuant to Section 1(3c) of the Banking Act.

* See Article 2(5) point (5) of CRDV; the KfW banking group (Kreditanstalt für Wiederaufbau) was already exempted from the scope of EU banking regulation prior to the entry into force of CRDV.

tutsvergütungsverordnung), whereas promotional banks with total assets below this value still only have to meet the general requirements. As a result, the regulation of remuneration for promotional banks that has so far effectively been in place will continue.

Under the Risk Reduction Act, the Banking Act will now exempt promotional banks from disclosure requirements. The main reason for this is presumably that the decisive factor for buyers of financial instruments when making their purchases is likely to primarily be the explicit guarantee provided by the public sector rather than the promotional bank's risk assessment. The market-disciplining effect induced by disclosure would thus be redundant.

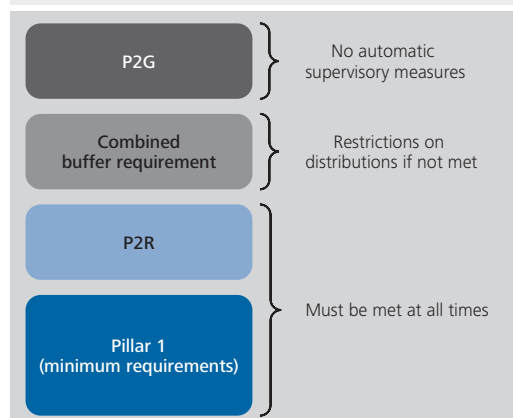

Overall, it is a welcome development that promotional banks will continue to be sub-

ject to a level of supervision comparable to the one provided under EU banking supervision law. Moreover, the basic approach of the Banking Act, according to which all credit institutions within the meaning of the Banking Act are subject to the same rules, is not being called into question.

Tier 1 capital in any of the six supervisory interest rate shock scenarios or a large decline in net interest income in any of the two supervisory scenarios.

How these indicators are going to work in practice will be enshrined in regulatory technical standards (RTS), which are mandated by CRDV and are yet to be drawn up by the European Banking Authority (EBA). This challenging work for the EBA involving, for example, the development of an earnings-based indicator that breaks new ground in regulatory terms, will therefore not be completed before 2022. Owing to the fact that the provision in the Banking Act is linked to the new indicators and the RTS, these requirements of the Banking Act will not yet be applied until the RTS enter into force after they are adopted in the form of a Regulation by the European Commission.

Stacking order of the various capital requirements

The Bundesbank welcomes the introduction of supervisory indicators covering both an economic value and earnings-based perspective along the lines of the Minimum Requirements for Risk Management (MaRisk). Regulatory ratios can give no more than an indication of the risk at an individual institution, however.

No automatic application of additional own funds requirements for IRRBB

Therefore, a positive feature to be highlighted is that there is no provision for an automatic link between overstepping the indicators' threshold values and additional own funds requirements. Seen in that light, decisions on additional own funds requirements for IRRBB will continue to be made with due consideration given to institution-specific aspects.

Leverage ratio

National implementation of the additional requirements of the leverage ratio framework

The Pillar 2 framework for an institution-specific risk-based capital requirement is now also being applied to the non-risk-weighted leverage ratio. As the European requirements do not provide for any explicit national discretionary leeway for legislators regarding the new requirements for the leverage ratio, their implementation in the Banking Act will closely follow the wording of the European regulations.

Introduction of the possibility of a supplementary own funds requirement and of own funds guidance

One particular feature to be highlighted is that there will be supervisory discretion with the possibility – mirroring the risk-based framework – of supplementing the 3% minimum requirement for the leverage ratio (LR) under Pillar 1¹⁵ – which will be binding as of 28 June 2021 – with additional own funds requirements and guidance. The additional own funds requirement (LR Pillar 2 requirement, or LR-P2R) is calculated by the supervisory authorities as part of the SREP for an individual institution especially for uncovered or inadequately covered risks arising from excessive leverage. By contrast, the own funds guidance (LR Pillar 2 guidance, or LR-P2G) is calculated on the basis of supervisory stress tests. This additional own funds guidance is designed to enable institutions to cover losses in crisis situations without first eating into other own funds items. Like the requirements of CRDV, national legislation, too, envisages that own funds used to meet LR-P2R and LR-P2G cannot be used to fulfil other leverage ratio own funds requirements.

Another key change is the introduction of more detailed requirements regarding the application

of the leverage ratio buffer. This buffer is to be maintained by global systemically important institutions (G-SIIs) from 2023 and amounts to 50% of the risk-based G-SII capital buffer.¹⁶ In particular, the national legislation will, in future, contain requirements regarding the (restricted) permissibility of distributions if the buffer requirement is not fulfilled, with the details being regulated by statutory order (Solvency Regulation – *Solvabilitätsverordnung*). Furthermore, for cases where the buffer requirement is not fulfilled, the Banking Act will contain provisions with regard to the necessity of and procedure for preparing a capital conservation plan that is intended to ensure (renewed) compliance with the requirement within an appropriate time period.

Constraints when under-shooting the LR buffer for G-SIIs

The wholesale transposition of the CRDV requirements into national law finalises the implementation of the LR framework as a backstop for the risk-based framework at the national level, too. The elements which this introduces are to be welcomed from a supervisory perspective, as they create consistency with the existing regulatory possibility of setting targeted own funds requirements or guidance for an individual institution in the risk-based framework. Seen in that light, they incorporate a tried and tested concept into the non-risk-based framework.

Final implementation of the supplementary requirements of the LR framework

Exclusion rules on the use of CET1 capital

In fulfilling a capital buffer requirement, institutions are not allowed to use any CET1 capital that is needed to back other risk-based capital requirements, such as the minimum capital requirements and bank-specific add-ons or one of the other capital buffers. This provision is

Exclusion rules regarding the backing of the capital buffers will be regulated centrally in future

¹⁵ This ratio is calculated as the ratio of a bank's regulatory Tier 1 capital (numerator) and its total exposure measure, essentially comprising all balance sheet and off-balance-sheet items (denominator).

¹⁶ For instance, if the risk-weighted G-SII buffer is 1%, the corresponding LR buffer amounts to 0.5% of the total exposure measure.

now regulated centrally in the new Section 10b of the Banking Act. This incorporates a technical amendment from CRDV which merges the individual provisions concerning the capital buffers and places them in a central position. Listing the relevant capital requirements in Section 10b of the Banking Act does not imply a sequence or “stacking order” in which the individual requirements are to be fulfilled. Rather, it makes clear that there must be no multiple use of CET1 capital to back risk-based capital requirements.

Amendment of provisions relating to loans to related parties

Additional provisions governing loans to related parties based on Basel principles and EU requirements

The changes in the provisions relating to loans to related parties in Section 15 of the Banking Act are due to an amendment of Article 88(1) of CRD and to the Basel Core Principles for Effective Banking Supervision.¹⁷ In line with the amended European provisions, there is now a wider group of persons to whom the special decision-making requirements pursuant to Section 15 of the Banking Act are applicable. In future, loans to a parent or the adult children of a member of the management board or of the supervisory board will also require approval from the management board and the supervisory board of the institution. This amendment originates from the Basel Core Principles for Effective Banking Supervision, according to which adult children and parents are also to be understood as “close family members”. Furthermore, as part of its 2016 Financial Sector Assessment Program (FSAP) of Germany, the International Monetary Fund made the criticism that persons with potential conflicts of interest were not excluded from decision-making on granting related party loans. Furthermore, the Fund maintained that the existing provisions of Section 15 of the Banking Act were inadequate because they fail to take into account conflicts of interest that can arise in service contracts, asset purchases and sales, and construction contracts or the write-offs of exposures. These shortcom-

ings will be remedied with the Risk Reduction Act.

Remuneration

The new European regulations necessitate changes in the national remuneration rules, including in relation to the proportional application of specific remuneration requirements as well as the need for gender-neutral remuneration systems.

Proportionality: exemptions from ex post risk adjustment ...

The recast uniform definition of significant institutions in the Risk Reduction Act takes due account of the approach prescribed in CRDV, where institutions above a given balance sheet threshold may not be exempted from ex post risk adjustment.¹⁸ The European rules in this regard set a general proportionality threshold of €5 billion for total assets on a four-year average. In Germany, however, legislators have made full use of the option contained in CRDV which allows Member States to raise the threshold to up to €15 billion. From the Bundesbank’s perspective, this makes it possible to take due account of conditions in the German banking market.

At the same time, all CRR institutions now have to identify risk takers. So far, only significant CRR institutions have had to do this. Only “light-touch” risk taker identification is required of non-significant CRR institutions. This applies only to members of the management board and members of the administrative or supervisory board – who, by law, are necessarily categorised as risk takers – as well as certain other groups of employees in management pos-

... and “light-touch” risk taker identification

¹⁷ See https://www.bis.org/basel_framework/standard/BCP.htm

¹⁸ In CRDV, exemption from ex post risk adjustment explicitly covers the rules on the pro rata pay-out of variable remuneration in instruments as well as a pro rata deferral over a number of years. According to the draft amendment to the Remuneration Regulation for Institutions (*Institutsvergütungsverordnung*) published by BaFin, there is also to be an exemption with regard to the requirement for the ex post contraction of variable remuneration components through malus and clawback arrangements.

itions.¹⁹ The further, more detailed examination of additional criteria for identifying members of staff whose professional activities have a material impact on the risk profile pursuant to Delegated Regulation (EU) No 604/2014 as last amended²⁰ is to be performed only by significant institutions. For institutions which are not CRR institutions, no identification of risk takers is necessary, as hitherto, unless they are deemed to be significant.

Gender-neutral remuneration now enshrined in law

The principle of gender-neutral remuneration for members of the administrative or supervisory board is being incorporated in the new Section 25d(5) of the Banking Act. Remuneration reporting requirements will also be expanded to include information on the gender pay gap. Details of this will only be available after amendments of the relevant EBA Guidelines.

Supplementary amendment to Remuneration Regulation for Institutions required

In tandem with the implementation of the remuneration requirements in the Banking Act, amendments to the Remuneration Regulation for Institutions will be necessary. This concerns changes, for example, to the scope of application, the minimum length of the deferral period and the regulations for groups as well as the incorporation of the need for gender-neutral remuneration for employees and members of the management board.

