The German original of this Monthly Report
went to press at 11 a.m. on 18 June 2021.

Publishing schedules for selected statistics can
be downloaded from our website. The statisti-
cal data are also published on the website.

The Monthly Report is published by the
Deutsche Bundesbank, Frankfurt am Main, by
virtue of Section 18 of the Bundesbank Act. It is
available to interested parties free of charge.

This is a translation of the original German
language version, which is the sole authorita-
tive text.

■ Economic conditions

Underlying trends

German economy returns to path of recovery in Q2

German economic output is likely to rise steeply again in the second quarter of 2021 following the first-quarter setback,¹ largely on the back of activity in the services sector. There has been a strong decline in the number of new COVID-19 cases as a result of the decision to apply the “emergency brake” to contain the coronavirus pandemic at the end of April, the other containment measures and considerable progress in the vaccination campaign. As early as May, many of the previously imposed restrictions had either been eased to a significant extent or even lifted altogether, with services such as the hotel and restaurant sector and the wholesale and retail trade likely to have been the main beneficiaries. This caused business expectations in these sectors to improve strongly. On the other hand, other burdens only indirectly related to the pandemic are shaping economic activity. As in the first quarter, increased supply bottlenecks, mainly for intermediate goods such as semiconductors, are placing a dampener on production, particularly in the automotive industry. Similarly, there have been mounting reports, most recently from the construction sector as well, about material shortages for intermediate products such as wood, steel and insulation materials. That said, the majority of industrial enterprises anticipate a further improvement in their business activity, according to the ifo Institute’s latest surveys. This suggests that the strains caused by the supply bottlenecks are limited.

Industry

Industrial output down somewhat in April

Industrial output declined again somewhat in April 2021 following a brief recovery in March. After seasonal and calendar adjustment, it was down by $\frac{3}{4}$ % on both the previous month and

the first quarter. Bottlenecks in the supply of intermediate goods, which had already impaired production in the first quarter, also played an important role at the beginning of the second quarter. They will probably continue to dampen industrial output in the next few months.² The automotive sector is still particularly affected by shortages of semiconductors, with output falling again in April, by around 6%, on what had already been a distinctly subdued previous quarter. Seasonally and calendar-adjusted auto production numbers experienced another substantial decline in May, according to data from the German Association of the Automotive Industry (VDA). Broken down by main groups, the production of intermediate goods remained unchanged in April compared with the first quarter of 2021. Output of consumer and capital goods, by contrast, was down significantly, but at least registered a marked increase if the automotive sector is excluded. All in all, industrial output still lagged 4% behind the pre-crisis level of the fourth quarter of 2019.

In April, industrial orders remained at the high level of March, which had undergone a significant upward revision. In fact, seasonally adjusted orders remained on a clear upward path if volatile large orders are excluded. Overall, orders in April were up again, by a substantial 3%, on the already strong figures for the previous quarter. Broken down by sector, demand for intermediate goods now only rose at a slow pace compared with the previous quarter. Demand for capital goods and, in particular, consumer goods picked up significantly, meanwhile, with new orders in the automotive sector recording an above-average rise. In a regional breakdown, German industrial enterprises benefited from

Industrial orders persistently high

¹ For further information on the macroeconomic outlook, see pp. 15-38 of this Monthly Report.

² According to the ifo Institute, the share of industrial enterprises reporting that their production was being hampered by material shortages rose to the highest level since the time series was first recorded for Germany as a whole.

Deutsche Bundesbank

lively foreign demand, mainly from non-euro area countries, while domestic demand now only experienced marginal growth. In April, industrial orders surpassed the pre-crisis level by an impressive 12%, implying that demand is significantly outstripping industrial output.

Like industrial output, nominal industrial sales were down significantly in April, posting a seasonally adjusted decline of 1¾% on the previous month, in which they had seen a considerable increase. Compared with the previous quarter, however, sales were virtually unchanged, and excluding other transport equipment, which is prone to fluctuation, even rose by 1¼%. Broken down by sector, April saw strong growth for intermediate goods and significant decreases for consumer goods and primarily capital goods compared with the previous quarter. In regional terms, domestic sales remained virtually unchanged, while foreign sales saw steep growth in the euro area being offset by losses in non-euro area countries.

Industrial sales down again significantly in April

Nominal goods exports in April recorded only a slight seasonally adjusted rise on the month, but were nonetheless well up on the first quarter of 2021 (+1½%). One striking feature was the strong decline in the value of exports to China. In real terms, however, total exports to both euro area and non-euro area countries remained broadly unchanged compared with the first quarter, which means that they were still 1½% down on the pre-crisis level. Goods imports, meanwhile, registered declines on the strong previous month that were significant in nominal terms and worse still in real terms. Compared with the previous quarter, though, a strong rise in imports from non-euro area countries left goods imports a significant 1% higher in real terms. They exceeded their pre-crisis level to a similar extent.

Exports of goods broadly unchanged in April

Construction

After seasonal adjustment, construction output recorded a sharp decline in April 2021 com-

Sharp decline in construction output in April

pared with the exceptionally robust March, though it did exceed the average of the first quarter (+1¼%), with finishing trades up significantly. The main construction sector posted a strong decrease, however. Building construction and civil engineering were affected to a similar degree. Bottlenecks in the supply of intermediate products and construction materials are also likely to have hampered output in the construction sector recently. According to the ifo Institute, 18% of firms in the main construction sector reported that material shortages were impeding construction activity in April, rising to as many as 37½% in May, after coming in just short of 4% in the first quarter. These problems are mainly attributable to the brisk demand and the resulting rapid rise in the prices of lumber, steel, insulation and various synthetic materials, for example.³ The ifo Institute found that equipment utilisation had stagnated in the main construction sector in May, leaving it above its long-term average.

Labour market

Short-time work declines substantially in March for first time since last October

With the pandemic fading and the vaccination campaign making progress, optimism is gradually gaining the upper hand in the labour market as well. Provisional figures from the Federal Employment Agency indicate that the still large number of persons in cyclically induced short-time work fell significantly to 2.61 million in March. This decline is in line with the easing of the containment measures. Nevertheless, the loss of working hours per short-time worker is still very high and barely down compared with February. This means the volume of labour lost through short-time work was still twice as high as it was shortly before the measures taken to combat the pandemic were tightened in October 2020. The number of short-time workers is likely to have gone down further since March. Based on its own surveys, the ifo Institute believes that there were still nearly 2.3 million people in short-time work in May.⁴ The number of registrations for short-time work dropped to

a very moderate level over the past few months up to May.

Employment remained on its modest growth path in April despite restrictions being tightened again to counter the rising incidence of infections at the time. Employment subject to social security contributions (according to data as of March) saw a positive development, while exclusively low-paid part-time employment and self-employment continued to decline. Indicators of willingness to recruit new staff increasingly show that labour market conditions are expected to improve in the near future. The number of vacancies rose again.

Employment mildly expansionary

Registered unemployment was down slightly in May. The decline by a seasonally adjusted 15,000 persons was too small to change the unemployment rate, however, which remained constant at 6.0%. While unemployment driven more by cyclical factors was already registering a further slight decline during the fourth quarter of 2020 and the first quarter of 2021, more long-term unemployed persons switched to the basic welfare allowance after more than a year of pandemic conditions. The IAB's unemployment barometer rose to an extremely optimistic level in May; unemployment is likely to fall swiftly in the next three months.

Unemployment down slightly in May; outlook upbeat

Prices

Crude oil prices resumed their upward trajectory in May 2021 after experiencing a brief setback, mainly on the back of improving medium-term demand prospects and the continued rigorous implementation of production cuts by OPEC and its partners. Crude oil prices were approximately 5% up on April, leaving them roughly twice as high as they had been one year previously. They continued to edge up in June. As this report went to press, the price of a barrel of Brent crude oil stood at US\$73.

Crude oil prices pointing upwards recently

³ See ifo Institute (2021a).

⁴ See ifo Institute (2021b).

Crude oil futures were trading at marked discounts. The discount on crude oil futures was US\$3¼ for deliveries six months ahead and US\$6 for deliveries 12 months ahead.

Import and producer prices continue to rise steeply

Import prices continued to rise steeply in April, with non-energy products once again becoming significantly more expensive. By contrast, the hike in energy prices eased off. Industrial producer prices, for which data up to May are already available, paint a similar picture with a lower amplitude. Energy prices were up again here towards the end of the period under review. Import prices and industrial producer prices recently outstripped their prior-year levels, exceeding them by just over 10% and roughly 7%, respectively.

Consumer prices also rising persistently

Consumer prices as measured by the Harmonised Index of Consumer Prices (HICP) increased by a seasonally adjusted 0.3% in May and thus at a similar rate as in April.⁵ Prices of industrial goods excluding energy in particular rose steeply, affecting clothing, whose prices normally fluctuate sharply, and other goods. This took clothing prices more or less back to levels last seen before the first wave of the coronavirus pandemic began in March 2020. Prices of other non-energy industrial goods were already significantly above pre-pandemic levels again. Inflation was moderate for the other HICP components, however. Annual headline HICP inflation went up from 2.1% to 2.4%,⁶ while the core rate excluding energy and food rose from 1.1% to 1.6%. The increase was partly attributable to the relatively early Whitsun holiday, which meant that travel prices, in particular, were clearly higher than they had been one year earlier. However, even excluding this component and clothing, inflation climbed from 1.4% to 1.6%. Headline HICP inflation is likely to slow again temporarily in the current month, partly due to the countervailing effect of the Whitsun holiday. Starting in July, however, the base effect of the temporary cut in VAT rates in 2020⁷ means that inflation can be expected to return to significantly higher rates, even if a one-off statistical effect will still have a damp-

ening impact in the first instance. This effect is due to the fairly strong pandemic-driven adjustment of some HICP weights to the consumption habits of 2020. It caused the inflation rate to rise markedly in the first quarter of 2021 and will dampen it significantly at times from July to October.⁸ As things stand today, rates of around 4% are possible in the short term if this waning effect abates towards the end of the year.⁹

■ Public finances¹⁰

Public long-term care insurance scheme

The public long-term care insurance scheme posted a considerable deficit of almost €1½ billion in the core area in the first quarter of 2021.¹¹ Last year, the first quarter was barely affected by the coronavirus crisis, and the result was broadly balanced. It was primarily pandemic-related special payments to long-term care facilities that led to the distinct deterioration in the financial situation.

Considerable deficit in Q1 due to pandemic-related special payments to long-term care facilities

Total revenue increased by 3½%. Although employees' contributions saw a muted increase, they were bolstered by contributions made for short-time workers. In addition, revenue from

⁵ Since the measures to contain the coronavirus pandemic were relaxed, only around one-tenth of all prices had to be imputed. See also Federal Statistical Office (2021).

⁶ The annual rate of consumer inflation according to the national Consumer Price Index (CPI) rose from 2.0% to 2.5%.

⁷ See Deutsche Bundesbank (2020).

⁸ See Deutsche Bundesbank (2021).

⁹ For further details, please see pp. 15-38 of this Monthly Report.

¹⁰ In the short commentaries on public finances, the emphasis is on recent outturns. The quarterly editions of the Monthly Report (published in February, May, August and November), by contrast, contain an in-depth description of public finance developments during the preceding quarter. For detailed data on budgetary developments and public debt, see the statistical section of this report.

¹¹ The developments outlined here and in the remainder of the text exclude the provident fund. This includes transfers amounting to around 0.1 percentage point of the core area contribution rate. Assets accumulated in this way are to be depleted again in the 2030s to dampen the expected contribution rate rise.

Revenue bolstered by contributions on short-time working benefits and unemployment benefits

contributions for recipients of unemployment benefit rose sharply. Contributions payable on pensions saw stable growth, unaffected by the pandemic. Expenditure rose very steeply, by 16½%. Even excluding the aforementioned special payments of €1½ billion to long-term care facilities,¹² it still saw dynamic growth of 4%. With benefit rates unchanged, cash benefits experienced sustained strong growth, at 11%. By contrast, spending on non-cash benefits, a larger expenditure item, remained virtually unchanged on the year. Pandemic-related restrictions on the number of people admitted to residential care, not least, may have contributed to this.