Corporate governance

In the area of corporate governance, the implementation of the European banking package has brought clarification of certain points, granted relief measures and enshrined current supervisory practices in law.

Primary responsibility of the institutions

Under current law, the primary responsibility for both the initial and ongoing suitability of members of the management body already lies with the institutions. The Banking Act therefore now makes it clear that new facts which have a considerable impact on the initial “fit and proper” assessment also have to be notified by the institutions without undue delay as soon as

they become known. In the notification procedure for new members of the management board, the outcome of the “fit and proper” assessment is also to be communicated by the notifying reporting institution in future.

Furthermore, as a result of the Risk Reduction Act, the Banking Act stipulates that members of the management board should, collectively, possess an appropriately broad range of knowledge, skills and experience that allows them to understand the institution’s activities, including the main risks. As before, each individual member of the management board shall also have the knowledge, skills and experience necessary for fulfilling their respective tasks.

Collective suitability of the management board

Relief is provided for institutions at subordinated level within a group which, on an individual basis, do not meet the definition of a significant institution pursuant to Section 1(3c) of the Banking Act. Depending on the size, internal organisation and the nature, scope, complexity and riskiness of the institution’s activities, they can decide in future on (not) setting up the committees mentioned in the Banking Act.

Relief for institutions at subordinated level within a group in appointing committees

Further relief measures are envisaged with regard to the maximum number of directorships. For one thing, the existing narrow concept of a “group of institutions” will be brought into line with the newly introduced definition of a “group” in the CRR. This means that, in future, directorships can be added up and counted as a single directorship if they are exercised within a single group of undertakings, of which at least one is an institution and the other under-

Relief regarding the maximum number of directorships

¹⁹ See Section 1(21) of the Banking Act and Section 25a(5b) sentence 1 of the Banking Act.

²⁰ Commission Delegated Regulation (EU) No 604/2014 prescribes qualitative and quantitative criteria for determining risk takers at institutions. It was revised by the EBA in parallel with the national implementation of CRD V, sent to the European Commission and published (<https://eba.europa.eu/eba-publishes-revised-standards-identify-staff-material-impact-institution%E2%80%99s-risk-profile>). It will enter into force only upon adoption by the European Commission and subsequent publication in the Official Journal of the European Union.

takings belong to the same consolidated group. Furthermore, directorships as a member of the management board and as a member of the administrative or supervisory board within a group are not to be counted separately in future but together as a single management board directorship. As this brings the counting of directorships into line with the practice in other SSM Member States, this long due change is to be welcomed in terms of harmonisation. For members of the management body of German institutions, this amendment is also likely to make it considerably easier for them to hold directorships. However, an additional administrative or supervisory board directorship approved in an individual case by the supervisory authority may be accepted only after it has been approved.

*Further changes
in the area of
governance*

For the purpose of harmonisation within the SSM, a new legal basis is being created for interviews to assess the suitability criteria conducted by the supervisory authority.²¹ Furthermore, there is now an explicit legal basis for reprimanding members of the management board.²²

Transitional arrangement for securities trading firms

In the transitional provisions, Section 64(3) of the Banking Act now makes clear that what have thus far been referred to as securities trading firms, which, from 26 June 2021, will be subject to the prudential regime for investment firms,²³ will not be governed by the requirements of CRDV during the transitional period of six months following the entry into force of the Risk Reduction Act. With the exception of the requirement to set up an IPU under Section 2g of the Banking Act, the provisions of the Banking Act as last amended before the entry into force of the Risk Reduction Act shall continue to apply.

Further amendments to the Banking Act

The amendments relating to the macroprudential instruments represent a further essential component of CRDV and thus also of its national transposition into the Banking Act.²⁴ These instruments are now distinguished more clearly from the microprudential instruments; overlaps between the macroprudential buffers are being adjusted. Their implementation in Sections 10c to 10i of the Banking Act is in line with European requirements.

Furthermore, the Risk Reduction Act introduces a number of editorial changes required by the substance or context. For example, the wording of Section 45 of the Banking Act, which governs measures to improve the adequacy of own funds and liquidity, has been partly recast. This includes the clarification that the supervisory authority is able to take early measures to effectively avert a potential emergency situation. This is designed to define more clearly their difference from the early intervention measures contained in the Act on the Recovery and Resolution of Institutions and Financial Groups. The use of the term "supervisory authority" now also makes clear that the ECB is able to directly apply these powers under the Banking Act in relation to the German institutions which are under direct ECB supervision.

Accompanying amendments to existing statutory orders

To complete implementation of the EU banking package, amendments to national legislation must also be accompanied by changes to exist-

²¹ According to the ECB's Guide to fit and proper assessments, interviews will be conducted in the case of new appointments to the CEO (or equivalent) and Chair positions at stand-alone banks and the top banks of groups.

²² See Section 36(2) of the Banking Act.

²³ Regulation (EU) 2019/2033 and Directive (EU) 2019/2034 of 27 November 2019.

²⁴ See the detailed account in Deutsche Bundesbank (2019) pp. 40 and 42.

ing statutory orders, notably the Regulation Governing Large Exposures and Loans of €1 Million or More (*Großkredit- und Millionenkreditverordnung – GroMiKV*), the Solvency Regulation and the Remuneration Regulation for Institutions. In some cases, changes are necessitated as a direct result of CRR II or CRD V, and in other cases they are required as a consequence of amendments made to the Banking Act. For this reason, BaFin held public consultations on five pieces of draft amending regulations between 12 November 2020 and 4 December 2020.²⁵ Due to the later entry into force of the leverage ratio buffer with effect from 1 January 2023, it was deemed necessary to draft two separate amending regulations in each case for the Solvency Regulation and the Remuneration Regulation for Institutions. The Fourth Regulation Amending the Solvency Regulation separately transposes into national law details on the calculation of G-SIIs' maximum distributable amount, such amount depending on the degree to which the leverage ratio buffer requirement is met.

The regulation amending the Regulation Governing Large Exposures and Loans of €1 Million or More is scheduled to enter into force on 28 June 2021, and the other amending regulations²⁶ are not expected to enter into force this year either.

Adjustments to national bank resolution law

On the whole, the Risk Reduction Act's implementation of bank resolution law sticks very closely to the wording of BRRD II and thus also of SRMR.

Minimum requirement for own funds and eligible liabilities (MREL)

The new and stricter rules added to bank resolution law as a result of the banking package²⁷ and its national implementation through the Risk

Reduction Act will enhance the resolvability of institutions overall. This will be achieved primarily through the amended rules on creating sufficient loss-absorbing capacity in order to reduce the risk of institutions seeking public financial support.

Consistent with the TLAC standard,²⁸ a statutory minimum MREL requirement is being introduced for G-SIIs for which the calibration parameters are based on two variables: a risk-based ratio based on risk-weighted assets (RWAs) and the non-risk-based ratio based on the leverage ratio exposure measure (LRE). Moreover, European legislators have also decided to widen the group of banks to which a statutory minimum MREL requirement is applicable beyond G-SIIs to include "top-tier" banks. This new category of top-tier banks includes banks which are not G-SIIs but have total assets above €100 billion. In addition, the resolution authority can classify institutions with total assets lower than €100 billion as top-tier banks if it assesses them as posing a systemic risk in the event of their failure ("fishing option"). In addition, a further statutory minimum MREL requirement of 8% of total liabilities and own funds (TLOF) has been introduced for G-SIIs and top-tier banks, effective from January 2024. This ensures consistency with the BRRD requirement that losses totalling no less than 8% of TLOF shall be met by shareholders and subordinated creditors before losses can potentially be covered by the Single Resolution Fund (SRF).²⁹ For G-SIIs and top-tier banks, the statutory minimum MREL requirement should generally be met with subordinated MREL instruments.³⁰ For the other banks,

²⁵ See https://www.bafin.de/SharedDocs/Veroeffentlichungen/DE/Konsultation/2020/kon_15_20_Konsultation_Rechtsverordnungen_ba.html

²⁶ Draft Third Regulation Amending the Solvency Regulation and draft Third Regulation Amending the Remuneration Regulation for Institutions.

²⁷ See Deutsche Bundesbank (2019), pp. 43 ff.

²⁸ Total loss-absorbing capacity; see corresponding Basel Committee standard: <https://www.bis.org/fsi/summary/tlac.htm>

²⁹ The highest of the three requirements (RWA, LRE or TLOF) is binding on the bank.

³⁰ Alongside an institution's own funds, liabilities are only eligible if they are subordinated to certain other liabilities (e.g. deposits or derivatives).

Eased requirements for factoring and financial leasing institutions

Asset-leasing vehicles for multiple leased assets now join asset-leasing vehicles for single leased assets in being exempt from the authorisation requirement. These are undertakings whose only financial service is financial leasing where they act as asset-leasing vehicles for one or multiple leased assets of a single lessee. From a risk perspective, it is appropriate to subject asset-leasing vehicles for multiple leased assets, which finance and transfer to a particular lessee ownership of leased assets, to the same regulatory treatment as asset-leasing vehicles for single leased assets, which finance and transfer to a particular lessee ownership of just a single leased asset. This is because, besides a management board, neither type of asset-leasing vehicle normally has any staff of its own. An asset-leasing vehicle for multiple leased assets holds only a small number of large-volume leased assets in order to shield against risk, but – as with asset-leasing vehicles for single leased assets – it is managed by one managing leasing company. Another key prerequisite for exemption from the authorisation requirement is that no business policy decisions are made by the asset-leasing vehicle. It must also be managed by an institution that is already under supervision, is established within the European Economic Area and is authorised to engage in financial leasing in its state of origin. Furthermore, all factoring and financial leasing institutions are now exempt from the requirement to identify risk takers. The exemption of factoring and financial leasing institutions from the obligation to appoint committees will remain unchanged. The introduction of a definition of the term “significant institution” had necessitated a revision in this regard. However, the general order

requiring that, depending on the size, internal organisation and the nature, scope, complexity and riskiness of the activities of the institution, the administrative or supervisory bodies of factoring and financial leasing institutions shall appoint from among their members committees to advise and support them in their tasks, will remain in effect. In addition, the Federal Financial Supervisory Authority (BaFin) has the power to require the appointment of committees. On the grounds of equal treatment and due to the fact that there appears to be no increase in risk associated with the shift from asset-leasing vehicles for single leased assets to asset-leasing vehicles for multiple leased assets, this solution appears appropriate.

Overview of the new MREL framework

	G-SIIs	Top-tier banks (>€100 billion total assets and "fishing" option)	Other banks (for which resolution is envisaged ¹)
As of applicability of the banking package ²	16% of RWAs 6% of LRE Higher institution-specific requirement as appropriate ³	Institution-specific requirement ³	Institution-specific requirement ³
From 1 January 2022	18% of RWAs 6.75% of LRE Higher institution-specific requirement as appropriate ³	13.5% of RWAs 5% of LRE Higher institution-specific requirement as appropriate ³	Institution-specific requirement ³
From 1 January 2024	18% of RWAs 6.75% of LRE 8% of TLOF Higher institution-specific requirement as appropriate ³	13.5% of RWAs 5% of LRE 8% of TLOF (but not more than 27% of RWAs) Higher institution-specific requirement as appropriate ³	Institution-specific requirement ³ 8% of TLOF at discretion of resolution authority
Subordination requirement ⁴	In principle, yes ⁵		Case-by-case decision ⁶

1 For banks for which insolvency proceedings are envisaged, the resolution authority can set MREL equal to the loss absorption amount (= minimum capital requirements). **2** BRRD II to be transposed by 28 December 2020, SRMR II applicable from 28 December 2020, CRR II applicable in principle from 27 June 2019. **3** Starting prudential formula for calculating the institution-specific requirement: $2 \times \text{Pillar1} + 2 \times \text{Pillar2} + \text{market confidence amount} \text{ or } 2 \times \text{leverage ratio}$. **4** The subordination requirement is capped by law (8% of TLOF or "prudential formula", see footnote 3); see Article 45b(7) of BRRD II. **5** Exceptions are possible pursuant to Article 72b(3) to (5) of CRR II. **6** At the discretion of the resolution authority under Art. 45b(5) of BRRD II (especially: yes if there is a risk that creditors whose claims arise from non-subordinated liabilities incur greater losses than they would otherwise have incurred in the winding-up under normal insolvency proceedings in accordance with the "no creditor worse off" (NCWO) principle).

Deutsche Bundesbank

both the amount of the MREL requirement and the decision on whether this must be met with subordinated instruments are at the resolution authority's discretion.

Protecting retail clients

Protecting retail clients by introducing a minimum denomination amount

In principle, retail clients should not hold any instruments that are part of the banks' primary loss-absorbing capacity, except for equities. The new Article 44a of BRRD II has therefore introduced two options to protect retail clients from non-risk-appropriate investments in MREL-eligible liabilities. These are either a minimum initial investment amount of €10,000, though retail clients – where their financial instrument portfolio does not exceed €500,000 – are permitted to invest up to a maximum of 10% of their financial instrument portfolio in such liabilities, or alternatively a minimum denomination amount of €50,000.

Germany has decided to implement the second option, introducing a minimum denomination amount of €50,000 for the subordinated MREL-eligible liabilities of all banks. Furthermore, Article 44a of BRRD II also allows for the introduction of a minimum denomination amount for Additional Tier 1 and Tier 2 capital. In Germany, these instruments are therefore also subject to a minimum denomination amount of €50,000. For small and non-complex institutions, a different minimum denomination amount of €25,000 applies to the latter capital instruments. Legislators did not, then, avail themselves of the possibility of setting a minimum denomination amount higher than €50,000.

Minimum denomination amount of €50,000 or €25,000

The introduction of a minimum denomination amount is intended to ensure that retail clients do not invest their assets excessively in instruments that can be primarily used for a bail-in. Such retail clients should not be in the first line of defence to absorb losses in the event of an

institution's resolution or insolvency. Instead, investment in such instruments should be reserved for institutional investors, who ought to be better able to bear losses and assess the risk-return relationship of such instruments. A retail client is not generally able to assess whether the return on an instrument that constitutes Additional Tier 1 capital, Tier 2 capital or other subordinated capital adequately reflects the risk of default, especially as such instruments, in contrast to equities, tend to be perceived as low-risk fixed income investments.

Particularities with regard to the opening of liquidation proceedings

Changes to German law not required for implementation of Article 32b of BRRD II

The new Article 32b of BRRD II has introduced an additional set of circumstances for opening liquidation proceedings. This is intended to address situations in which an institution has been classified as "failing or likely to fail" (FOLTF) but where a resolution action would not be in the public interest and there are as yet no grounds at the national level for opening liquidation proceedings. However, should such circumstances arise, it is not intended that they end up leaving the institution concerned in limbo because it can neither be wound up nor liquidated under national insolvency proceedings. As legislators were of the view that Section 46 of the Banking Act (moratorium powers) and the grounds for opening insolvency proceedings laid down in Sections 17 to 19 of the Insolvency Code (*Insolvenzordnung* – InsO) already provided supervisors with instruments for handling such institutions, it was not deemed necessary to amend the existing legislation in Germany to avoid such limbo circumstances.

Credit Institution Reorganisation Act repealed

The Credit Institution Reorganisation Act (*Kreditinstitute-Reorganisationsgesetz* – KredReorgG)

is being repealed under the amendments introduced by the Risk Reduction Act. This is being done on the grounds that it has not attained any practical relevance and has become obsolete since the introduction of the European resolution regime.

Amendments to other legal acts

The Risk Reduction Act also amends the Deposit Guarantee Act (*Einlagensicherungsgesetz* – EinSiG). The amendments concern both matters relating to the organisation of compensation schemes and the clarification of issues relating to depositor compensation, for example with regard to non-eligible deposits or the scope and calculation of compensation claims as in the case of trust accounts, for instance.

Changes to Deposit Guarantee Act concern organisation of compensation schemes

Of greater significance, however, is that the German promotional banks, having been removed from the scope of EU banking regulation, likewise no longer fall within the ambit of the Deposit Guarantee Act, as only CRR credit institutions are subject to the statutory obligation to provide depositor compensation. This will affect the existing membership of these institutions in the compensation scheme of the Association of German Public Banks (*Entschädigungseinrichtung des Bundesverbandes Öffentlicher Banken Deutschlands GmbH*). Against this backdrop, the Deposit Guarantee Act now provides for the possibility of revoking membership and for the risk-appropriate transfer of contribution-funded financial resources to a different compensation scheme. The amendment to the Deposit Guarantee Act is also being used to close a gap in the Act. Thus far, the Deposit Guarantee Act has not given protection schemes the ability to levy special contributions to fulfil liability claims pursuant to Section 145 of the Act on the Recovery and Resolution of Institutions and Financial Groups. It is now set to be amended accordingly.

■ Outlook

*Post-crisis
agenda still not
wrapped up*

The banking package and completion of its intended regulatory effect through national implementation represent another major step towards wrapping up the regulatory post-financial-crisis agenda and a significant contribution to a further reduction of risk in the banking sector. However, there is still more to be done. The European Commission is already working on drafts of CRR III and CRD VI, which are intended, in particular, to implement the final Basel III package concluded at the end of 2017.

*Postponement
of Basel reforms
due to COVID-19*

In March 2020, the Group of Central Bank Governors and Heads of Supervision (GHOS) agreed to postpone the implementation of the final Basel III reforms by one year in response to the impact of the COVID-19 pandemic.³¹ Under the Basel standards, this is now scheduled for completion by 1 January 2023, as is the implementation of the amended Pillar 3 requirements. In

light of this, subsequent deadlines are also being pushed back. The phase-in of the output floor will now end on 1 January 2028, and both the Fundamental Review of the Trading Book (FRTB) and the amended Credit Valuation Adjustment (CVA) framework will not have to be implemented until 1 January 2023. In August 2020, the EBA received a second call for advice from the European Commission inviting it to update its analysis under the first call for advice in light of the impact of the COVID-19 pandemic. In response, the EBA published its recommendations on the implementation of Basel III in the EU, which include a quantitative impact assessment based on participating banks' data and a number of policy recommendations. The results provide a basis for the legislative proposal to transpose Basel III into European law (CRR III) that the European Commission is expected to present by mid-2021.

German enterprises' profitability and financing in 2019

Just prior to the outbreak of the coronavirus pandemic, the profitability of non-financial enterprises was still in good shape despite the marked slowdown in the German economy in 2019. Sales were expanding significantly, although the rise was not quite as steep as in the previous two years due to subdued global export demand and probably also to price effects. This meant that the export-oriented manufacturing sector struggled to lift sales, while domestically oriented sectors were again able to record an above-average increase. On the cost side, enterprises were confronted with higher personnel costs and additional interest-related pension provisions, while falling prices for intermediate goods and industrial raw materials afforded some relief. Overall, German enterprises' average pre-tax profit margin remained virtually unchanged at 4.3% in 2019.

Enterprises' scope for internal financing broadened further in the reporting period driven, amongst other things, by higher profit retention. They drew much less on additional borrowed funds in 2019 than in the previous year and trade payables, in particular, declined. The increase in liabilities to banks continued, however.

The financial statements available to date provide an insight into the business sector's liquidity and stability prior to the crisis. Overall, non-financial enterprises were very well positioned in terms of their financing conditions and capital structure in 2019. Both the liquidity and stability ratios of the business sector as a whole were relatively high and exceeded the levels recorded in the years immediately preceding earlier recessions or crises. Despite larger sectoral differences and with the exception of a few weaker positions in some economic sectors, this finding is generally true across all sectors.

Revenue shortfalls – which are considerable in some cases – stemming from the coronavirus pandemic and the measures taken to contain it will weigh on enterprises' profit margins in 2020. In addition, both the depth and speed of the economic slump triggered by the pandemic presented enterprises with unprecedented challenges in safeguarding liquidity. Thanks to the German business sector's sound financial footing at the beginning of the crisis and to government financial assistance measures provided this year – and partly also to the temporary suspension of the obligation to file for insolvency – the business sector is yet to witness a surge in cases of insolvency in 2020.

Marked economic slowdown and robust domestic economy on the demand side ...