Significant deficit for year as a whole, too, due to coronavirus special expenses and discontinued central government funds

For the year as a whole, too, the coronavirus crisis is likely to weigh on the finances of the long-term care insurance scheme. Compared with 2020 (surplus: €1½ billion), the result could deteriorate by around €4 billion. The revenue side will be affected by the absence of last year's central government payments of just under €2 billion to cushion special coronavirus burdens. In addition, the contribution base is likely to increase only moderately as a result of labour market growth initially remaining muted. On the expenditure side, the coronavirus-related special payments to long-term care facilities run until the middle of the year. For the year as a whole, therefore, they could stand at about the same level as the previous year, at around €3 billion. Furthermore, the underlying pace of expenditure growth is set to be rather high for the year in its entirety, too. This is chiefly attributable to the ongoing impact of benefit expansions from previous years. However, an initially planned further benefit increase will not take place this year and will be implemented, in part, next year.¹³ This year's expected deficit will erode the general reserve. However, as the contribution rate was raised by a very significant 0.5 percentage point in 2019, the reserve is well-stocked (end-2020: €8½ billion or almost 20% of annual expenditure). There is, therefore, no risk of the general reserve undershooting its lower limit of half of one month's expenditure in 2021.

Finances of the public long-term care insurance scheme*

Source: Federal Ministry of Health. * Preliminary quarterly figures. The final annual figures differ from the total of the reported preliminary quarterly figures as the latter are not revised subsequently. ¹ Including transfers to the long-term care provident fund.
 Deutsche Bundesbank

Next year, it is likely that the economy will make a significant recovery and the long-term care insurance scheme will not make any more coronavirus-related special payments. The fi-

¹² The institutions receive financial compensation for lost income from long-term care services due to the COVID-19 crisis (for example, as a result of a facility closing or freezing admission of new care recipients to curb the risk of infection). In addition, the long-term care insurance scheme reimbursed non-residential and (partially) residential long-term care facilities for COVID-19 testing costs.

¹³ At the end of last year, the Federal Government did in fact identify a need for adjustment for all benefit rates of 5% for 2021. This was based on the cumulative consumer price inflation from 2017 to 2019. The benefit rates for non-cash care benefits and short-term care will now be raised next year. No further dynamic adjustment is yet planned for nursing benefits.

Coronavirus burdens to expire in 2022, but additional burdens caused by long-term care reform

stances of the long-term care insurance scheme will profit from this on the revenue and expenditure sides. This will still be the case even if non-cash benefits are once again taken up on a larger scale once the restrictions expire. However, significant additional burdens would emerge from the planned reform of the long-term care insurance scheme. Under this reform, the scheme is to reimburse care recipients a growing share of costs as the amount of time spent in a care home increases.¹⁴ The associated additional expenditure by the long-term care insurance scheme will increase due to another component of the reform efforts; as of September 2022, long-term care facilities will have to remunerate their staff in line with collective wage agreements in order to have their long-term care costs co-funded by the long-term care insurance scheme. Finally, the benefit rates for non-cash care benefits and short-term care are set to be raised on 1 January 2022. The Federal Ministry of Health calculates the long-term care insurance scheme's costs for these three measures at around €3 billion in 2022. From 2022 onwards, central government will provide an annual grant of €1 billion towards these costs. Furthermore, the supplementary contribution rate for childless persons is set to rise by 0.1 percentage point to 0.35% (meaning that they will pay 3.4% overall). This is expected to generate additional receipts of just under €½ billion.

Deficit could decline somewhat in 2022, but strong pressure to raise contribution rates in future

All in all, the long-term care insurance scheme is likely to book another significant deficit in 2022, though it may be somewhat down on the current year. However, demographic change will put the scheme's finances under substantial pressure in the medium to long term. This is because it will cause expenditure to rise dynamically and the revenue base to grow more slowly. Overall, therefore, considerably increased contribution rates are on the cards. The planned benefit expansions would heighten demographic spending pressures. By contrast, the partially compensatory measures on the revenue side would lose importance in relative terms over time.

Some see a higher central government grant as a way out of the public long-term care insurance scheme's looming financial problems. However, there is clearly no leeway for this in the Federal budget. Tax increases, or cuts in other areas, would therefore be necessary. Should the possibility of a larger financial contribution from central government be considered, more transparency with regard to the specific longer-term needs and concrete funding would be crucial. Another idea under discussion is that of expanding the public long-term care insurance scheme from a partial to a relatively comprehensive full insurance model. This would significantly exacerbate the existing financial problems. It would compound the substantial pressure to raise contribution rates, which also weighs on the statutory health and pension insurance schemes. With respect to expanding the existing range of long-term care benefits, it should also be noted that means-tested assistance for long-term care is already available to care recipients if their own financial means do not suffice for this purpose. An expansion in benefits would therefore primarily preserve private wealth. In the discussion about expanding the long-term care insurance scheme, too, it would at all events be essential to thoroughly disclose and weigh up the financial impact and the envisaged funding.

Lack of transparency regarding long-term care insurance scheme

¹⁴ Fixed residential care costs currently have four components: a facility-specific uniform residents' co-contribution, the facility's staff training costs, costs of accommodation and meals, and the facility's investment expenses. At the start of 2021, these outlays totalled an average of around €2,150 per month, according to data from the German association of substitute health insurance schemes (*Verband der Ersatzkassen*). Long-term care co-contributions and training costs currently make up around 42% of this figure (roughly €900). The former are now set to be reimbursed by up to 70%, as the duration of residential care increases. This will considerably ease the burden on care recipients who do not obtain assistance for long-term care (previously: social assistance).

■ Securities markets

Bond market

Lower net sales in the German bond market

At €146.9 billion, gross issuance in the German bond market in April was down on the previous month's level (€182.1 billion). After deducting redemptions and taking account of changes in issuers' holdings of their own bonds, net domestic bond issuance amounted to €12.4 billion. Foreign debt securities worth €3.8 billion net were placed in the German market. The outstanding volume of debt securities in Germany therefore rose by €16.2 billion in April.

Slight rise in public sector capital market debt

In April, the public sector issued bonds totalling €9.1 billion net (March: €17.2 billion). Central government expanded its capital market debt by €7.3 billion. It issued mainly ten-year and 15-year bonds (Bunds: €7.7 billion and €6.5 billion respectively), two-year Federal Treasury notes (Schätze: €4.7 billion) and seven-year Federal bonds (Bunds: €3.4 billion). This contrasted with net redemptions of five-year Federal notes (Bobls) amounting to €16.0 billion. State and local governments issued debt securities with a net value of €1.8 billion.

Net issuance by enterprises

In the reporting month, domestic enterprises increased their capital market debt by €6.0 billion net, compared with €0.6 billion in the previous month. Non-financial corporations and other financial intermediaries issued bonds for €3.2 billion and €2.9 billion net respectively.

Fall in credit institutions' capital market debt

By comparison, domestic credit institutions reduced their capital market debt by €2.7 billion in April, following net issuance of €21.8 billion in the previous month. Viewed in net terms, the redemptions were attributable solely to debt securities issued by specialised credit institutions (-€4.0 billion). On the other hand, mortgage Pfandbriefe and other bank debt securities that can be structured flexibly saw net issuance, albeit at a low volume (€0.7 billion and €0.4 billion respectively).

¹ Net sales at market values adjusted for changes in issuers' holdings of their own debt securities. ² Transaction values. ³ Book values, statistically adjusted. ⁴ Residual.
 Deutsche Bundesbank

The Bundesbank and domestic non-banks were, on balance, the sole purchasers in April. The Bundesbank acquired bonds amounting to €24.1 billion net, predominantly under the Eurosystem's asset purchase programmes. Domestic non-banks purchased debt securities for €19.1 billion net, the vast majority of which were foreign instruments (€13.9 billion). By contrast, German credit institutions sold bonds totalling €17.6 billion net. Non-resident investors also reduced their holdings of German debt securities on balance (-€9.4 billion).

Purchases of debt securities

Equity market

In April, domestic enterprises placed €0.9 billion worth of new shares in the German equity market, following €9.0 billion in March. The outstanding volume of foreign shares in the German market increased by €2.4 billion. On balance, shares were purchased chiefly by domestic non-banks (€3.9 billion), followed by

Deutsche Bundesbank

domestic credit institutions (€1.8 billion). Non-resident investors trimmed their share portfolios by €2.4 billion net.

Mutual funds

Domestic mutual funds recorded inflows of €10.9 billion in April, compared with €13.7 billion in March. The money benefited predominantly specialised funds reserved for institutional investors (€7.7 billion). Of the various asset classes, mixed securities funds in particular attracted the most inflows (€7.9 billion), followed by equity funds (€2.9 billion), funds of funds (€1.1 billion) and open-end real estate funds (€0.9 billion). Bond-based funds, on the other hand, recorded outflows of funds (-€2.8 billion). The outstanding volume of foreign mutual fund shares distributed in the German market rose by €9.3 billion in April. German non-banks were, on balance, by far the main purchasers of investment fund shares (€17.3 billion). Foreign investors and German credit institutions acquired mutual fund shares worth €1.6 billion and €1.3 billion net respectively.

Moderate inflows to mutual funds

Balance of payments

In April 2021, Germany's current account recorded a surplus of €21.3 billion, down €8.7 billion on the previous month's level. This was driven by the decrease in the goods account surplus and a narrowed surplus on invisible current transactions, comprising primary and secondary income as well as services.

Sharp decrease in current account surplus

In April, the surplus in the goods account fell by €6.2 billion on the month to €16.7 billion, with goods exports falling more sharply than imports.

Narrower surplus in goods account

The surplus in invisible current transactions fell by €2.5 billion to €4.6 billion in April, largely because net receipts in primary income contracted by €3.8 billion to €6.5 billion. This was particularly driven by higher dividend payments

Decline in primary income balance

to non-residents for portfolio investments. By contrast, the surplus in services rose slightly by €0.7 billion to €2.1 billion. Expenditure declined more sharply than receipts, which is also because expenditure for other business services and telecommunications, computer and information services decreased more strongly than the income they generated. In addition, the deficit in secondary income fell by €0.6 billion to €3.9 billion, with lower non-government sector expenditure playing a role in particular.

to the tune of €1.6 billion. In April, financial derivatives again recorded net capital exports: these amounted to €4.7 billion.

Direct investment saw net capital imports of €7.3 billion in April (following net capital exports of €21.7 billion in March). Non-resident investors injected their affiliated enterprises in Germany with direct investment funds worth €7.4 billion net. They increased their equity by €1.6 billion and provided €5.8 billion via intra-group lending. German enterprises made net direct investment flows of €0.1 billion abroad. The increases they made to their equity capital in branches abroad of €5.3 billion were offset by negative net lending to affiliates abroad of roughly the same amount (€5.2 billion).

Direct investment sees capital inflows

Other statistically recorded investment – which comprises loans and trade credits (where these do not constitute direct investment), bank deposits and other investments – registered net capital imports amounting to €9.9 billion in April (following net capital exports of €20.5 billion in March). Bundesbank accounts also recorded net capital imports (€14.5 billion). This was caused by a €57.3 billion decrease in TARGET2 claims on the ECB; non-residents' deposits with the Bundesbank likewise declined, albeit to a lesser extent. Transactions by enterprises and households (€3.1 billion) and by general government (€2.6 billion) also led to net inflows of funds from abroad. Monetary financial institutions (excluding the Bundesbank), on the other hand, recorded net capital exports (€10.3 billion).

Net capital imports in other investment

The Bundesbank's reserve assets fell slightly – at transaction values – by €0.3 billion in April.

Reserve assets

Portfolio investment sees net capital exports

In April 2021, developments in the international financial markets continued to be influenced by the coronavirus pandemic, but also by the growth outlook brightening in some areas. It was against this backdrop that Germany's cross-border portfolio investment recorded net capital exports of €25.4 billion (following net capital imports of €4.9 billion in March). Domestic investors added €15.2 billion worth of securities issued by non-residents to their portfolios. They purchased foreign securities in all asset classes; mainly mutual fund shares (€9.3 billion) but also bonds (€2.6 billion), shares (€2.1 billion) and money market paper (€1.3 billion). They primarily invested in bonds denominated in foreign currencies, while divesting themselves of long-dated euro-denominated securities on balance. Conversely, foreign investors disposed of €10.2 billion net worth of German securities, chiefly reducing their holdings of German debt securities (€9.4 billion), including both bonds (€5.7 billion) and money market paper (€3.8 billion). They sold public sector bonds and acquired long-dated securities issued by the German private sector. Foreign investors sold shares of German enterprises in the amount of €2.4 billion, while stocking up on mutual fund shares in Germany

Outlook for the German economy for 2021 to 2023

The German economy is overcoming the coronavirus crisis and is poised for the start of a strong upswing. This is contingent on the pandemic being quickly and sustainably suppressed by a successful vaccination programme, which will allow protective measures to be swiftly rolled back. As a result, households will again have access to opportunities for consumption that were previously closed off, and private consumption will see exceptionally strong growth over the rest of this year and in 2022 in particular. A portion of the involuntary savings built up during the course of pandemic will be spent, giving private consumption an additional boost. In addition to this, the upswing will be driven by exports as these benefit from the recovery in global trade, which will level off only gradually.