Underlying trends

In 2019, the German economy was characterised by a marked slowdown in economic activity. At 0.6%, growth in real gross domestic product (GDP) was only modest. Economic growth in the reporting year was well below the growth rate of potential output, thus lowering the German economy's capacity utilisation and returning aggregate capacity utilisation more or less to an average level following the high figure recorded in the preceding year. Adverse global conditions were the main factor weakening economic activity in Germany in 2019. The slowdown in the global economy

dampened demand for capital and intermediate goods, which are important components of Germany's exports. Overall, German exports saw only marginal growth. Despite the slowdown in economic activity, domestic private consumption rose perceptibly and at an unchanged pace. Housing investment and the expansionary fiscal policy also provided impetus. Given shrinking order books and rather gloomy business expectations, however, investment in machinery and equipment failed to notably boost demand.

Enterprises' pre-tax profit margin remained virtually unchanged at 4.3% in 2019.¹ On the one hand, the higher labour costs, which were due to robust wage growth and the return to full joint financing of the statutory health insurance scheme, dampened corporate profit margins. On the other hand, the prices of intermediate goods and industrial raw materials fell, and the need to adjust pension provisions was somewhat smaller, probably thanks to an increase in the value of the assets held for settlement. The income side also benefited from a significant increase in investment income. The two-speed development of the economy in the reporting year is also reflected in the heterogeneous profitability of enterprises when broken down by economic sector. While the gross profit margin of the export-oriented manufacturing sector took a harder hit, sectors with a greater domestic focus were even able to increase their profitability, with some – namely construction as well as accommodation and food service activities – achieving all-time highs.

... as well as burdens and relief on the cost side meant no change in gross profit margin on balance in 2019

* Extrapolated results from corporate financial statement statistics. **1** (Cash + short-term securities) / short-term liabilities. **2** (Cash + short-term securities + short-term receivables) / short-term liabilities. **3** (Cash + short-term securities + short-term receivables + inventories) / short-term liabilities. **4** Equity / total assets. **5** Long-term liabilities / equity. **6** EBIT / interest expenses. **7** EBITDA / interest expenses.

The number of corporate insolvencies fell for the tenth time in a row in 2019 in view of enterprises' sound capital base as well as favourable financing and debt restructuring conditions, and stood at its lowest level since the

Corporate insolvencies at lowest level since introduction of Insolvency Act in 1999

¹ The analysis for 2019 is based on some 22,000 financial statements, which were roughly extrapolated based on the evaluation of aggregate sales data from the company register. For a description of the procedure, see Deutsche Bundesbank (2011).

introduction of the Insolvency Act in 1999.² However, the scale of the decline was less pronounced in 2019 than in previous years. In some economic sectors, such as manufacturing and energy supply as well as transportation and storage services, the frequency of insolvencies rose slightly.

■ Liquidity and stability ratios

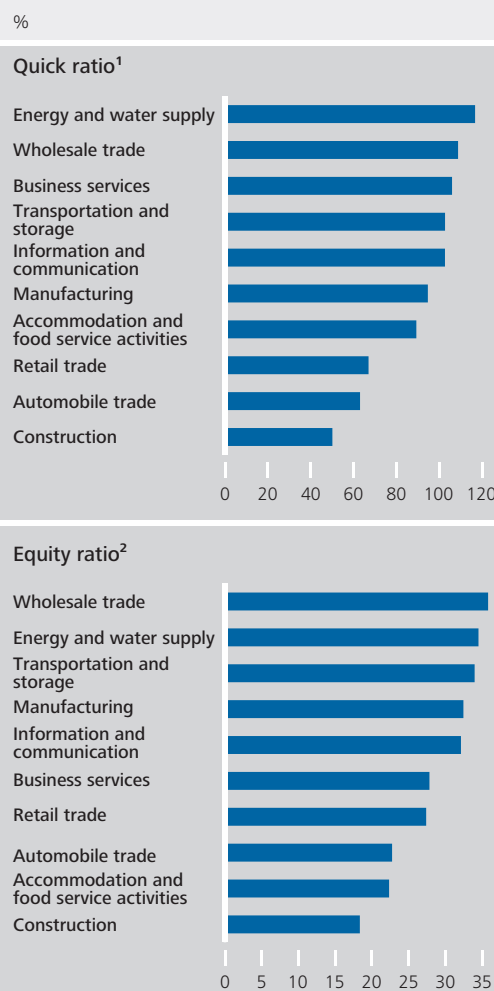

Sound financing conditions and capital structure in business sector prior to coronavirus pandemic ...

The coronavirus pandemic and the measures required to contain its spread drove up enterprises' need for short and medium-term financing in 2020 as they struggled to cope with considerable revenue shortfalls. The most recent financial statements available for 2019 can be used to assess the liquidity and stability of both the business sector as a whole and of individual sectors at the beginning of the crisis. Years that immediately precede earlier recessions or crises constitute a suitable benchmark. Compared with the years prior to the economic downturns in 2002-03 and 2009, non-financial enterprises were, on the whole, more robust in terms of their financing conditions and capital structure. Liquidity levels in the business sector as a whole were much higher. Depending on the indicator, sufficient or ample short-term funds were available to cover total short-term liabilities in 2019. A similar picture emerges with regard to the business sector's stability ratios. Long-term debt ratios were lower and the equity base was stronger. The aggregate interest coverage ratio also improved over time on its already high level, presumably boosted not only by the lower debt ratio and enterprises' higher profitability, but also by the ongoing low interest rate environment.³

... across economic sectors, despite larger sectoral differences

Liquidity levels do, however, vary at sectoral level. In around half of the economic sectors under review, the quick ratio came in at under 100%, for each sector as a whole. This measure is frequently used in practice and is based on the ratio of assets that can be liquidated at short notice, excluding inventories, to short-

 Deutsche Bundesbank

2 The last considerable rise in overall corporate insolvencies was recorded during the financial and economic crisis of 2008-09. However, in view of the magnitude of the economic downturn, even this increase of around one-tenth was moderate.

3 By contrast, the lowering of the discount rate for pension obligations means that enterprises with corresponding commitments must adjust their pension provisions in line with interest rates, something that is generally recorded under interest expenses in enterprises' income statements. This, by definition, pushes down the interest coverage ratio and limits comparability with years prior to 2010 in which no annual adjustment to the applied rate of interest was necessary.

Updated assessment of the development of zombie firms in Germany

The process of market entry and exit of firms, a key feature in market economies, may have lost effectiveness as a result of the low interest rate environment in the euro area, which has now persisted for several years. For instance, it may be in the interest of undercapitalised lenders to continue financing inefficient or even insolvent corporate debtors (known as zombie firms).¹ First, this is because low interest rates tend to reduce the opportunity costs for creditors that arise from rolling over loans to financially weak firms or allowing deferral of payments. Consequently, write-downs on claims, realisation of losses and formation of provisions could then be avoided for a time. However, as a result, economic resources would continue to be put to less productive uses and the intensity of competition might decline.²

An updated assessment of the importance of zombie firms in Germany in the low interest rate environment is carried out on the basis of individual data from non-financial firms in the Bundesbank's financial statement statistics.³ The extension of the reference period to 2018 takes into account the possibility that the persistent low interest rate environment in the euro area may, with a time lag, bring about a rise in the number of zombie firms.⁴ In addition, the calculations serve to provide the most up-to-date assessment of the share of zombie firms prior to the outbreak of the coronavirus pandemic.

Statistical classification of zombie firms

In line with the academic literature, a first variant classifies as a zombie firm any enterprise that cannot cover its interest payments

with its operating income for three consecutive years. The interest coverage ratio for a zombie firm – in other words, the ratio of operating income to interest expenditure – would be less than one. In a second variant, a zombie firm is defined as an enterprise that has negative cash flows for three consecutive years.

With regard to the first variant, two statistical aspects must be taken into account. First, when determining interest coverage ratios, interlinkages between enterprises on the income side are also incorporated by adding income from equity holdings in other firms to the operating result from core business.⁵ Second, it is likely that an enterprise's total interest expenditure, including spending on discounting-related additional pension provisions, is decisive for its economic survival. For this reason, inter-

¹ See, for example, Acharya et al. (2020) or Schivardi et al. (2017).

² Empirical research suggests a relationship between the slowdown in productivity growth in some advanced economies over the past few decades and a rise in the number of zombie firms. See Adalet McGowan et al. (2018).

³ For analyses for the 2015 reporting year, see Deutsche Bundesbank (2017). For a description of the JANIS dataset used, see Becker et al. (2020).

⁴ In order to isolate the causal effect of monetary policy on the emergence of zombie firms via the interest rate channel, it would be necessary to use a counterfactual scenario that models the incentives and behaviour of banks and the entry and exit of (zombie) firms. As the dataset used contains no information on market entries or exits, amongst other things, it is not possible to set up such a counterfactual scenario.

⁵ In the dataset, the reported interest expenditure may also include interest on loans that a parent company has taken out for its subsidiaries or affiliates. Such affiliations statistically lower the parent company's interest coverage ratio, increasing the likelihood of it being incorrectly classified as a zombie firm, all else being equal. Such distortion can be counteracted by taking account of the investment income metric when determining the interest coverage ratio.

est expenditure also includes spending on such additional pension provisions.⁶

No increase in importance of zombie firms in low interest rate environment

When assessing the extent to which the low interest rate environment has fostered the emergence of zombie firms in Germany, developments since 2007 – prior to the start of the Great Recession – have been of particular interest. According to the figures, the share of zombie firms has decreased in the low interest rate environment. Based on the first variant considered, it stood at just 6¼% in 2018, the most recent year for which sufficient data for this analysis are available.⁷ It was thus considerably smaller than in the years preceding the exceptionally sharp decline in interest rates.⁸ This confirms the findings of earlier analyses, according to which zombie firms accounted for only a small share of enterprises in Germany, and their quantitative importance has not increased in the low interest rate environment.⁹

The data show that the revenue share of zombie firms in 2018 was only marginally higher than in 2007. In the same period, the share of tangible fixed assets held by zombie firms declined markedly on balance. Furthermore, measured in terms of the gross increase in tangible fixed assets in relation to total assets, zombie firms invested less than other enterprises. The ratio of annual results before taxes on income to gross revenue was negative for zombie firms. Moreover, these firms had lower equity ratios, which declined during the low interest rate period, meaning that their liabilities (in relation to total assets) were higher than those of the other enterprises. The figures indicate that zombie firms did not play a quantitatively significant role in Germany in terms of their number and shares of rev-

Deutsche Bundesbank

enue and tangible fixed assets. It therefore cannot be established that they had a perceptible dampening effect on aggregate productivity developments or on economic growth in general.

Zombie lending probably of minor importance in Germany

Another channel through which zombie firms may contribute to the misallocation of economic resources is via banks' lending to such enterprises (known as "zombie lend-

⁶ Under German law, persistently low interest rates necessitate additional pension provisions for enterprises that have committed to paying occupational pensions to current and former employees. These provisions are recorded in the dataset as interest expenditure or labour costs. See also Deutsche Bundesbank (2016).

⁷ Robust results for 2019 are not yet available due to the currently very limited data availability of the relevant individual accounts.

⁸ It should be noted that, taken in isolation, the decline in the interest rate level in recent years is likely to have helped stabilise enterprises' interest coverage ratios.

⁹ The alternative variant based on cash flow produces a similar picture, with the share of zombie firms generally being lower than in the other variants and only increasing slightly in the period from 2007 to 2011.

ing").¹⁰ The development of zombie firms' liabilities to credit institutions (measured in terms of total assets) is remarkable: prior to the marked decline in interest rates, zombie and non-zombie firms were more or less equally indebted to credit institutions. In 2018, by contrast, the liabilities of non-zombie firms to credit institutions were just over six times as high. As zombie firms now have relatively low outstanding debt to credit institutions compared with other enterprises, the extent of resource misallocation via this channel is likely to be limited.

Impact of the coronavirus pandemic on the share of zombie firms

In view of the exceptional reduction in economic activity in 2020, the number of busi-

ness insolvencies is likely to increase significantly in the coming quarters.¹¹ The profitability of non-financial enterprises in Germany will probably deteriorate in the current year as a result of the pandemic, and corporate liabilities will tend to increase. Taken in isolation, both factors exert downward pressure on interest coverage ratios and thus increase the probability of enterprises attaining zombie status in statistical terms. In order to avoid unprofitable business models remaining in the market and resources being used inefficiently in the economy as a whole, obstacles hindering the market exit of zombie firms should be circumvented or eliminated. This also means that the current government assistance measures – such as making it easier to take up short-time work, guarantees for corporate loans and tax relief – should only be maintained for as long as necessary and should be phased out as the economy recovers.

¹⁰ The term gained prominence in connection with developments in Japan. In the 1990s, lending to unprofitable enterprises continued, partly owing to the regulatory framework in the banking sector. For analyses of zombie lending in the euro area, see, for example, Storz et al. (2017).

¹¹ See Deutsche Bundesbank (2020).

term liabilities.⁴ As expected, liquidity ratios were relatively low, particularly in sectors that have a high level of inventories due to the nature of their business activity, such as the construction, automobile trade and retail trade industries. Accommodation and food service activities, which have been hard hit by measures to contain the pandemic, and the manufacturing sector also recorded relatively low maturity matches.⁵ Construction, accommodation and food service activities, and automobile trade had low levels of equity compared with the other economic sectors. Differences in the interest coverage ratio were more pronounced across sectors. The figures were relatively low in the manufacturing, transportation and storage, energy, and information and communication sectors. However, in almost all economic sectors, the interest coverage ratio was many times higher than the level at which current interest payments from operating activities can be serviced.⁶ Despite larger sectoral differences and, in some cases, lower indicator values in individual economic sectors, financing conditions and the capital structure in the business sector can be deemed sound across sectors.

■ Sales and income

Sales growth also reined in by price effects

Sales growth among non-financial enterprises in 2019 was lower than the sharp increase over the previous two years, albeit still quite substantial at just under 3%. Volume growth is likely to

⁴ This is merely a statistical benchmark. In addition, sectoral particularities and group interconnections must be taken into account. A low liquidity ratio does not necessarily indicate a threat to solvency as liquidity can be passed on between affiliated enterprises within a group, for instance. The quick ratio should reflect the solvency of enterprises better than the current ratio as it is more difficult to liquidate inventories, which are included in the latter, than other short-term assets.

⁵ If inventories are factored into short-term assets (current ratio), the construction, automobile trade, retail trade and manufacturing sectors do not have noticeably low liquidity ratios. In accommodation and food service activities, by contrast, the ratio of cash and short-term securities to short-term liabilities (cash ratio) was high compared with the other sectors.

⁶ The interest coverage ratio should be well above 100% as other liabilities need to be serviced alongside interest payments.

have been a greater factor in the increase in sales revenues than price effects, as sales prices for goods and services rose less than half as much as sales. For example, the prices of industrial goods on the domestic market went up by 1.1%, and prices for goods exports were also only 0.5% higher than in 2018. Interest income saw a resurgence after the previous year's low figure. Income from long-term equity investments rose significantly thanks to high dividends of participating enterprises in trade as well as information and communication services.

The continued weakness in industry was also reflected in the very muted overall growth in

manufacturing revenue in 2019. In most areas of manufacturing, revenue even declined. Vehicle manufacturers were an exception, recording stronger sales growth again after revenue had expanded only moderately in the previous year owing to supply-side difficulties following the introduction of the new emissions test procedure. In domestically oriented sectors, the positive growth in sales continued in 2019. Construction revenue rose particularly sharply in light of the ongoing boom in the sector's activity.

At 3%, non-financial enterprises' total expenses grew just as steeply as total income in the re-

Significant increase in personnel expenses, depreciation and other expenses, while cost of materials lower

porting year. This was due to sharply higher depreciation and raised personnel expenses. In addition to the increase in pensions provisions and the return to parity financing of the statutory health insurance scheme, the marked wage rises in the reporting year are likely to have been a factor in the rise in personnel expenses. Interest expenses, which in the low interest rate environment are largely influenced by changes in the applied rate of interest in pension provisions, went back down after having risen very sharply in 2018. The growth in the cost of materials was only half as strong as in the previous two years, not least because commodity prices fell in 2019.

■ Sources and uses of funds

In 2019, enterprises' sources and uses of funds declined significantly in light of the economic slowdown. The fall in the sources of funds was spurred by a sharp decline in external funds whilst internal funds rose perceptibly. The reduced build-up of short-term liabilities compared with 2018 was the main factor behind the developments in external financing. On the expenditure side, the acquisition of financial assets in particular grew less sharply than in the previous year. The acquisition of tangible fixed assets in the reporting year likewise fell short of the figure in 2018. Although new investment

beyond replacement purchases and the gross increase in tangible fixed assets did record a new peak overall, this was more than offset by a much weaker trend in the formation of inventories.

Balance sheet developments

The total assets of non-financial enterprises expanded in 2019. However, consistent with the somewhat slower growth in sales, this increase of around 4% was smaller than in the previous two years. On the assets side, the share of financial assets in total assets remained broadly

unchanged as in 2018. As enterprises become increasingly interlinked, long-term equity investments and receivables from affiliated companies rose sharply again. The electrical engineering industry recorded the highest acquisition of long-term equity investments, although the chemical and pharmaceutical industry as well as the information and communication sector significantly expanded their long-term equity investments as well. Trade receivables declined slightly on the year, while the cash item did not increase for the first time since 2010. In addition to one-off effects in the automobile and energy sectors, this may also have been attributable to custody fees on enterprises' bank bal-

Growth in total assets and financial assets slightly weaker than in previous years

ances. Securities holdings increased only marginally due, in particular, to developments experienced by individual wholesale enterprises.

Strong rise in non-financial assets, albeit at a slower pace

The expansion in non-financial assets – both overall and by sector – was steep in 2019, albeit somewhat weaker than in the previous year. The share of tangible fixed assets in total assets remained broadly unchanged. A number of sectors – including chemical and pharmaceutical, the automobile industry, construction, motor vehicle trade, the information and communication sector, and business services – accumulated tangible fixed assets at an above average rate. Furthermore, non-financial enterprises continued to invest in intangible fixed assets. Wholesale trade, in particular, significantly increased its holdings in the concessions, property rights and licenses included under this item. Vehicle manufacturing, energy companies and the sector of transportation and storage also saw growth in this area. Although inventories again outpaced total assets, this increase was significantly lower than in the previous two years. Most of the inventories were once again formed by the construction and manufacturing sectors, while trade also expanded its stocks substantially.

Equity ratio remains high

The equity ratio of non-financial enterprises grew broadly across sectors in 2019, following a slight decline in aggregate terms in the previous year. This means that it remained at a more or less unchanged high level on average in 2018-19. Both small and medium-sized enterprises and large enterprises experienced this increase in the reporting year, with the gap between the size classes narrowing further.

External funds also saw weaker growth than in previous years

Although there was marked growth in external funds, this remained below the increase in own funds. This was primarily due to the moderate rise in liabilities to affiliated companies, which had been stepped up considerably in previous years. In addition, trade payables fell for the first time since 2015, which might also be due to the faster settlement of existing trade payables owing to custody fees for holding bank

Deutsche Bundesbank

balances. By contrast, liabilities to banks – especially those with a short maturity – rose significantly, recording the highest growth rate in a decade. Once again, the construction sector received higher advance payments than before; this is in line with the sector's high inventories, which also include construction projects that have been started but are not yet finished. Since long-term bond holdings rose significantly in 2019, overall borrowing through the issuance of bonds grew more strongly than before despite the decline in short-term bonds. Provisions also went up sharply on account of the additional provisions for pensions required by the continuing fall in the discount rate.

Trends for 2020

The coronavirus pandemic and the measures taken to contain it are likely to have a profound impact on the financial statements of non-financial enterprises in 2020. The official order to close businesses and other measures have already led to a widespread loss of revenue in the affected sectors, such as food services, travel services, other recreation and cultural services, textile retail and passenger transport, in individual months. The impact of the pandemic has also weighed considerably on German industry's foreign business over the course of 2020 thus far. Global demand for German export products declined sharply, and global supply chains experienced disruption in some cases. In addition, investment in machinery and equipment is likely to decrease sharply this year due to cyclical factors. By contrast, robust housing investment is expected to boost growth. Furthermore, the comprehensive package of fiscal assistance measures is having a stabilising effect. Enterprises' profit margins in 2020 are likely to be significantly affected by the negative economic shock caused by the pandemic as the variable cost component labour will not decline to the same extent as sales despite the partial termination of employment contracts and the massive recourse to short-time work. In addition, the continued need for adjustment to provisions for pensions due to the discount rate is likely to result in higher expenditure on the cost side.⁷ By contrast, the deep global recession in 2020 means that there are signs of relief in the form of significant price declines in intermediate goods and industrial raw materials.