Given these conditions, real gross domestic product (GDP) will grow in calendar-adjusted terms, rising by slightly less than 4% this year and just over 5% next year. In 2023, this growth will decelerate but still amount to nearly 2%. Pre-crisis levels will be reattained as early as this summer. Aggregate capacity utilisation will reach an above-average level from as early as next year.

This year, the rate of inflation as measured by the Harmonised Index of Consumer Prices (HICP) will rise strongly to 2.6%. The main factors behind this are value added tax (VAT) rates, which were raised back to their previous levels, the newly introduced CO₂ emission certificates, as well as the sharp rises in prices for crude oil and food products. It is possible that inflation rates could amount to around 4% towards the end of the year. By contrast, the core rate excluding energy and food is only likely to stand at around slightly more than 1% – also adjusted for the VAT effect – as it had in the previous year. By 2023, it could rise to 1.7% as a result of the upswing, the improved labour market situation, and renewed stronger wage growth. As energy and food will then no longer exert above-average upward pressure on prices, headline inflation will likewise abate to 1.7%.

Public finances will continue to significantly bolster the economy in the current year as well. In this context, the deficit and debt ratios will continue to rise to more than 5% and more than 70% respectively. They will both then go back down considerably in the coming years, as the economy recovers and the fiscal crisis assistance measures expire or are scaled back.

Compared with the December 2020 outlook, considerably higher GDP is expected over the entire projection horizon. In line with the stronger upswing, the rate of inflation excluding energy and food is projected to also be somewhat higher over this period. Furthermore, headline consumer price inflation for this and next year is now expected to be significantly higher mainly because energy prices are rising considerably faster than anticipated back in December. While the risks to economic growth seem balanced as things stand today, the risks to price developments are tilted to the upside.

German economic recovery suffers considerable setback due to pandemic in Q4 2020 and Q1 2021 ...

Economic outlook¹

The German economy continued to suffer due to the coronavirus pandemic in the final quarter of 2020 and the first quarter of 2021. After the pandemic situation had reintensified in the autumn of 2020, government containment measures were considerably tightened once again. As during the first wave of the pandemic in the spring of 2020, this had a hard impact on certain services sectors such as hotel and restaurant services, cultural activities, and parts of the bricks-and-mortar retail trade sector in particular. As opportunities for consumption were unavailable, the household saving ratio

recently nearly reattained the record level seen in the second quarter of 2020. Conversely, private consumption, which had previously experienced a robust recovery, collapsed once again. By contrast, economic sectors that were not directly affected by the pandemic containment measures, such as construction and industry, recorded surprisingly strong expansion. The latter benefited from the swift recovery in global trade, which was reflected in sharp growth in exports. However, the rapidly rising demand for industrial goods around the world in conjunction with supply-side disruptions led to increasing supply bottlenecks for some intermediate goods. Due to a shortage of semiconductors, for example, motor vehicle production had to be throttled in the fourth quarter. In the final quarter of 2020 and the first quarter of 2021 combined, real GDP fell by a total of 1.3% after seasonal and calendar adjustment. This was a marginally greater decline than had been expected in the projection from December 2020.² At the beginning of the year, real GDP fell short of its pre-crisis level from the fourth quarter of 2019 by 5%.

In the second and third quarters of 2021, it is likely that the German economy will overcome this setback and see strong growth. The numbers of coronavirus infections have been in considerable decline since the end of April, and the pandemic containment measures have, with some regional variations, already been eased extensively. This projection assumes that the pandemic – underpinned by a successful vaccination programme in particular – will also continue to be quickly and sustainably suppressed going forward. As a consequence, the containment measures will probably be further eased to a significant extent over the coming months. This will result in substantial catch-up effects, primarily in private consumption as well as in services sectors that had been impacted especially hard by the measures. Exports should

... but significant easing of protective measures in Q2 and Q3 2021 provides strong boost once again

– driven by persistently brisk foreign demand – also see additional robust growth. However, like industrial production, they are likely to still be stifled somewhat by supply bottlenecks for intermediate goods, particularly in the second quarter. The very favourable overall outlook is reflected in the considerable improvement in business expectations among German enterprises over recent months, as reported by the ifo Institute. All in all, GDP could return to its pre-crisis level as early as the third quarter of 2021.

Strong economic growth loses momentum only as of 2023

Over the remainder of the projection horizon, it is also likely that the German economy will grow with great momentum at first. The large gains in exports will level off only gradually. This, in conjunction with a high level of capacity utilisation in industry, will bolster business investment. Above all, however, private consumption will continue to see exceptionally strong growth and will remain the key driving force behind the robust upswing. This assumes that pandemic-related restrictions will expire in the first few months of next year. For a time, private consumption will then overshoot its expansionary path resulting from income growth, as a portion of the additional savings built up during the pandemic will be spent. This surge will reverse itself towards the end of the projection horizon. The saving ratio will then again rise slowly from a low starting level, which will cause private consumption to grow at a slower pace than real disposable household income over the course of 2023.³ The latter will rise at increasingly faster rates over the projection horizon due to improvements on the labour market. The fiscal assistance that extensively mitigated income losses in 2020 and 2021 will mostly expire in 2022.

GDP level significantly higher than projected in December 2020

Overall, this presents a very favourable outlook for the German economy: the swift recovery from the crisis will continue with an upswing that proceeds strongly for a time but then

³ With regard to the annual average growth rates, this is still concealed by the large overhang from 2022.

gradually loses momentum again towards the end of the projection horizon. Following the massive collapse of 5% last year, calendar-adjusted real GDP could be able to make significant gains this year and next, growing by slightly less than 4% in 2021 and just over 5% in 2022. In 2023, this growth will lose momentum but then still amount to nearly 2%. Here, looking at the annual averages obscures the fact that GDP will rise by almost 5% over the course of this year and that annual growth will already drop below 3% during next year. In comparison with the projection from December 2020, not only will economic output return to its pre-crisis level half a year earlier than expected, but considerably higher GDP is also anticipated for the entire projection horizon. The key factor for this is higher foreign demand resulting in greater exports.

As a result of the strong upswing following the coronavirus crisis, economic output will exceed long-term potential output as early as 2022, meaning that aggregate capacity will be utilised to an above-average degree. This assumes that the pandemic will depress potential output at the projection horizon by only slightly less than 1%. The growth rate of potential output is estimated at 1.0% for this year. In each of the next two years, it will then rise to 1.2% primarily as a result of renewed increased expenditure for fixed capital formation.

Above-average aggregate capacity utilisation as early as 2022

In the fourth quarter of 2020 and the first quarter of 2021, exports grew to a considerably greater extent than had previously been expected. Global trade recovered despite the intensification of the pandemic in many countries, and German industry was met with brisk foreign demand. In addition, there was an improvement in the medium-term underlying conditions as the European Union and the United Kingdom reached a trade agreement before the end of the year. Furthermore, international trade relations are likely to have become more predictable following the transition to the new US administration. Against this background, enterprises' short-term export ex-

Exports initially see strong underlying trend growth ...

Underlying conditions for macroeconomic projections

This projection is based on assumptions made by Eurosystem experts about the global economy, exchange rates, commodity prices and interest rates. They are based on information available as at 18 May 2021. The assumptions regarding economic activity in the euro area are derived from projections made by the national central banks of the euro area countries.¹ These projections incorporate the fiscal policy measures which have been either adopted or adequately specified and are deemed likely to be implemented.

With regard to the coronavirus pandemic, it is assumed that the vaccination campaign in the European Union (EU) will continue successfully. This means that the containment measures may be eased quickly over the rest of the year and largely elapse in the first months of 2022.

Global economy continues recovery process

Global economic activity recovered more quickly in the final quarter of 2020 than expected in the December outlook. Although resurging infection counts in various regions of the world and the ensuing containment measures likely had a more considerable dampening effect on economic growth in the first quarter of 2021 than previously expected, global economic activity is recovering as the pandemic is gradually being overcome. It is likely to expand further over the next two years, albeit at a somewhat slower rate than in 2021.

Economic activity in the United States will receive a substantial boost from the American Rescue Plan, a comprehensive economic stimulus package.² The trade and co-

operation agreement reached with the EU³ shortly before the end of last year also gives reason to expect greater economic growth for the United Kingdom over the projection horizon than estimated in December.⁴ It had still been assumed back then that the negotiating partners would not reach an agreement by the end of 2020. China quickly brought the pandemic under control and by the middle of last year had already returned to its expansionary path expected before the coronavirus crisis hit. By contrast, economic activity in India is likely to have seen a sharp downturn in the current quarter due to the high numbers of infections. Although a rebound is expected by the end of the year, recurrent surges in infection counts and sluggish vaccination rollouts mean that a rather subdued recovery process is expected for many emerging market economies. The outlook for the global setting is still subject to a high level of uncertainty, especially regarding the future global progression of the pandemic.

For the global economy excluding the euro area, an increase of 6¼% is estimated this year, 4¼% next year and 3¾% in 2023. Following its significant decline last year, international trade (excluding the euro area) is initially likely to see a relatively strong uptick with rates of 10¾% this year and 5% in 2022. In 2023, global trade is expected to grow at 3¾%, representing a return to comovement with global activity.

¹ The projections made by the national central banks of the euro area countries were completed on 26 May 2021.

² See Deutsche Bundesbank (2021a).

³ See Deutsche Bundesbank (2021b).

⁴ This is true even despite the considerable economic downturn in the first quarter of 2021 owing to stricter COVID-19 containment measures.

Deutsche Bundesbank

Progress in combatting pandemic suggests strong euro area recovery

Tight restrictions in the wake of higher infection rates were considerably less of a drag on euro area economic activity in the last quarter of 2020 and the first quarter of 2021 than in the second quarter of last year. The decline in activity was even milder than expected last December. The restrictions mainly affected the services sector, whereas the ongoing recovery in global demand provided tailwinds for industry. The latter sector is expected to bolster economic activity in the euro area over the projection horizon, too. Now that the vaccination rollout is progressing and containment measures are gradually being eased, a strong recovery is expected for the second half of this year, which will continue in the next two years at a somewhat more moderate pace. Private consumption will probably play a particular role in this regard, as it is expected to recover quickly once households resume using a larger portion of their disposable income for consumer spending

as pandemic-related restrictions are lifted.⁵ After rising by 5% this year, economic activity in the euro area (excluding Germany) is projected to grow by 4½% in 2022 and by 2¼% in 2023, which means that a more dynamic recovery is expected than in the December projection.

Although German exporters' sales markets expanded less strongly on average over last year than global trade, this is primarily attributable to the drop in imports from the United Kingdom in the first quarter. Over the remainder of this year and in 2022, the sales markets are likely to recover more dynamically than global trade. Growth rates will be virtually identical in 2023.

Technical assumptions of the projection

Crude oil prices rose sharply over the first quarter in light of the expected rapid rebound in global demand. On average for 2021, prices will probably be around 50% higher than the level assumed in the December projection. Derived from forward quotations, however, a marked decline is assumed for the next two years. The prices of other commodities as measured in US dollars likewise went up steeply, and they are also expected to gradually decrease by the end of the projection horizon.

The ECB Governing Council shifted to a more accommodative monetary policy stance in December 2020 given the expected negative economic impact of a renewed increase in infection rates, increasing the envelope for the pandemic emergency purchase programme (PEPP) by €500

⁵ The extent to which savings accumulated owing to the pandemic were used to catch up on postponed purchases as well as additional or higher-quality services may differ across individual Member States. The speed at which each individual labour market rebounds from the consequences of the pandemic is one factor out of several in this regard.

billion to a total of €1,850 billion. It also extended the horizon for net purchases under the PEPP to at least March 2022. The objective of these purchases is to prevent a tightening of financing conditions depending on market conditions.⁶ Given the continued rise in liquidity, interest rates in the money market hovered at an all-time low in recent months. By contrast, the increasing hope that the pandemic will be overcome has led, since the beginning of the year, to a marked increase in yields on ten-year Federal bonds (Bunds) via the interest rate linkage with the United States. These instruments have also seen less demand as a safe haven asset. The improved economic outlook over the forecast horizon has put forward quotations on a stronger upward path than in the December outlook. Bank lending rates are likewise expected to rise gradually. All in all, however, financing conditions will continue to remain very supportive for enterprises and consumers.