Coronavirus pandemic likely to have significant impact on enterprises' profit margin

Both the depth and speed of the economic slump triggered by the coronavirus shock have posed unprecedented challenges to enterprises

⁷ The discount rate for pension obligations is expected to fall further by around 0.4 percentage point on the year in 2020.

Profitability and financial position of German listed groups in 2019 and an outlook for 2020

In the difficult setting of the global slow-down in growth, German listed non-financial groups were able to generate higher revenues in 2019. At the same time, significant cost increases had an impact, making for a significantly lower profit margin¹ than in previous years. Adjusted for changes in the scope of consolidation, it fell by 1.5 percentage points to 6.0% last year, falling short of the 6.7% average for the period since reporting commenced in 2005.² This was mainly due to the negative yield development in the manufacturing sector, whereas the services sector profit margin was only slightly down and remained at a comparatively high level.

The reporting group posted a slight 2.6% rise in revenue. According to the annual reports, this development was attributable, in the main, to positive currency effects in connection with the consolidation of foreign subsidiaries.³ In addition, higher sales served, in some instances, to offset unfavourable developments in producer prices. Overall, around 70% of the groups increased their revenue in 2019, with service providers seeing significantly more pronounced growth than groups belonging to the manufacturing sector.

Earnings before interest, taxes, depreciation and amortisation (EBITDA) remained virtually constant with an increase of 0.4%. The application of modified accounting standards had a positive effect on operating income and, as a result, the weakening of profitability might be understated by the

Revenue, earnings and profit margin of German non-financial groups

1 Defined here as the ratio of operating income (earnings before interest and taxes (EBIT)) to revenue.

2 The rates of change for profit margin, revenue, EBITDA and EBIT are published with reporting and consolidation basis adjustments. The figures in the charts are unadjusted so that the size differentials between the items are visible. For methodological reasons, there may therefore be differences between the rates of change and the path shown in the charts.

3 The nominal effective exchange rate of the euro against the currencies of the 42 most important trading partners of the euro area fell by an average of 1.5% on an annual basis in 2019, which has a positive impact on the euro countervalues when converting revenue from foreign currency to euro.

Equity of German non-financial groups

As a percentage of total assets

1 Decision to phase out nuclear energy following the Fukushima catastrophe.

Deutsche Bundesbank

figures.⁴ The higher volume of depreciation caused by the changes – while leasing expenses were eliminated – pushed EBITDA, taken in isolation, upwards.

Operating income (EBIT) fell by 17.9% compared with the previous year. If the effects stemming from the revised accounting rules are taken into account, the performance of profitability is likely to have been even more unfavourable. The decline is attributable exclusively to enterprise groups belonging to the manufacturing sector, which account for around 70% of the reporting group's total income. By contrast, service providers were able to increase their operating income slightly. For both sectors, the main factors driving income down were higher raw material costs as well as impairments and special expenses. This included goodwill impairment and write-downs of production facilities due to poor earnings prospects and difficult sales conditions in the chemical and automotive sectors, retrofitting costs rooted in the emissions scandal, provisions for legal disputes and penalties arising from corruption proceedings, and impairment linked to the energy sector's move away from coal.

The balance sheet saw considerable increases in tangible fixed assets and financial assets, up by 21% and 16% respectively. This was mainly owing to newly capitalised right-of-use assets in connection with changes in international accounting standards and a significant exchange transaction in the energy sector.⁵ Investment by car manufacturers (particularly in the field of e-mobility) was another factor in the second half of 2019. In addition, intangible assets increased as a result of acquisitions and technological developments (licence purchases in the telecommunications sector).

In terms of financing, debt rose significantly more strongly than equity, meaning that the aggregate equity ratio contracted by 1.2 percentage points to 29.3%. Both large and small groups were affected here. Around three-quarters of the groups posted a lower equity ratio than the year before. As a result, the leverage ratio rose slightly from 2.3 to 2.4.

A dramatic 21% increase in long-term financial debt set the tone for the debt position. Newly recognised lease liabilities amounting to an estimated €90 billion were a factor here, as were financial liabilities

⁴ As a result of the change in how operating leases are treated for accounting purposes (International Financial Reporting Standard 16), tangible fixed assets and the associated depreciation and financial liabilities rose significantly. This accounting effect amounts to around €84 billion for tangible fixed assets and around €90 billion for financial liabilities (equivalent to around 11% and 9% of the figure for each item, respectively). Depreciation and amortisation rose by approximately €9 billion.

⁵ The exchange transaction was recognised on the balance sheet in the third quarter of 2019. In the previous year, the parts of the group earmarked for sale were reported as discontinued operations in the group reports and were therefore treated as disposals in the consolidated financial statement statistics. In the third quarter of 2019, these group units were consolidated for the first time in the respective receiving groups and were thus recorded as additions in the consolidated financial statement statistics.

ities arising from the exchange transaction in the energy sector (€20 billion). In addition, annual reports reveal that bonds were issued to finance sales and that liabilities for future corporate acquisitions were built up. At the same time, aggregate pension obligations grew by around one-fifth, or €28 billion, as a result of the decline in the reference interest rate applied for accounting purposes.⁶

The coronavirus pandemic has been a decisive force shaping business performance over the course of 2020 so far. Unlike the individual financial statements, the consolidated financial statements capture the globally integrated value-added chains within the groups. Consequently, the financial information provided by the groups serves as a particularly revealing reflection of global economic developments and the domestic conditions prevailing in the countries where each subsidiary is located. Production stoppages and branch closures in partner countries were felt throughout intra-group value chains, weighing on all upstream and downstream links. By contrast, the individual financial statements show, in particular, the part of the value chain that unfolds in Germany. Owing to the global composition of the groups, the first effects of the coronavirus pandemic were already being felt in January and February of this year. In the first quarter of 2020, pre-tax profit had already fallen by more than half compared with the same period of the previous year. Estimates based on the financial statements of the largest groups in the reporting population covering the first three quarters of the current year suggest that the aggregate pre-tax profit margin (earnings before tax as a percentage of revenue) will plunge in 2020 and could turn negative for the first time since these statistics were first compiled in 2005. This is due, in particular, to a sharp downturn in

Annual result before taxes on income

As a percentage of revenue

1 Seasonally adjusted average for Q1 to Q3 2020.
 Deutsche Bundesbank

the spring months, while the estimates show that a clear recovery had already begun in the third quarter. The groups in the manufacturing sector were key to the extremely weak figures. In terms of the services sector, the aviation industry experienced declines but these were partly offset by positive developments in the telecommunications, logistics and software sectors.

According to the group reports, cross-sector declines in demand, closures of trading outlets and production stoppages worldwide plus currency effects are likely to have placed significant strains on revenue. It is estimated to have fallen by almost one-tenth in the first three quarters of 2020 against the same period last year. Profit before tax is likely to have dropped by more than 90% over this period. In addition to the repercussions of the pandemic, such as increased depreciation of tangible and intangible assets, a key factor in this drop was an additional extraordinary burden arising from multi-billion-dollar criminal proceedings in the chemicals sector⁷ and the associated additional provisioning.

⁶ Extrapolated based on the 34 largest groups.

⁷ This one-off effect amounts to around €20 billion.

There may have been barely any year-on-year change in the tangible fixed asset ratio. Goodwill impairments are likely to have been offset by the countermovement of intangible assets build-up in the wake of new corporate acquisitions. There was a slight decline in tangible fixed assets net of goodwill.

As cash inflows from operating activities dropped off, groups secured their liquidity by scaling up bond issuance, taking on more bank liabilities and selling off business units. Across all sectors, there was a marked increase in liquid funds. On the financing side, this was accompanied by a corresponding increase in debt. A major corporate takeover was also a contributing factor here. In turn, the equity ratios of groups in all sectors will likely have fallen this year, though the strongest decline will have been recorded by enterprise groups belonging to

the services sector. Poor profitability depressed equity in the manufacturing sector. The exceptional path traced by the services sector is entirely on the back of a major takeover in the telecommunications industry.

Safeguarding liquidity a major challenge despite relatively sound financial footing of business sector and crisis-related government assistance measures

when it comes to safeguarding liquidity.⁸ Fiscal policymakers initiated, amongst other things, extensive lending programmes by promotional banks with a full assumption of credit risk by government in some cases. Besides access to existing credit lines, this is likely to give rise to a considerable increase in corporate liabilities to banks.⁹ Nevertheless, given the German business sector's sound financial position at the beginning of the crisis and the government's financial assistance measures – as well as the temporary suspension of the obligation to file for insolvency, which is tied to certain conditions – there does not appear to be a substantial rise in corporate insolvencies in 2020.¹⁰

⁸ See also the results of the first wave of the Bundesbank's pilot survey on the expectations of firms in Germany (<https://www.bundesbank.de/en/bundesbank/research/pilot-survey-on-the-expectations-of-firms>).

⁹ Moreover, in addition to the increase in the bonds item, there may also be a rise in liabilities to affiliated companies as internal capital markets play a significant role in groups, especially in crisis years. See Almeida et al. (2015).

¹⁰ Preliminary data from the Federal Statistical Office on the standard insolvency proceedings initiated in the first ten months of the current year point to a decline in corporate insolvencies in 2020 compared with the previous year. In March, the obligation to file for insolvency due to pandemic-related insolvency was suspended until 30 September 2020. This was extended in September for overindebted yet still solvent enterprises until 31 December 2020. Nevertheless, the data on the standard insolvency proceedings initiated in October 2020 are below those of the previous months despite the suspension of the obligation to file for insolvency having come to an end.

of paper issued by euro area MFIs. ⁹ Including national banknotes still in circulation. ¹⁰ The German contributions to the Eurosystem's monetary aggregates should on no account be interpreted as national monetary aggregates and are therefore not comparable with the erstwhile German money stocks M1, M2 or M3. ¹¹ The

difference between the volume of euro banknotes actually issued by the Bundesbank and the amount disclosed in accordance with the accounting regime chosen by the Eurosystem (see also footnote 2 on banknote circulation in Table III.2).