Since the conclusion of the December projection, the euro-US dollar rate has been impacted by the pandemic, the progress in vaccination and the monetary and economic policy measures taken on both sides of the Atlantic. In the period underlying the exchange rate assumptions, the euro stood at US\$1.21 and was thus 2½% above the figure assumed in the December outlook. Compared with 42 currencies of major trading partners, the euro has appreciated only slightly.

Fiscal policy also highly expansionary in 2021

Fiscal policy measures will increase the general government deficit in 2021 by around 1% of GDP on the year, chiefly owing to additional structural expenditure. Going forward, pressure will be taken off the government budget, especially in 2022 as

Oil price

US\$ per barrel of Brent, quarterly averages

 Deutsche Bundesbank

coronavirus support measures are discontinued.

Coronavirus support measures in the narrower sense are set to weigh heavily on the deficit in 2021 at 3% of GDP, having expanded slightly compared with 2020. Most of these measures will expire in 2022. Guaranteed loans and capital injections that are only recorded in the debt level are also expected to decline from 2022. The imputations with regard to the coronavirus support measures are based on the assumptions made regarding the pandemic's trajectory, containment measures and economic growth. In this context, they are still well below the Federal budget's high spending authorisations, which comprise not only extensive additional across-the-board expenditure but also other major buffers such as business aid. Nevertheless, uncertainty surrounding their use remains extremely high.

Besides coronavirus support measures in the narrower sense, the outlook also takes into account other fiscal policy measures. Authorities at all levels of government have

⁶ See Deutsche Bundesbank (2021c).

Coronavirus response measures affecting the deficit*

As a percentage of GDP

Deutsche Bundesbank

been implementing tax cuts; for example, since the start of 2021, the majority of taxpayers have no longer had to pay the solidarity surcharge. Moreover, the income tax scale and allowances were adjusted, which largely offsets the additional revenue generated automatically by progressive tax rates. Tax amortisation has also been accelerated (including for fixed assets in information and communication technologies).⁷ By contrast, starting in 2021, additional revenue will be generated by the new certificates for CO₂ emissions from transport and building heating and by inflows from the EU's Next Generation EU (NGEU) programme. Transfers to Germany from NGEU of 0.2% of GDP each year have been earmarked for 2021 to 2023. These will generally be spent on existing programmes and in this respect will lower the government deficit.⁸ Additional government investment grants (not least for climate action and digitalisation), higher child benefits and the new basic

pension will put pressure on the expenditure side from 2021 in particular. With regard to social security funds, it is assumed that the Federal Government will again prevent higher contribution rates in 2022 as well by means of higher central government grants. As things currently stand, these are not envisaged for 2023, meaning that contribution rates will rise significantly, by 1½% overall through the end of the projection horizon. This increase will particularly affect additional contribution rates to health insurance institutions.

⁷ See Deutsche Bundesbank (2021d), p. 64 for more details on the tax measures.

⁸ On balance, Germany's public finances are impacted negatively by NGEU, as the expected payments to fund the NGEU as a whole significantly exceed the transfers to Germany. See Deutsche Bundesbank (2021d), p. 76.

pectations as reported by the ifo Institute have turned around sharply into positive territory during recent months. The twelve-month export expectations surveyed by the German Chamber of Industry and Commerce (DIHK) are also increasingly optimistic and almost returned to their long-term average.

... but are temporarily curbed by supply-side bottlenecks ...

Exports are thus generally likely to see continued strong growth. However, the sharply rising global demand for industrial goods in conjunction with supply-side disruptions contributed to the fact that, in recent times, enterprises have complained of increasing delivery times and growing shortages of certain commodities and intermediate goods. The bottlenecks for certain semiconductor components seem to be especially pronounced. This led to production being throttled in the German motor vehicle manufacturing industry.⁴ It should be assumed that these tensions will abate only gradually over the second and third quarters and will continue to dampen export growth for a time. However, in the projection, it is assumed that the supply-side bottlenecks will be resolved towards the end of the year. Enterprises should then be able to gradually work through their large numbers of orders, which will likely give exports an additional boost.

... and later lose momentum

The pace of export growth will wane again during the further course of the projection horizon. At that point in time, growth in global trade will be considerably more moderate, and German exporters will see a slight loss of market share in their sales markets. This holds especially true for trade with other euro area countries, as German enterprises will become less competitive in terms of prices due to the comparatively sharp rises in labour costs in Germany.

Initial dynamic growth in business investment as pandemic subsides

While business investment continued to rise in the final quarter of 2020 and first quarter of 2021, the rate of growth declined significantly in comparison with the extraordinarily large gains recorded in the third quarter of 2020. In

Supply-side bottlenecks

Sources: ifo Institute and IHS Markit. **1** Percentage of enterprises in the manufacturing sector reporting that their production was experiencing disruptions due to materials shortages. **2** Inverted scale; values lower than 50 are indicative of capacity constraints among suppliers and longer delivery times. Deutsche Bundesbank

this context, a role was certainly also played by the fact that investment in commercial vehicle fleets was dampened by sales channels being closed off due to pandemic containment measures as well as, potentially, difficulties regarding deliveries in the motor vehicle industry. In the second and third quarters of 2021, however, business investment should return to stronger growth. The pandemic will subside, which will reduce uncertainty surrounding sales prospects and allow for trade in motor vehicles to be reopened. In addition, industrial capacity utilisation recently rose above its long-term average for the first time in two years, meaning that capital expenditure on replacement and renovation is becoming increasingly necessary. In light of its need to catch up following the coronavirus crisis, as well as due to dynamic exports and a high utilisation rate, business investment should initially continue to see strong expansion going forward, too. Its rate of

⁴ See Deutsche Bundesbank (2021e), pp. 51 f.

growth will likely normalise towards the end of the projection horizon.

Private consumption is a strong driver of the economic recovery in the short term ...

The pattern of private consumption expenditure over time will be heavily influenced by the pandemic. In the final quarter of 2020 and the first quarter of 2021, private consumption fell sharply in light of the difficult situation regarding the pandemic and the stringent measures taken to contain it. The more severe limitations on opportunities for consumption led once again to a surge in the household saving rate. During the first wave of the pandemic in the spring of 2020, it could already be observed that pandemic-related reasons – such as fear of infection and, in particular, unavailable opportunities for consumption – were the primary reasons for spending cuts and involuntary saving. By contrast, traditional precautionary motives based on potential losses of income only played a subordinate role.⁵ Private consumption should quickly recover in the second and third quarters of 2021. Recently, there has been

a considerable decline in the number of coronavirus infections. Progress in the vaccination campaign should sustainably suppress the development of the pandemic over the summer, enabling containment measures to be relaxed further on a broad scale. Consequently, pandemic-related reasons for saving will swiftly lose significance.

Going forward, private consumption will also initially rise significantly faster than suggested by disposable household income, and the saving ratio will drop off rapidly. If, as assumed, all noteworthy pandemic-related restrictions have been unwound in the first few months of 2022 and decisions regarding saving and consumption are no longer directly influenced by the pandemic, the saving ratio will return to its pre-crisis level. It will then continue to fall, as it is assumed that around one-quarter of the involuntary savings that were accumulated during the pandemic will be used for additional consumption expenditure over the rest of the projection horizon (see the box on pp. 25 ff.). By the end of 2022, the saving ratio will have bottomed out and will increase again back towards its pre-crisis level. As a result, there will be a perceptible slowdown in the pace of growth in private consumption at the end of the projection horizon. In the long term, the saving ratio will likely reach a similar level to that recorded before the pandemic. However, this will first occur beyond the projection horizon. Only then will private consumption again grow more strongly in line with disposable income.

... and receives boost in the medium term due to partial spending of involuntary savings

The underlying trend in housing investment followed a steep upward trajectory in the last quarter of 2020 and the first quarter of 2021.⁶ This is likely to continue during the second and third quarters as the large number of new orders and building permits at the beginning of

Steep upward trajectory for housing investment

⁵ See Deutsche Bundesbank (2020b).

⁶ Housing investment declined slightly in the first quarter of 2021. Owing to the end of the VAT rate reduction at the turn of the year, some investment had been brought forward and thus did not occur in the first quarter. In addition, relatively unfavourable weather conditions hampered construction activity in the first two months.

Households' motives for saving during the pandemic and their implications for the projection

Over the course of the economic cycle, private consumption expenditure normally varies less strongly than macroeconomic activity. A different picture has emerged during the coronavirus crisis, however: against the backdrop of the ups and downs caused by the pandemic, private consumption actually even exhibited more pronounced swings than gross domestic product (GDP). It thus proved a key driver of the fluctuations in economic output. Looking at the determinants of private consumption reveals that this cannot be ascribed to changes in households' available income. During the pandemic-induced crisis, disposable incomes were shored up by extensive government aid. As these remained stable, the cutbacks to spending made by households occasioned an exceptional rise in the saving ratio, particularly in the first wave of infections in the second quarter of 2020 and again in the final quarter of 2020 and first quarter of 2021.

The results from the most recent wave of the Bundesbank Online Panel Households (BOP-HH) survey in March 2021 can be used to investigate the reasons behind the higher level of savings in the past 12 months.¹ Half of the participants reported that over the last 12 months they had had, on average, more money left over at the end of the month than they did before the pandemic. This response was given more frequently by participants with higher household incomes (and older respondents).

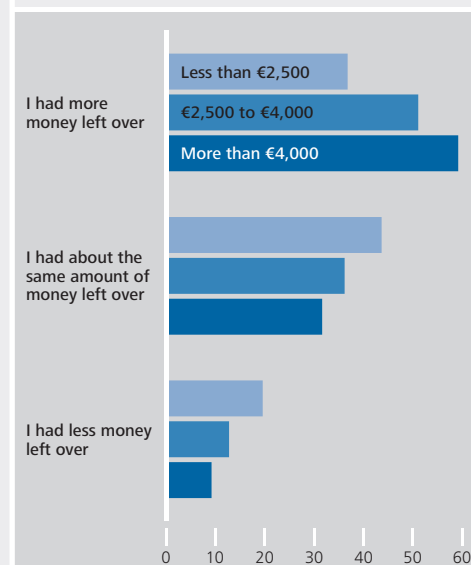

Almost all of these individuals (95%) cited restricted opportunities for consumption as a result of measures to contain the pandemic – mandatory store closures or travel restrictions, for instance – as a significant reason for their increased saving. In addition, just over one in five respondents restricted their expenditure on goods and services for fear of contracting coronavirus. By contrast, not even one out of every ten respondents stated worries about loss of income as a reason for saving more money. The gap between this classical precautionary motive and involuntary consumer restraint as a result of the pandemic widened

¹ See Deutsche Bundesbank (2021f). For results after the first wave of infections see Deutsche Bundesbank (2020b) or – for the euro area – Dossche and Zlatanos (2020).

² Nevertheless, more than one-third of participants from lower-income households and more than one-third of younger participants (ages 16 to 29) also had more money left over on average than before the pandemic.

considerably in comparison to the earlier survey round in August 2020.³

The findings from the BOP-HH thus suggest a tight link between pandemic activity and the saving ratio. Data from the national accounts also reveal a co-movement over time. This relationship carries implications for the projection: the saving ratio – and thus also private consumption – are likely to normalise swiftly once falling pandemic activity allows for previously unavailable consumption options to be opened up again. The projection assumes that pandemic-related restrictions will come to an end in the opening months of 2022. The saving ratio will then return to at least its pre-crisis level. Another highly significant factor is whether the savings built up involuntarily over the course of the pandemic remain parked in household wealth or are used for additional consumption. The latter scenario raises the question of what the scale and timeframe for this spending might be.⁴

In order to get closer to answering these questions, those BOP-HH participants who had additional savings owing to the pandemic were asked to imagine that the pandemic was over. They were then asked what they would like to use the extra savings accrued during the pandemic for. In total, 70% of respondents said they would spend at least some of their “coronavirus savings” on goods and services. The other usages are regarded as not directly con-

sumptive in nature; no more than one-third of individuals chose any one of these other usages.⁵ Since respondents from households with a higher income probably built up more savings during the crisis and those with a lower income probably fewer, the responses were first weighted by household income.⁶ In the case of multiple responses, the survey does not reveal what share of savings would be associated with each of the use options. The results were therefore additionally weighted by usage. Two extremes were considered.

- (1) The first case assumes that only those persons planning to use their extra savings exclusively to buy goods and services will spend their coronavirus savings. In terms of the share of savings being used for additional consumer spending, this therefore constitutes the lower bound scenario.
- (2) The second case assumes that the savings of each individual are distributed evenly across the selected uses. When savings are also invested in, for instance, real estate or shares, the proportion

³ At that point in time, around one-fifth of respondents were still citing classical precautionary motives, whereas 49% spent less because opportunities for consumption were closed off and 34% because they were afraid of catching the virus. In addition, in the August 2020 round, reasons for higher savings varied more widely by household income and age. See Deutsche Bundesbank (2020b).

⁴ The additional savings accumulated beyond what was anticipated in the December 2019 projection could amount to around €210 billion at the end of 2021.

⁵ The other possible answers (with the percentage of respondents who selected them given in brackets) were: invest in real estate (12%), invest in things other than real estate – e.g. shares, funds, current account – (30%), make gifts (9%), make donations to charitable causes (16%), pay off debts (13%), other (25%). Participants could choose more than one response.

⁶ Not only did households with higher incomes more frequently have money left over than before the pandemic than those with low incomes; they are also likely to have involuntarily saved larger sums. Weighting was by the mean for each income bracket relative to the mean income across all groups. For details of the income groups, see Deutsche Bundesbank (2021f), p. 25.

spent on goods and services is likely to be below average. Considered in terms of the share of coronavirus savings being expended again, this therefore constitutes the upper bound.

Overall, this places the share of additional savings built up during the pandemic which will be used for consumer spending in future at a lower bound of 25% and at an upper bound of 45%. The midpoint of this range, 35%, was set as the baseline for the projection. This would mean that the saving ratio would fall markedly short of its pre-crisis level for a time.

The results of the BOP-HH do not allow us to draw any inferences as to what time-frame this additional consumer spending would occur over, however. Higher-income households probably account for a large portion of the coronavirus savings; they could spread additional expenditure – on holidays, for example – over an extended period of time. In the light of this, it is assumed here that the saving ratio will drop below its pre-crisis level in the first quarter of 2022 and remain there for three years.⁷

Over a longer horizon, the saving ratio should then revert back to a higher figure, probably somewhere close to its pre-crisis level. Nearly 70% of all people who participated in the BOP-HH plan to use a similar share of their income for consumer spending as before the pandemic.⁸ This suggests that the pandemic will not have long-lasting effects on consumers' saving and consumption habits.

Given the importance for the projection of the assumptions made here, a sensitivity analysis was carried out to gauge macro-economic effects of applying different assumptions as regards the share of savings spent and the length of time over which this spending occurs. Working on the basis of the extremes described above, a first

Additional savings accumulated owing to pandemic*

* Calculated as the difference between households' cumulative savings during the pandemic and the December 2019 projection. From Q2 2021, Bundesbank projections. **1** 12.5% spent up to end of forecast horizon. **2** 23% spent up to end of forecast horizon.
 Deutsche Bundesbank

scenario assumed spending of just 25% of coronavirus savings (the lower bound) over a longer period of time spanning from 2022 to 2025. A second scenario posited 45% of savings accumulated during the pandemic (the upper bound) being expended on consumption within just two years.

The Bundesbank's macroeconomic model was used to simulate how these alternative trajectories for private consumption would affect GDP and the Harmonised Index of Consumer Prices (HICP). In line with the projection baseline, allowance was made for the likely prospect of a greater-than-usual portion of the consumer spending financed by the additional savings flowing into im-

⁷ This would see just under one-quarter of coronavirus savings being eroded over the projection horizon. This is in a similar magnitude to the figure applied for the December 2020 projection.

⁸ The remaining answers were almost evenly distributed: 18% stated that they would increase their consumer spending in the long term, while 13% wish to decrease it.

ports, since it is likely that more money will be spent on holidays abroad in particular. This would lessen the impact on GDP. Furthermore, enterprises were assumed to pass wage adjustments in response to the altered macroeconomic demand through to their prices without factoring in any productivity effects. This was done to take account of the specificities of the current setting, insofar as businesses are likely to strive to recoup at least part of the profits lost during the coronavirus crisis by charging higher prices.⁹ Additional price effects stemming from the tight goods market in 2022 and 2023 assumed in the baseline have not been included, however. Note also that the price reaction in the model generally occurs with a lag. As a result, the impact on the inflation rate in the two-year horizon considered here is comparatively modest only.

In the (first) scenario premised on the lower bound, private consumption climbs less

strongly in 2022. Real GDP would fall short of the baseline level by around 0.2% in both 2022 and 2023. By contrast, in the (second) scenario based on the upper bound, real GDP would exceed the baseline level by around 0.6% in 2022 and would still be 0.3% above it in the following year. The effects on prices are weaker, meanwhile. In the first scenario, HICP inflation would be barely any lower than the baseline. However, the stronger economic upswing in the second scenario leads, with a slight lag, to a higher rise in prices. The HICP rate would be one-tenth over the baseline in 2023. It is clear from the results yielded by these simulations that the projection was pitched cautiously: in the first scenario, the downward deviations from the baseline would be smaller than the upward deviations in the second scenario.

⁹ On the modelling of price equations in the macroeconomic model, see Deutsche Bundesbank (2019a).

the year indicates that demand for housing construction remains robust.⁷ Given the expected recovery in the labour market, demand will probably remain upbeat over the rest of the projection horizon, too, which will bolster housing investment. The persistently favourable interest rate environment will provide additional stimulus. In addition, some of the savings built up involuntarily during the pandemic will be used to invest in real estate, giving the latter a temporary boost.⁸ Towards the end of the projection horizon, housing investment should expand at a considerably more moderate pace owing, amongst other things, to the net decline in the number of new households being formed as a result of demographic changes.

Government investment will remain dynamic this year. More funding is earmarked, in particular, for transport infrastructure, childcare and schools. Growth will subsequently decelerate, not least because local government budgets are stretched and a number of invest-

ment programmes, such as the fund to promote municipal investment, are set to expire.

As a result of the coronavirus pandemic, real government consumption will increase sharply this year, too, driven by additional spending on vaccinations and testing. Government consumption will then drop significantly in 2022 as spending in response to the pandemic largely tails off. At the end of the projection period, the ratio of real government consumption to GDP will return to a similar level as before the coronavirus pandemic in 2019.

Coronavirus crisis driving government consumption; considerable additional spending again in 2021, which will tail off in the following years

Government investment will be stepped up again significantly in 2021 and increase moderately thereafter

⁷ Although incoming orders in housing construction showed a quarter-on-quarter decline, they were considerably higher than their pre-crisis level in the fourth quarter of 2019. However, shortages in the supply of building materials, which have recently increased sharply, could hold back housing construction.

⁸ Results from the March 2021 wave of the Bundesbank Online Panel Households (BOP-HH) survey suggest that this share is substantial, but still smaller in comparison to consumer spending (see the box on pp. 25 ff.).

Imports rise sharply

Imports will rise sharply during the projection period. Their growth will mainly be driven by the need for intermediate inputs for the increasing production of export goods and growing business investment, which also have a particularly high import content. Moreover, from next year, higher household consumption will provide a strong stimulus. Households are likely to spend some of the savings they have involuntarily built up during the pandemic on travelling abroad. This will boost Germany's services imports.

Current account surplus to fall to just over 6% of GDP

This year, Germany's current account surplus could clock in at around the same level as in 2020, when it amounted to 6.8% of nominal GDP. The trade surplus will decline somewhat more perceptibly. This is first and foremost a reflection of the substantial deterioration in the terms of trade in the wake of higher prices for crude oil and other commodities. The timing of the recovery of export demand and domestic demand will initially go some way towards offsetting this effect. Although exports have already been picking up again sharply for some time, imports are being held back a little longer by limited consumption opportunities. Over the remainder of the projection period, especially in 2022, domestic demand, and thus also imports, will rise briskly. The current account surplus will fall to just over 6% of GDP.

■ Labour market

Labour market very robust in Q4 2020/Q1 2021, but extensive use of short-time working hours

Despite the major resurgence of the pandemic and the containment measures subsequently taken in the fourth quarter of 2020 and the first quarter of 2021, the labour market proved extremely stable.⁹ To adapt to the reduced economic activity, working hours were shortened, especially through the use of short-time working arrangements. In the first quarter of 2021, on average, around three million employees subject to social security contributions once again received short-time working benefits to

compensate for economic difficulties. In addition, the loss of working hours per short-time worker was even higher at the beginning of this year than last spring. Employment and unemployment, on the other hand, remained virtually constant.¹⁰ Although the constraints stemming from the pandemic in the last quarter of 2020 and the first quarter of 2021 were larger than assumed in the December projection, all in all, the labour market responded more positively than expected at the time.

In the wake of the economic recovery, the labour market will already start to show substantial improvement in the second and third quar-

ters of the current year. At first, employees' working hours will go back up significantly as short-time working arrangements are unwound and, in some segments, working time accounts are replenished and overtime hours are worked. On average for 2021, the initially depressed level of employment will probably cause this year's level to fall slightly short of last year's. Mirroring employment, unemployment is likely to decline at a much brisker pace over the next few months. Labour market policy measures that were previously sidelined owing to the pandemic are expected to be resumed, particularly after the summer holidays. This will also reduce the number of people registered as unemployed. Labour productivity per hour worked is likely to recover rapidly.

Strong aggregate demand will probably further stimulate the labour market in the course of 2022. Strong demand for labour will see employment subject to social security contributions rise to well over its pre-crisis level. The number of hours worked will be expanded significantly again and will almost return to its level before the pandemic. Unemployment will continue to fall rapidly.

The labour supply will rise again markedly in 2022 following a slight dip in 2020 and 2021. During the crisis, a number of people withdrew from the labour force. As the recovery takes place, most of them are expected to return to the workforce as the structural conditions have not become significantly worse.¹¹ Immigration is likely to pick up again quickly from its tem-

Labour market will brighten in the second and third quarters of this year

Employment and hours worked to rebound strongly next year

Labour supply will also increase in 2022, labour force participation and immigration will recover

¹⁰ Reductions in self-employment and in exclusively low-paid part-time employment were balanced out by an increase in employment subject to social security contributions.

¹¹ Those who withdrew from the labour force were mainly people working exclusively in low-paid part-time jobs with no claim to unemployment benefits, such as students with part-time jobs, and people who took on care duties (primarily women). However, the supply of childcare and nursing care has not deteriorated structurally as a result of the crisis. Opportunities to earn additional income should arise again fairly quickly once most of the measures to contain the pandemic have been lifted. A number of older employees will probably have left the labour force permanently, however.

porary lull. Following net immigration of 209,000 people in 2020, immigration of 250,000 people per year is assumed over the projection horizon. Including a catching-up effect, the figure could temporarily hit 300,000 in 2022. Overall, the number of people in employment in 2022 is likely to go up again slightly more sharply before the effects of demographic change slow the pace from 2023 onwards.

Renewed increase in supply bottlenecks in the medium term; functioning of the labour market not permanently impaired by the pandemic

In the last year of the projection period, the supply bottlenecks that were already perceptible before the crisis are likely to have an impact on the labour market. In the course of 2023 already, employment growth will probably hit a wall as the aggregate labour supply ceases to expand. Instead, contrary to the long-term trend, hours worked per employee are expected to continue rising towards the end of the projection horizon, too, thus climbing above the level recorded before the start of the pandemic. The pandemic is not expected to notably impair the functioning of the labour market. The large-scale deployment of short-time working schemes prevented extensive layoffs and the loss of firm-specific human capital during the crisis, thus stopping unemployment from becoming entrenched. This helped employees first and foremost. However, people seeking to change careers or sectors, those just starting their careers and immigrants are at greater risk. Assistance grants and professional development measures are particularly helpful for these groups. These adjustments will still take quite some time. Despite high demand for labour, unemployment could therefore still be slightly up on its pre-crisis level at the end of the projection horizon.