II. Overall monetary survey in the euro area

euro banknotes put into circulation by the Bundesbank in accordance with the accounting regime chosen by the Eurosystem (see also footnote 2 on banknote circulation in Table III.2). The volume of currency actually put into circulation by the

Bundesbank can be calculated by adding to this total the item "Intra-Eurosystem liability/claim related to banknote issue" (see "Other liability items"). ⁵ Excluding central governments' deposits. ⁶ In Germany, only savings deposits.

* Monetary financial institutions (MFIs) comprise banks (including building and loan associations), money market funds, and the European Central Bank and national central banks (the Eurosystem). ¹ Source: ECB. ² In Germany, only savings deposits. ³ Excluding holdings of MFIs; for the German contribution, excluding German MFIs' portfolios of securities issued by MFIs in the euro area. ⁴ In Germany, bank debt securities with maturities of up to one year are classed as money market paper.

⁵ Excluding liabilities arising from securities issued. ⁶ After deduction of inter-MFI participations. ⁷ The German contributions to the Eurosystem's monetary aggregates should on no account be interpreted as national monetary aggregates and are therefore not comparable with the erstwhile German money stocks M1, M2 or M3. ⁸ Including DEM banknotes still in circulation (see also footnote 4 on p. 10*). ⁹ For the German contribution, the difference between the volume of euro banknotes

Discrepancies may arise from rounding. * The banking system's liquidity position is defined as the current account holdings in euro of euro area credit institutions with the Eurosystem. Amounts are derived from the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. 1 Figures are daily averages for the reserve maintenance period ending in the month indicated. Following the changeover in the frequency of Governing Council monetary policy meetings to a six-week cycle, a reserve maintenance period no longer ends in every month. No

figures are available in such cases. 2 Source: ECB. 3 Includes liquidity provided under the Eurosystem's asset purchase programmes. 4 From August 2009 includes liquidity absorbed as a result of the Eurosystem's foreign exchange swap operations. 5 From 2002 euro banknotes and other banknotes which have been issued by the national central banks of the Eurosystem and which are still in circulation. In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is

allocated to the ECB on a monthly basis. The counterpart of this adjustment is shown under "Other factors". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly basis, to the NCBS, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro banknotes allocated to an NCB and the value of the euro banknotes which that NCB has put into circulation is likewise shown under "Other

factors". From 2003 euro banknotes only. **6** Remaining items in the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. **7** Equal to the difference between the sum of liquidity-providing factors and the sum of liquidity-absorbing factors. **8** Calculated as the sum of the "Deposit facility", "Banknotes in circulation" and "Credit institutions' current account balances".

III. Consolidated financial statement of the Eurosystem

1. Assets *

€ billion

As at reporting date	Total assets	Gold and gold receivables	Claims on non-euro area residents denominated in foreign currency			Claims on euro area residents denominated in foreign currency	Claims on non-euro area residents denominated in euro			
			Total	Receivables from the IMF	Balances with banks, security investments, external loans and other external assets		Total	Balances with banks, security investments and loans	Claims arising from the credit facility under ERM II

* The consolidated financial statement of the Eurosystem comprises the financial statement of the European Central Bank (ECB) and the financial statements of the national central banks of the euro area Member States (NCBs). The balance sheet items for foreign currency, securities, gold and financial instruments are valued at market

rates at the end of the quarter. ¹ In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is allocated to the ECB on a monthly basis. The counterpart of this adjustment is disclosed as an "Intra-Eurosystem liability related to

III. Consolidated financial statement of the Eurosystem

euro banknote issue". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly basis, to the NCBs, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro

banknotes allocated to the NCB according to the aforementioned accounting procedure and the value of euro banknotes put into circulation is also disclosed as an "Intra-Eurosystem claim/liability related to banknote issue". ² For the Deutsche Bundesbank: including DEM banknotes still in circulation. ³ Source: ECB.

IV. Banks

1. Assets and liabilities of monetary financial institutions (excluding the Deutsche Bundesbank) in Germany *

* This table serves to supplement the "Overall monetary survey" in Section II. Unlike the other tables in Section IV, this table includes - in addition to the figures reported by

banks (including building and loan associations) - data from money market funds. 1 See footnote 1 in Table IV.2. 2 Including debt securities arising from the exchange

IV. Banks

euro area										Claims on non-euro area residents			Period
to non-banks in other Member States										Total	of which: Loans	Other assets ¹	
General government				Total	Enterprises and households		General government		Securities

³ In Germany, debt securities with maturities of up to one year are classed as money market paper; up to the January 2002 Monthly Report they were published together

with money market fund shares. ⁴ Statistical breaks have been eliminated from the flow figures (see also footnote * in Table II.1).

IV. Banks

2. Principal assets and liabilities of banks (MFIs) in Germany, by category of banks*

* Assets and liabilities of monetary financial institutions (MFIs) in Germany. The assets and liabilities of foreign branches, of money market funds (which are also classified as MFIs) and of the Bundesbank are not included. For the definitions of the respective items, see the footnotes to Table IV.3. ¹ Owing to the Act Modernising Accounting Law (*Gesetz zur Modernisierung des Bilanzrechts*) of 25 May 2009, derivative financial instruments in the trading portfolio (trading portfolio derivatives) within the meaning of Section 340e(3) sentence 1 of the German Commercial Code (*Handels-*

gesetzbuch) read in conjunction with Section 35(1) number 1a of the Credit Institution Accounting Regulation (*Verordnung über die Rechnungslegung der Kredit-institute*) are classified under "Other assets and liabilities" as of the December 2010 reporting date. Trading portfolio derivatives are listed separately in Statistical Supplement 1 to the Monthly Report – Banking statistics, in Tables I.1 to I.3. ² For building and loan associations: including deposits under savings and loan contracts (see Table IV.12). ³ Included in time deposits. ⁴ Excluding deposits under savings and

¹ The reserve maintenance period starts on the settlement day of the main refinancing operation immediately following the meeting of the Governing Council of the ECB for which the discussion on the monetary policy stance is scheduled. ² Article 3 of the Regulation of the European Central Bank on the application of minimum reserves (excluding liabilities to which a reserve ratio of 0% applies, pursuant to Article 4(1)). ³ Amount after applying the reserve ratio to the reserve base. The reserve ratio for liabilities with agreed maturities of up to two years was

2% between 1 January 1999 and 17 January 2012. Since 18 January 2012, it has stood at 1%. ⁴ Article 5(2) of the Regulation of the European Central Bank on the application of minimum reserves. ⁵ Average credit balances of credit institutions at national central banks. ⁶ Average credit balances less required reserves after deduction of the lump-sum allowance. ⁷ Required reserves after deduction of the lump-sum allowance.

* The interest rate statistics gathered on a harmonised basis in the euro area from January 2003 are collected in Germany on a sample basis. The MFI interest rate statistics are based on the interest rates applied by MFIs and the related volumes of euro-denominated deposits and loans to households and non-financial corporations domiciled in the euro area. The household sector comprises individuals (including sole proprietors) and non-profit institutions serving households. Non-financial corporations include all enterprises other than insurance corporations, banks and other financial institutions. The most recent figures are in all cases to be regarded as provisional. Subsequent revisions appearing in the following Monthly Report are not specially marked. Further information on the MFI interest rate statistics can be found on the Bundesbank's website (Statistics/Money and capital markets/Interest rates and yields/Interest rates on deposits and loans). ^o The statistics on outstanding amounts are collected at the end of the month. ¹ The effective interest rates are calculated either as

annualised agreed interest rates or as narrowly defined effective rates. Both calculation methods cover all interest payments on deposits and loans but not any other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance. ² Data based on monthly balance sheet statistics. ³ Secured and unsecured loans for home purchase, including building and home improvements; including loans granted by building and loan associations and interim credits as well as transmitted loans granted by the reporting agents in their own name and for their own account. ⁴ Loans for consumption are defined as loans granted for the purpose of personal use in the consumption of goods and services. ⁵ For the purpose of these statistics, other loans are loans granted for other purposes such as business, debt consolidation, education, etc. ⁶ Including overdrafts (see also footnotes 12 to 14 on p. 47).

For footnotes * and 1 to 6, see p. 44*. For footnote x see p. 47*. + For deposits with an agreed maturity and all loans excluding revolving loans and overdrafts, credit card debt: new business covers all new agreements between households or non-financial corporations and the bank. The interest rates are calculated as volume-weighted average rates of all new agreements concluded during the reporting month. For overnight deposits, deposits redeemable at notice, revolving loans and overdrafts, credit card debt: new business is collected in the same way as outstanding amounts for the sake of simplicity. This means that all outstanding deposit and lending business at

the end of the month has to be incorporated in the calculation of average rates of interest. ⁷ Estimated. The volume of new business is extrapolated to form the underlying total using a grossing-up procedure. ⁸ Including non-financial corporations' deposits; including fidelity and growth premiums. ⁹ Excluding overdrafts. ¹⁰ Annual percentage rate of charge, which contains other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance.

For footnotes * and 1 to 6, see p. 44*. For footnotes + and 7 to 10, see p. 45*;
11 For the purposes of the interest rate statistics, a loan is considered to be secured if collateral (amongst others financial collateral, real estate collateral, debt securities) in at least the same value as the loan amount has been posted, pledged or assigned.
12 Including revolving loans which have all the following features: (a) the borrower may use or withdraw the funds to a pre-approved credit limit without giving prior notice to the lender; (b) the amount of available credit can increase and decrease as funds are borrowed and repaid; (c) the loan may be used repeatedly; (d) there is no obligation of regular repayment of funds. **13** Overdrafts are defined as debit balances

on current accounts. They include all bank overdrafts regardless of whether they are within or beyond the limits agreed between customers and the bank. **14** Including convenience and extended credit card debt. Convenience credit is defined as the credit granted at an interest rate of 0% in the period between payment transactions effected with the card during one billing cycle and the date at which the debt balances from this specific billing cycle become due. **15** The amount category refers to the single loan transaction considered as new business. **x** Dominated by the business of one or two banks. Therefore, the value cannot be published due to confidentiality.