■ Labour costs and prices

The wage increases recently agreed by wage bargainers have been low. Against the backdrop of the coronavirus crisis, one of the key aims was to preserve jobs. Another goal was to partner structural change in major industries

Negotiated pay rates, actual earnings and compensation of employees

Year-on-year percentage change, monthly basis

Source: Federal Statistical Office and Bundesbank projections.
¹ According to the Bundesbank's negotiated wage index.
 Deutsche Bundesbank

through the temporary use of collectively agreed reductions in working hours. The wage increases resulting from the current negotiations and from those scheduled for later this year are expected to be low on the whole.¹² Over the next two years, however, higher wage settlements will be reached owing to the strong economic upturn, which will lead to high capacity utilisation and a marked decline in unemployment. However, the duration of the previously concluded agreements containing lower wage growth means that this will not be reflected in noticeably larger increases in negotiated wages until the last year of the projection period.¹³ Nonetheless, at the same time, negotiated rates of pay will not achieve the same strong growth as before the crisis.

Rise in negotiated wages initially sluggish owing to the crisis, but significantly stronger again towards end of projection horizon

The adjustments in the labour market are having a substantially larger impact on actual earnings than on negotiated pay rates. Last year,

¹² In major sectors, only a few pay negotiations are scheduled for the second half of 2021. Even so, the high projected inflation rates in the fourth quarter could contribute to higher wage settlements than assumed here (see the section about the risks on p. 37).

¹³ All past pay agreements included in the Bundesbank's negotiated pay rate statistics (around 500 collective wage agreements and provisions governing civil servant pay) are factored into the projections of negotiated wage increases. They are extrapolated beyond their contractual term, taking into account the overall economic situation and industry-specific features.

Actual earnings to rebound sharply from as early as 2021 as use of short-time working arrangements dwindles and hours worked increase

actual earnings stagnated, chiefly on account of the major increase in the use of short-time working arrangements. However, they are set to recover significantly more rapidly in 2021. As short-time work is successively scaled back and hours worked therefore gradually increase, actual earnings will pick up quickly. Wage drift will thus return to clearly positive territory this year already. Over the next two years, performance-related bonus payments and paid overtime resulting from the upbeat economic situation will increasingly add to positive wage drift. In 2023, actual earnings will also experience strong growth off the back of rising staff shortages. Mounting social security contribution rates for employers – especially for the statutory health insurance scheme – will then raise labour costs (measured by compensation per employee) once again.

Unit labour costs to normalise; domestic inflation fairly perceptible

After rising sharply last year in the wake of the crisis, unit labour costs will probably recede slightly this year and next. This is a reflection of a lagged macroeconomic adjustment process. During the crisis, both employment and wages remained relatively stable – not least thanks to the use of labour market policy instruments. Labour productivity per person suffered considerably from the strongly depressed level of economic activity. As a result, unit labour costs soared. This was offset by a sharp drop in ag-

gregate profit margins. During the subsequent recovery, economic activity will already start to expand strongly this year, while wage growth will remain subdued for a little longer. This will allow unit labour costs to return to normal. At the same time, profit margins will show an almost identical recovery this year and next. In 2023 unit labour costs will then go back up markedly and enterprises could expand their profit margins again slightly in the light of the favourable macroeconomic environment. Because fluctuations in unit labour costs are largely cushioned by profit margins over the entire projection horizon, domestic inflation as measured by the GDP deflator will vary relatively little. However, it will be fairly perceptible. In 2023, the GDP deflator could go up by almost 2%.

In the first quarter of 2021, consumer price inflation (as measured by the HICP) surged from -0.6% in the previous quarter to +1.7%. Among the factors that contributed to this were the end of the VAT rate reduction and the new CO₂ emission certificates. The magnitude of these effects was roughly as expected in the December projection.¹⁴ What came as a surprise, by contrast, was a statistical one-off effect which resulted from the annual adjustment to the weighting of the individual HICP components and which had a stronger impact than usual owing to the coronavirus crisis.¹⁵ This one-off effect raised headline inflation by just over 0.3 percentage point in the first quarter of 2021. Besides this, prices for crude oil and

Surprisingly strong increase in inflation rate at start of 2021 owing to one-off effects

¹⁴ For more information about the price effects stemming from the temporary reduction in VAT rates, see Deutsche Bundesbank (2021c, 2020g). The impact of the Climate Package on inflation and economic growth has already been included in the forecast since December 2019 (for more information on this, see Deutsche Bundesbank (2019b)). After the previous forecast was published, however, two things happened. First, the carbon price was raised significantly. Second, supported by additional revenue stemming from the higher carbon price, a cap was placed on the levy imposed by the German Renewable Energy Act (Erneuerbare-Energien-Gesetz – EEG), which is an important component of energy prices, for 2021 and 2022, with the prospect of additional relief for 2023. Taking these measures together, the inflation rate could rise by 0.3 percentage point in 2021.

¹⁵ See Deutsche Bundesbank (2021h).

– owing to the unusually cool weather in the second quarter – also those for agricultural products went up unexpectedly. This meant that in May, too, the inflation rate exceeded the expectations of the December projection by just over one-half percentage point.¹⁶ But core inflation (excluding energy and food), which is expected to stand at 1.6%, was also up by a quarter of a percentage point on the previous projection. This is primarily attributable to a stronger than anticipated rise in prices for industrial goods excluding energy.

Inflation rates temporarily very high in second half of 2021

In the second half of the year, the annual inflation rate will probably rise steeply. This is primarily linked to the price-driving base effect of the temporary reduction in the VAT rates the year before. Although the statistical one-off effect mentioned above will drag down inflation from July to October, it will then have an amplifying effect in November.¹⁷ Overall, as things stand, at the end of the year, inflation rates could briefly hit the 4% mark.

Relatively high inflation rate also in 2021 as a whole, but core inflation excluding one-off effects still subdued

In 2021, inflation is likely to stand at 2.6% on an annual average. Energy, in particular, will become more expensive, as will food. The rate excluding energy and food will climb from 0.7% to 1.6% in 2021 owing to the change in VAT rates. Factoring out tax effects, the rate would probably stand at just over 1%, as was the case last year, which is significantly lower than in 2019 (+1.4%). A key factor is the delayed, price-dampening impact of the reduced aggregate demand. It will not be offset by higher prices for commodities and increased transport costs, which are primarily reflected in industrial goods excluding energy.

Core inflation elevated in 2022 and 2023 in the wake of strong upturn

In 2022, core inflation could be almost as high as in 2021, despite the absence of the one-off effects. One major reason for this is the above-average degree of overall capacity utilisation. In addition, there are likely to be lagged adjustments to the higher commodity prices. In 2023, wage growth and capacity utilisation will increase somewhat. Against this backdrop, the core rate may climb further.

Impact of selected one-off effects on the inflation rate in 2021

Deutsche Bundesbank

Headline inflation rate to align with core rate by 2023 as one-off effects wear off

fects largely wear off.¹⁸ However, energy and food prices will probably still see above-average growth as consumer prices are responding to this year's price increase for crude oil and agricultural products with a (partial) lag. As a result, the headline inflation rate will remain significantly above the core rate. This gap is not set to close until 2023, when both rates will stand at 1.7% according to the projection. Although food prices will rise by more than average due to higher wage increases, energy prices will see below-average growth. Here, the dampening effect of the assumed decline in crude oil prices will prevail over the continued rise in CO₂ prices and rising forward rates for electricity.

Public finances

Public finances have continued to provide significant support to the economy in 2021. On the back of this, the general government

budget deficit will rise to around 5½% of GDP (2020: 4½% of GDP). This increase is primarily attributable to measures unrelated to the coronavirus pandemic. For instance, the partial abolition of the solidarity surcharge and the increased child benefits are boosting households' disposable income. Furthermore, government grants are encouraging private investment in climate action. The fiscal stabilisation brought about by temporary one-off coronavirus-related measures will increase slightly. However, the fact that the cyclical impact on the government budget is set to be somewhat less negative than in 2020 will have a deficit-reducing effect.¹⁹ Public finances will respond to the economic rebound with a lag over the course of the year, chiefly due to wage and labour market developments, which are particularly relevant for the government budget.

Public finances continue to give significant economic support in 2021

According to this projection, the deficit is then set to fall significantly to 1½ of GDP in the coming year. This is because coronavirus-related measures will largely have been unwound as the crisis has broadly been overcome. In addition, the economic upswing will provide substantial relief for government finances, and the cyclical impact on the government budget will be slightly positive. In 2023, the deficit will fall a little further. This is due, in particular, to steeply increasing contribution rates for the statutory health insurance scheme.

Subsequent significant decline in government deficit, particularly in 2022

Compared with the pre-crisis year of 2019, the structural situation of government finances will be less favourable at the end of the projection horizon: the structural surplus of ½% of GDP in 2019 will turn into a structural deficit (some-

Structural government deficit towards end of projection horizon

¹⁸ The relief provided by the EEG levy will partially offset the rise in CO₂ prices in 2022 and 2023.

¹⁹ In times of crisis it is especially difficult to gauge cyclical influences on the government budget. This holds, not least, for profit-related taxes; they usually respond to economic developments with, in some cases, a time lag. However, as things currently stand, the models used to estimate the cyclical impact on the government budget are likely to respond too slowly as, for instance, enterprises' advance payments already decreased sharply in 2020.

where in the region of 1½% of GDP).²⁰ A key factor here is that pension and healthcare expenditure as well as investment grants are rising steeply. Around one-third of the structural deficit is attributable to social security funds, primarily the pension insurance scheme. The deficit also anticipated for the next few years in this area will then have to be offset by higher contribution rates, according to the current rules, because the reserves will largely have been exhausted.

Debt ratio to continue rising initially in 2021, but then to decline significantly

The debt ratio is set to rise to over 70% this year (2020: 69.7%). This is attributable, first and foremost, to the high central, state and local government deficits. In addition, in light of the generous draft budget, it is assumed that central government's cash reserves will increase further still. This rise will be reined in by nominal GDP growth in the denominator and the continued deleveraging of state-owned bad banks' portfolios. The debt ratio will subsequently decline to around 65% by 2023. Although deficits are anticipated for the next few years, these will then be significantly lower. Furthermore, coronavirus-related one-off effects (assistance loans, equity injections and higher cash reserves) will be scaled back to some degree, and the portfolios of state-owned bad banks will continue to shrink. Lastly, the nominal GDP growth in the denominator will significantly depress the debt ratio.

■ Risk assessment

Reduced pandemic-related uncertainty

The German economic growth and consumer price inflation outlook presented here is subject to various uncertainties. The future trajectory of the pandemic and its macroeconomic consequences remain difficult to assess. However, chiefly on account of the ongoing vaccination campaign, uncertainty in this area has already decreased substantially. In contrast to the two macroeconomic projections from June and December 2020, therefore, no alternative scenarios with different assumptions regarding the

development of the pandemic were prepared for Germany.²¹

However, uncertainties surrounding the indirect repercussions of the pandemic and the imminent recovery phase are now coming to the fore. No historical benchmark exists for this situation, either, and surprises are to be expected. The effect of the reopening of many economic sectors on the price outlook is particularly uncertain. All in all, the risks appear to be more or less balanced from today's perspective, while the risks to the inflation outlook are tilted to the upside.

All in all, risks to economic growth more or less balanced but risks to outlook for inflation rate tilted to the upside

With regard to the direct impact of the pandemic, risks materialising in the short term can be identified in both directions. Depending, first and foremost, on how the vaccinations progress, non-medical containment measures could either be withdrawn earlier and on a

Uncertainties in the short term regarding pace of easing restrictions; risk of medium-term setback due to virus mutations

²⁰ Cyclical factors and temporary one-off effects (broadly in line with coronavirus-related measures in the period under review) have been stripped out of the structural variables.

²¹ In the Eurosystem's June projection, scenarios for the euro area as a whole based on different assumptions regarding the pandemic and the impact of the coronavirus crisis on potential output in the long term were calculated (see European Central Bank (2021)). The macroeconomic implications of these various scenarios for Germany will probably, on the whole, be similar to those for the euro area in its entirety.

broader basis, or remain in place for longer and on a larger scale. Significant setbacks could occur over the entire projection horizon if the virus mutates in a way that substantially reduces the efficacy of the vaccine. The longer it takes to overcome the pandemic on a global scale, the greater this risk will be. Quite aside from weaker foreign demand, immediate protective measures could also then impair the German economy once again.

In terms of recovery in the sectors affected by the restrictions, the speed at which currently inaccessible consumption opportunities open up once more is not the only relevant factor. The degree to which consumers use these again also plays an important role. Pent-up demand could be released sooner and more strongly overall in the event that households spend the additional savings they have accumulated during the pandemic more quickly or on a larger scale, for instance. The model-based simulation results suggest that the projection has been pitched relatively cautiously in this regard. Should this be the case, economic activity, in the first instance, but also inflation may be higher (see the box on pp. 27 f.). However, note that there is significant sectoral variation in terms of postponed consumption and the competition situation. Specifically in the sectors that have been subject to lengthy restrictions, short-term peaks in demand and supply shortages could trigger additional price surges. This would be especially true if the crisis resulted in more insolvencies than expected, dampening supply in the short term and increasing market concentration in the medium term.

Upside risks to economic activity and inflation if pent-up demand sees stronger surge

Tensions resulting from renewed demand after the crisis are currently making waves in global industry. In Germany, too, increasing delivery times and rising prices for important commodities and intermediate goods are hindering recovery and generating cost pressure at the upstream input stages, impacting on consumer prices. Should global supply bottlenecks dissipate more quickly than expected, economic

Uncertainties about global supply bottlenecks in commodities and intermediate goods in the industrial sector

output could return to a higher level sooner. However, if these shortages are prolonged, recovery may be more subdued and consumer prices could simultaneously climb more steeply.

Upside risks if economy overshoots expectations in key partner countries, but also increased risks from asymmetrical recovery of global economy

Many economies worldwide are currently in a similar situation to that of Germany. Should the economic recovery in key partner countries overshoot expectations, the German economy would generally profit from this due to its strong focus on exports. At the same time, though, some risks to the world economy would increase – the global recovery from the coronavirus crisis is already occurring at a highly uneven pace. While some economies such as those of the United States, the United Kingdom and China largely have the pandemic under control, this is far from the case in many emerging market economies. The resulting asymmetries are being exacerbated significantly further still by, in some cases, vast differences in the degree of monetary and fiscal policy expansion. They could, for example, create turmoil with negative real economic feedback loops on the financial markets. Taken in isolation, therefore, the asymmetries entail downside risks to the outlook for both the global and the German economies. Given a more dynamic pace of recovery in the leading economic areas, these risks could intensify.

Higher inflation rates if crude oil price does not decline as assumed

The sharp upturn in global demand also meant that the crude oil price, which had slumped at the start of the pandemic, made a strong recovery. The projection is based on the assumption that the crude oil price will fall noticeably from its elevated level again over the projection horizon in line with forward prices. This places a significant dampener on the projected price increase and contrasts somewhat with the ex-

pected continuation of the global economic recovery. If oil prices remain at their current level or rise further – in the wake of a potentially even stronger expansion of the global economy, for example – the inflation rate will be higher.

Greater risks to the outlook for more steeply increasing energy prices are likely to result from climate action policy. Following a fundamental ruling from the Federal Constitutional Court, the Federal Government recently substantially increased Germany's climate targets. However, the necessary measures have not yet been specified. The existing fixed price for CO₂ emission rights could conceivably be significantly increased in the near future, for example. These or similar measures would increase energy prices further.²² The implications for economic growth during the projection horizon largely depend on the extent to which climate policy is coordinated with international partners, and how additional government receipts are put to use.

The exceptionally high inflation rates by German standards projected for the second half of 2021 could ultimately shift economic agents' inflation perceptions and expectations. As a result, wage and price-setting behaviour could change and exert further inflationary pressure. This would especially be the case if headline price inflation in the near future were to be even higher than estimated here in the light of the existing upside risks.

Ambitious climate targets likely to cause steeper rise in energy prices

Inflation expectations could rise and exert further inflationary pressure

²² For model simulations of the macroeconomic effects of the rollout of carbon pricing, see Deutsche Bundesbank (2019b). The calculations used were based on draft legislation. One of the measures taken as the legislative process progressed was that CO₂ prices were hiked.

Government finances: Central bank bond purchases increase sensitivity to interest rate changes

In the euro area, the current very low interest rate level is creating favourable funding conditions across all maturities. This is probably one of the reasons why the euro area countries have increasingly taken on longer-term debt. In doing so, they have better protected themselves against the impact of short-term interest rate rises. At the same time, however, it is important to bear in mind that the central banks' extensive bond purchases are ultimately increasing the interest rate sensitivity of government finances.

On the one hand, central banks' bond holdings generate interest income during the holding period; on the other, bond purchases lead to deposits from commercial banks (subject to a short-term interest rate) with the central bank. If the interest on assets (bond holdings) is higher than that on liabilities (deposits), net interest income is positive (and negative if the reverse is true). This initially increases the central bank's profits and, through its profit distribution, government revenue too. If the deposit rate rises, net interest income falls in the short term, thus also reducing the central bank's potential profit distribution. An interest rate reversal may also lead to balance sheet losses.

The specific payments that central banks make to their national governments depend on various factors, including balance sheet risk provisioning. For example, provisions for interest rate risk or default risk change the timing of such payments. As a case in point, some central banks (including the Bundesbank) distributed little or no profits for the year 2020, instead topping up their provisions as a precautionary measure.

In view of the policy decisions applicable at present, the Eurosystem central banks are likely to expand their balance sheets and significantly increase their already large government bond holdings. Next year, the public bond holdings of member countries and supranational entities in the Eurosystem could thus come close to 40% of gross domestic product (GDP). This is likely to be accompanied by a further rise in deposits from commercial banks.

In a sense, the euro area countries are paying the medium to long-term market rates on their national central bank's holdings of their bonds to themselves; consequently, the effective funding costs for this component of government debt ultimately depend on the Eurosystem's short-term interest rate. The more unfavourable a member country's current funding conditions on the capital market, the more financially advantageous this is. At the same time, it makes the government budgets of all euro area countries more dependent on changes in the short-term interest rates.

Interest developments affect government budgets

Interest burden falling in euro area despite significant debt increase

Through interest expenditure, government debt places an ongoing burden on government budgets. The debt ratio in the euro area has seen a sharp rise, particularly in the wake of the financial and economic crisis of 2008-09 and in the current coronavirus crisis. By contrast, interest expenditure has continued to decline. This is mainly because euro area countries have been able to access very cheap funding for some years now – in recent years, sometimes even at negative interest rates. This has also caused the average interest rate on government debt to fall to record lows (see the chart below).

Interest expenditure reacts at different speeds to change in capital market rates

The impact of the current funding conditions on interest expenditure depends on the level of new borrowing as well as on the volume and structure of the debt securities that need to be refinanced. The residual maturity structure thus

plays a key role in the interest sensitivity of public budgets. Short-term debt is often rolled over, i.e. replaced with new debt. The shorter the maturity of outstanding fixed rate liabilities, the faster interest expenditure responds to changes in funding conditions. It also reacts quickly if liabilities have longer maturities but variable interest rates.¹ In addition, longer-term fixed rate liabilities can, for example, be tied to a variable interest rate via derivatives (such as interest rate swaps), or vice versa.

Through their debt management, governments can thus influence how strongly interest rate changes affect their budgets in the short term. For example, if a government borrower wants to secure a current low interest rate for the long term, it may make sense for it to issue more debt securities with a longer interest fixation period. A longer maturity is usually initially associated with higher average interest rates. On the other hand, there is then a corresponding lag before rising – or falling – interest rates are reflected in interest expenditure. This means that governments have more time to respond to a general or country-specific interest rate increase. Government finances with lower interest sensitivity can also help to reduce the pressure on monetary policy to keep government funding costs low. As government debt is currently very high in some countries and funding conditions are very favourable, it is understandable that many governments are further lengthening the maturity structure of their debt. Since the launch of monetary union, the average residual maturities of euro area government bonds had already risen noticeably (see the chart on p. 41 for information on the five largest Member States).

Government debt management influences interest expenditure

General government fiscal ratios for the euro area

Source: Eurostat. **1** Gross government debt as a percentage of gross domestic product. **2** Ratio of interest expenditure to the average debt level for the year. **3** Interest expenditure as a percentage of gross domestic product.

¹ Here, the interest rate is usually tied to a largely risk-free short-term interest rate, such as the EURIBOR. This means that the government is, at least, protected from a change in the risk premium. This premium only becomes relevant again if the debt security needs to be refinanced at maturity.

Interest burden influenced by central banks' bond purchase programmes

De facto shortening of interest rate fixation through central banks' bond purchases

In addition to the debt structure, central banks' bond purchase programmes are also influencing the government debt burden.² In effect, the impact of these programmes is similar to a reduction in the interest rate fixation period for government debt. The main factor at play here is the balance sheet connection between the central bank and government finances. Government bond purchases influence central banks' profits and hence their payments to the government. This balance sheet connection thus does not change the government's interest expenditure but it does change its revenue (from the central bank's profit distribution and, in some cases, also tax payments from the central bank).

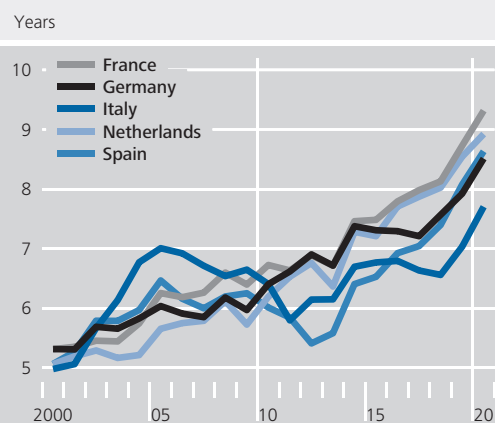

In 2022, Eurosystem public bond holdings could come close to 40% of GDP

The basic mechanisms at work are illustrated below using the example of the Eurosystem.³ The European Central Bank and the national central banks have been purchasing government bonds on a large scale, particularly via the public sector purchase programme (PSPP) and the pandemic emergency purchase programme (PEPP).⁴ Further purchases are envisaged for the coming months. Next year, the public bond holdings of member countries and supranational entities in the Eurosystem could thus come close to 40% of GDP.⁵ The vast majority are accounted for by the national central banks; their PSPP and PEPP holdings primarily comprise the debt securities of their own countries, and they alone bear the associated default risk.⁶ The resulting interest income effectively accrues to the respective national central bank.⁷

Balance sheet structure of central banks: purchases of long-dated government bonds on the assets side ...

The bond purchases⁸ are affecting central banks' balance sheet structure and profits. They have a broad maturity range, with the average residual maturity of the PSPP and PEPP holdings across the entire Eurosystem coming to around seven and a half years at the end of 2020. The government bond portfolios generate interest income, which accrues either until

Average residual maturities of government bonds*

Source: Bloomberg. * Year-end figures, central government bonds.

Deutsche Bundesbank

² Central bank government bond purchases have a variety of economic effects on the interest rate level for government bonds. In this article, however, the focus is limited to the balance sheet connection between the government and the national central bank and the associated effects on government finances.

³ See Deutsche Bundesbank (2017).

⁴ See European Central Bank (2015a, 2020a). Furthermore, the Eurosystem is still holding government bonds acquired under the securities markets programme (SMP), which ran from 2010 to 2012. Various Eurosystem national central banks are also holding government bonds for non-monetary policy purposes. See also Deutsche Bundesbank (2016).

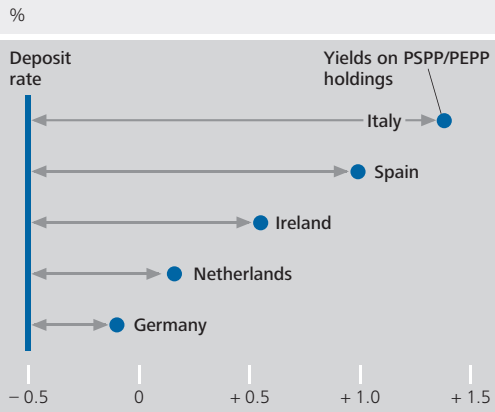

⁵ PSPP purchases of euro area government bonds are guided by the ECB capital key on a stock basis. However, the capital key is not only based on a member country's GDP share (currently the average of the years from 2011 to 2015) but also on its population size (as at 2016). As part of the expansion of purchases introduced by the PEPP in 2020, a more flexible purchase approach guided by the capital key is temporarily being applied. By the end of the PEPP purchase horizon, temporary deviations are to be evened out again, however.