Sources: The calculations for the insurance sectors are based on supervisory data according to Solvency I and II. Pension funds data are compiled using Solvency I supervisory data, supplemented by voluntary reports and own calculations. * Valuation of listed securities at the corresponding consistent price from the ESCB's securities database. ¹ Accounts receivable to monetary financial institutions, including registered bonds, borrowers' note loans and registered Pfandbriefe. ² Including deposits retained

on assumed reinsurance as well as registered bonds, borrowers' note loans and registered Pfandbriefe. ³ Not including the reinsurance business conducted by primary insurers, which is included there. ⁴ The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included.

Sources: The calculations for the insurance sectors are based on supervisory data according to Solvency I and II. Pension funds data are compiled using Solvency I supervisory data, supplemented by voluntary reports and own calculations. ¹ Including deposits retained on ceded business as well as registered bonds, borrowers' note loans and registered Pfandbriefe. ² Insurance technical reserves "life" taking account of transitional measures. Health insurance is also included in the "non-life insurance" sector.

³ Not including the reinsurance business conducted by primary insurers, which is included there. ⁴ The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included. ⁵ Own funds correspond to the sum of net worth and the liability item "Shares and other equity".

1 Bearer debt securities with maximum maturities according to the terms of issue of over 4 years. Structured debt securities, debt securities with unscheduled redemption, zero coupon bonds, floating rate notes and bonds not denominated in Euro are not included. Group yields for the various categories of securities are weighted by the amounts outstanding of the debt securities included in the calculation. Monthly figures

are calculated on the basis of the yields on all the business days in a month. The annual figures are the unweighted means of the monthly figures. Adjustment of the scope of securities included on 1 May 2020. 2 End of year or month. 3 Source: Deutsche Börse AG. 4 Only debt securities eligible as underlying instruments for futures contracts; calculated as unweighted averages.

Source: Bundesbank calculations based on Federal Statistical Office data. ¹ Annual figures based on the calculations of the Federal Statistical Office. Bundesbank supplementary estimations for the reporting years after 2011 that are not yet available. The quarterly figures contain numerous off-budget entities which are assigned to the general government sector as defined in the national accounts but are not yet included in the annual calculations. From 2012 also including the bad bank FMSW. ² The annual figures do not tally with the sum of the quarterly figures, as the

later are all provisional. The quarterly figures for some insurance sectors are estimated. ³ The development of the types of expenditure recorded here is influenced in part by statistical changeovers. ⁴ Including discrepancies in clearing transactions between central, state and local government. ⁵ On the revenue side, this contains proceeds booked as disposals of equity interests and as loan repayments. On the expenditure side, this contains the acquisition of equity interests and loans granted. ⁶ Including central government liquidity assistance to the Federal Employment Agency.

Source: Federal Ministry of Finance and Bundesbank calculations. **1** This total, unlike that in Table X. 5, does not include the receipts from the equalisation of burdens levies, local business tax (less local business tax transfers to central and state government), real property taxes and other local government taxes, or the balance of untransferred tax shares. **2** Respective percentage share of central, state and local government in revenue: wage tax and assessed income tax 42.5:42.5:15, corporation tax and non-assessed taxes on earnings 50:50:0, final withholding tax on interest income and capital gains, non-assessed taxes on earnings 44:44:12. **3** After

deducting child benefit and subsidies for supplementary private pension plans. **4** Final withholding tax on interest income and capital gains, non-assessed taxes on earnings. **5** The allocation of revenue to central, state and local government, which is adjusted at more regular intervals, is regulated in Section 1 of the Revenue Adjustment Act. Respective percentage share of central, state and local government in revenue for 2019: 48.9:47.7:3.4. The EU share is deducted from central government's share. **6** Respective percentage share of central and state government for 2019: 24.0:76.0. **7** For the breakdown, see Table X. 7.

Sources: Federal Statistical Office; Federal Employment Agency. * Annual and quarterly figures: averages; calculated by the Bundesbank; deviations from the official figures are due to rounding. 1 Workplace concept; averages. 2 Monthly figures: end of month. 3 Number within a given month. 4 Mid-month level. 5 Relative to the total civilian labour force. 6 Excluding government-assisted forms of employment and seasonal jobs, including jobs located abroad. 7 From January 2017 persons receiving additional income assistance (unemployment benefit and unemployment benefit II at the same time) shall be assigned to the legal category of the Third Book of the Social Security Code (SGB III) 8 Statistical break due to late recording of unemployed

persons in the legal category of the Second Book of the Social Security Code (SGB II). 9 Unadjusted figures estimated by the Federal Employment Agency. In 2018 and 2019, the estimated values for Germany deviated from the final data by a maximum of 0.1% for employees subject to social contributions, by a maximum of 0.7% for persons solely in jobs exempt from social contributions, and by a maximum of 55.3% for cyclically induced short-time work. 10 From May 2020, calculated on the basis of new labour force figures. 11 Initial preliminary estimate by the Federal Statistical Office.

* Non-financial groups admitted to the Prime Standard segment of the Frankfurt Stock Exchange which publish IFRS consolidated financial statements on a quarterly or half-yearly basis and make a noteworthy contribution to value added in Germany. In some cases revised. Excluding groups engaged in real estate activities. ¹ Including cash

equivalents. ² Including groups in agriculture and forestry. ³ From H1 2018 or 2018 onwards: significant changes in IFRS standards, impairing comparability with previous periods.

XI. Economic conditions in Germany

11. Revenues and operating income of listed non-financial groups *

Period	Revenues		Operating income before depreciation and amortisation (EBITDA 1)		Operating income before depreciation and amortisation (EBITDA 1) as a percentage of revenues						Operating income (EBIT) as a percentage of revenues						
					Weighted average		Distribution 2			Operating income (EBIT)		Weighted average		Distribution 2

* Non-financial groups admitted to the Prime Standard segment of the Frankfurt Stock Exchange which publish IFRS consolidated financial statements on a quarterly or half-yearly basis and make a noteworthy contribution to value added in Germany. In some cases revised. Excluding groups engaged in real estate activities. 1 Earnings before interest, taxes, depreciation and amortisation. 2 Quantile data are based on the groups' unweighted return on sales. 3 Annual figures do not always match the sum of

the two half-year figures. See Quality report on consolidated financial statement statistics, p. 3. 4 Adjusted for substantial changes in the basis of consolidation of large groups and in the reporting sample. See the explanatory notes in Statistical Series Seasonally adjusted business statistics. 5 Including groups in agriculture and forestry. 6 From this point onwards: significant changes in IFRS standards, impairing comparability with previous periods.

^o Assets and liabilities vis-à-vis all countries within and outside the euro area. Up to December 2000 the levels at the end of each quarter are shown, owing to revaluations, at market prices; within each quarter, however, the levels are computed on the basis of cumulative transaction values. From January 2001 all end-of-month levels are valued at market prices. ¹ Mainly net claims on TARGET2 balances (according to the

respective country designation), since November 2000 also balances with non-euro area central banks within the ESCB. ² Mainly long-term debt securities from issuers within the euro area. ³ Including estimates of currency in circulation abroad. ⁴ See Deutsche Bundesbank, Monthly Report, October 2014, p. 22. ⁵ Euro opening balance sheet of the Bundesbank as at 1 January 1999.

XII. External sector

9. External positions of enterprises *

€ million

* The assets and liabilities vis-à-vis non-residents of banks (MFIs) in Germany are shown in Table 4 of Section IV, "Banks". Statistical increases and decreases have not been

eliminated; to this extent, the changes in totals are not comparable with the figures shown in Table XII.7.

* The effective exchange rate corresponds to the weighted external value of the currency concerned. The method of calculating the indicators of the German economy's price competitiveness is consistent with the procedure used by the ECB to compute the effective exchange rates of the euro. A decline in the figures implies an increase in competitiveness. The weights are based on trade in manufactured goods and, as from the publication of 1 July 2020, additionally on trade in services. For more detailed information on methodology, see the website of the Deutsche Bundesbank (<https://www.bundesbank.de/content/796162>). ¹ ECB calculations are based on the weighted averages of the changes in the bilateral exchange rates of the euro vis-à-vis the currencies of the following countries: Australia, Bulgaria, Canada, China, Croatia, Czechia, Denmark, Hong Kong, Hungary, Japan, Norway, Poland, Romania, Singapore, South Korea, Sweden, Switzerland, the United Kingdom and the United States. Where current price and wage indices were not available, estimates

were used. ² ECB calculations. Includes countries belonging to the group EER-19 and additionally Algeria, Argentina, Brazil, Chile, Colombia, Iceland, India, Indonesia, Israel, Malaysia, Mexico, Morocco, New Zealand, Peru, Philippines, the Russian Federation, Saudi Arabia, South Africa, Taiwan, Thailand, Turkey, Ukraine and the United Arab Emirates. ³ Annual and quarterly averages. ⁴ Euro area countries (from 2001 including Greece, from 2007 including Slovenia, from 2008 including Cyprus and Malta, from 2009 including Slovakia, from 2011 including Estonia, from 2014 including Latvia, from 2015 including Lithuania) as well as Canada, Denmark, Japan, Norway, Sweden, Switzerland, the United Kingdom and the United States. ⁵ Euro area countries (current composition) and countries belonging to the group EER-19. ⁶ Euro area countries (current composition) and countries belonging to the group EER-42.

Overview of publications by the Deutsche Bundesbank

This overview provides information about selected recent economic and statistical publications by the Deutsche Bundesbank. Unless otherwise indicated, these publications are available in both English and German, in printed form and on the Bundesbank's website.

The printed publications are available free of charge to interested parties and may be obtained through the Bundesbank's order portal. Up-to-date figures for selected statistical datasets are available on the Bundesbank's website. In addition, the new Statistical Series provide a new basic structure and advanced options for using data and are also available on the Bundesbank's website.

■ Annual Report

■ Financial Stability Review

■ Monthly Report

For information on the articles published between 2010 and 2019, see the index attached to the January 2020 Monthly Report.

Monthly Report articles

January 2020

- The upswing in loans to enterprises in Germany between 2014 and 2019
- Consequences of increasing protectionism