⁶ See European Central Bank (2015b). As agreed, this applies to 80% of the PSPP/PEPP volume. Around 10% is held by national central banks in the form of supranational bonds, whose income contributes to the Eurosystem's profit and is distributed according to the capital key; the same applies to the ECB's direct purchases, which make up approximately 10% of the PSPP/PEPP volume, and to the SMP holdings.

⁷ For the purposes of the Eurosystem's general profit distribution based on the capital key, the main refinancing rate – not the effective interest rate – is applied to government bond holdings. See European Central Bank (2016), last amended by European Central Bank (2020c).

⁸ If, instead of national government bonds, the central bank purchases other balance sheet-lengthening assets at its own risk (such as corporate bonds (with risk sharing)), governments become more tightly bound to the short-term interest rate. With risk sharing, however, interest income from purchases is distributed differently within the Eurosystem.

Yields on PSPP/PEPP holdings in 2020 compared to the Eurosystem's standard deposit rate

Sources: Annual reports of the respective central banks.
 Deutsche Bundesbank

the bonds are sold or over their entire residual maturity. The effective interest rate results from the coupon and the difference between the purchase price and the repayment amount (the chart above provides information on central banks for which the relevant data have been published).⁹

... versus short-term deposits on the liabilities side

Above all, the bond purchases increase excess liquidity. This means that, in effect, the balances that banks hold on their deposit accounts with national central banks exceed their respective minimum reserve requirement (see the chart below for developments in the Euro-

system).¹⁰ The interest rate on this excess liquidity currently corresponds to the Eurosystem's deposit rate.¹¹ The deposit rate was positive until 2012 and was mostly 1 percentage point below the refinancing rate. In mid-2012, the deposit rate was lowered to 0%, and it has stood at -0.5% since September 2019.

The impact of expanding central bank balance sheets¹² is twofold. On the one hand, central banks' interest income goes up. This income is thus largely tied to yields on medium to longer-term government bonds (at the time of purchase), and is even negative in some Member States. On the other hand, it generates interest expenditure, which is based on the short-term deposit rate and is therefore currently negative for all central banks across the board. This type of maturity transformation generally drives up central bank profits at first because the deposit rate is usually lower than the interest rate on medium to longer-term government bonds.

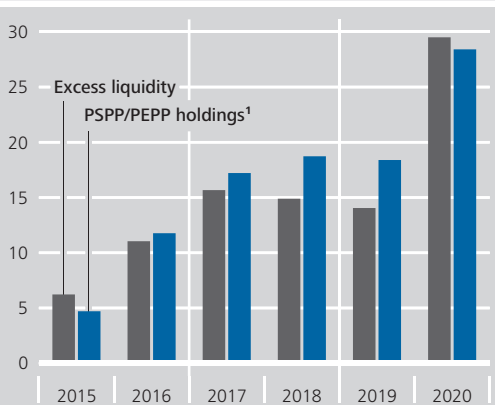

Maturity transformation has driven up central bank profits

If interest rates (and with them, the deposit rate) rise, central banks' net interest income falls as a direct result: while interest income on the holdings of longer-term bonds initially remains more or less stable, interest expenditure rises directly with the deposit rate. In such a case, central bank profits thus respond quickly to changes in

Rising interest rates then weigh on central bank balance sheets ...

PSPP/PEPP holdings and excess liquidity in the Eurosystem

As a percentage of GDP

Source: ECB. ¹ Cumulative net purchases.
 Deutsche Bundesbank

⁹ For the profit and loss account, amounts resulting from a premium/discount are allocated over the term of the bond on an accruals basis.

¹⁰ The bond purchases could, in principle, also have other balance sheet effects. For example, if banks still funded themselves to a large extent via regular Eurosystem refinancing operations at the main refinancing rate of 0%, their volume could be expected to initially decline – before the banks end up holding funds on their central bank account and paying an interest spread. However, the volume of regular refinancing operations underwent a significant decline quite some time ago. At present, the government bond purchases are effectively increasing excess liquidity on a broadly similar scale.

¹¹ As long as it exceeds six times the minimum reserve requirement, which is relatively low. Unlike with income from government bonds, interest expenditure on (currently, interest income from) deposits with the national central banks is distributed within the Eurosystem according to the ECB's capital key – regardless of which central bank holds the deposits in the form of excess liquidity.

¹² Balance sheets are expanded when a transaction affects both the assets and liabilities side of the balance sheet to the same extent, increasing the balance sheet total overall.

interest rates. An interest rate reversal may then even lead to negative net interest income. Both the extent of the interest rate rise and the volume of bond holdings have a role to play here. For a transitional period, the reduced current income lasts for as long as central banks still have legacy holdings of bonds bearing relatively low interest. Higher income may be on the cards going forward if maturing bonds are to be refinanced at higher rates of interest.¹³

... and profit transfers to government

The government participates in the risks and earnings of a central bank's activities through profit transfer. Euro area central banks' distributions are largely destined for their own government.¹⁴ The funds distributed are usually central bank profits, but in some cases there are special circumstances.¹⁵ In some Member States (for instance France and Italy), central bank profits are taxed. In this case, they are passed on to the government partly as tax payments and partly as profit transfers. There may also be time lags in transferring central bank profits. For instance, risk provisions may be built up or released, thus lowering or raising the annual profit.¹⁶ Any losses that may arise can be offset against future profits or capital injections from the government.¹⁷ Ultimately, fluctuations in central bank income are passed through to government finances.

Transforming risky long-term interest rates into risk-free short-term interest rates

The link between government and central bank balance sheets means that the medium to long-term fixed interest rates on government bonds held by central banks are, in effect, transformed into a variable interest rate. If, for the sake of simplicity, the government and central bank are considered as one entity, the government is effectively no longer receiving funding – in the amount of the fixed rate bonds held by the central bank – from the yields on its bonds. Instead, it is ultimately charged the deposit rate for this portfolio.¹⁸ If the financial market applies a risk premium for government bonds, the government, in effect, pays itself the premium. Governments with poorer market valuations then do not receive these risk premia in the amount of their central bank's

government bond purchases. These effects also apply if the central bank purchases variable rate or very short-term government bonds and is therefore not bound by the lower fixed interest rates described above.

■ Relief varies

As a concrete example, yields on German government bonds reported on the Bundesbank's 2020 balance sheet were slightly negative (average of -0.1%).¹⁹ Given the difference to the deposit rate of -0.5%, the PSPP and PEPP government bond holdings can be estimated to have yielded a profit contribution of roughly €2 billion in 2020. The extremely low, almost risk-free medium to long-term yields have effectively been transformed into interest at an even lower, risk-free central bank rate.

Short-term arithmetical rise in Bundesbank profit due to bond holdings despite negative yields ...

However, a whole host of other income and expenditure is associated with the distributable balance sheet profit.²⁰ Given the potential

... but, in return, weighed down by risk provisioning

¹³ If bonds are sold before they mature, central banks sustain these losses in income from rising interest rates at an earlier stage because the bonds are recognised at amortised cost.

¹⁴ Some central banks (e.g. those in Italy and Belgium) also have private shareholders that participate in profits, too. However, their share of the distributions is much smaller than that of the government.

¹⁵ Central bank profits are also dependent on a number of other factors, including institutional and legal requirements as well as accounting standards. These requirements also have a bearing on decisions relating to setting up provisions, and ultimately determine the discretionary scope for central bank management.

¹⁶ See Deutsche Bundesbank (2021), pp. 65 f.

¹⁷ See European Central Bank (2020b), pp. 28 f.

¹⁸ The "transformation" takes place at the time of purchase and at the market conditions that apply to the bonds purchased. This does not include provisions due to potential interest rate rises or default risk.

¹⁹ Interest income in relation to average holdings of government bonds under the PSPP and PEPP (mean of holdings at the start and end of 2020). Yields on new purchases were, in some cases, below -0.5%.

²⁰ In 2020, the profit was hit particularly hard by negative interest income from refinancing operations with banks at favourable interest rates (targeted longer-term refinancing operations, or TLTROs). These operations enable banks, under certain conditions, to obtain liquidity via longer-term refinancing operations that bear even more favourable interest rates than the deposit rate (even further into negative figures). See Deutsche Bundesbank (2021), pp. 54 ff. The same is also true for other Eurosystem central banks.

Profits of euro area national central banks for the 2020 financial year

As a percentage of GDP

Deutsche Bundesbank

losses due, inter alia, to changes in interest rates, the provisions were topped up by €2.4 billion using model-based calculations. On balance, the Bundesbank did not distribute any profit in 2020 and announced a further increase in the risk provisions for the current year.²¹

Other central banks with sharper rise in profits from higher-yielding government bonds

In other Member States, the profit contribution from government bond purchases is considerably higher in some cases. The market called and still calls for risk premia in the form of interest surcharges. At the end of the day, in such cases, it is the national central bank that takes on default risk and receives the risk premia.²² Ultimately, there could be several reasons for differences in the amounts of profit that national central banks transfer to the government (profit distribution and payments of profit-related taxes). However, the varying rates of interest paid on government bond purchases play a major role. The highest profit distribu-

tions last year amounted to almost ½% of GDP (Italy and Greece, see the adjacent table).²³

National central banks' net income from government bond purchases could grow further going forward. Holdings increased last year. Moreover, the framework agreed for the PSPP and PEPP was far from exhausted at the end of 2020. However, the market yield on government bonds in the euro area is currently still somewhat lower than in previous years.

Bond holdings to grow further

However, if monetary policy takes on a new, less expansionary stance, things could change. Rising deposit rates would lead to pressure on earnings in the short term and then eat into or eat up profits from purchasing bonds – if no risk provisions have been set up already as a precautionary measure. If interest rates were to rise, bond sales would also result in losses, in particular for long-term securities. This, too, would have an impact on central bank profits and, at the least, lower potential profit distribution for an extended period of time. Depending on its scale, an interest rate reversal can even lead to negative annual results. For instance, a one percentage point rise in the deposit rate and excess liquidity of 40% of GDP, amid otherwise unchanged conditions, would directly result in additional annual interest expenditure of 0.4% of GDP for central banks. This would mean around €48 billion for the euro area as a whole each year, and €14 billion for Germany.

Rising interest rates weigh on central bank balance sheets

²¹ See Deutsche Bundesbank (2021), pp. 65 f.

²² To the extent that risk sharing is excluded under the PSPP and PEPP, no sovereign solvency risk is redistributed among the national central banks. The national central banks therefore receive the risk premia and may set up risk provisions.

²³ The relative significance compared to economic output is higher the further the share in the purchase programme lies above the share of the country's GDP and the greater the number of government bonds held in other portfolios.

Government bond purchases counteract extended maturity structure of government finances

Effective maturity transformation makes government finances more sensitive to changes in interest rates

All in all, through various channels and lower interest rates, Eurosystem bond purchases help to ease the burden on government finances. In the current low interest rate environment, governments are often advised to extend maturities and increasingly turn to long-term bonds. A trend in this direction can indeed be observed. The intention behind this is to secure low interest rates for the long term. However, it is all too often neglected that a central bank's government bond purchases have the same ef-

fect as shortening the average interest rate lock-in period. Through the link between government and central bank balance sheets, as soon as bonds are purchased, they effectively switch from the medium to long-term market conditions to the risk-free central bank interest rate. Taken in isolation, the short-term fiscal advantage of central bank purchases is therefore greater the more expensive a country's market financing. At the same time, the government budgets of all euro area countries become increasingly dependent on changes in the short-term interest rates. This counteracts the extended maturity structure of government bonds.

Federal debt: allocate premia on accruals basis in budgetary interest expenditure

In recent years, the Federal Government's interest expenditure has fallen sharply. This was largely due to the lower interest rate level. However, another factor was that interest expenditure is not recorded on an accruals basis in the Federal budget. This primarily concerns premia on new securities at the time of issue.

Premia accrue when a security's coupon is higher than the market interest rate. This premium on the redemption price is paid when the security is purchased. The greater the difference between the coupon and market rate, and the longer the interest rate lock-in period of the security, the higher the premium becomes.

These premia are recorded in the Federal budget immediately and in full as negative interest expenditure, and only the coupon payments are subsequently recorded over the remaining term. As a result, interest expenditure is not spread evenly (on an accruals basis) over the term. Using this accounting practice, premia ease the pressure on debt brake limits in the short term, at the expense of future budgets. Interest expenditure and hence budget outturns become both more volatile and more difficult to rank.

The volume of premia received in the Federal budget has risen sharply in recent years. In the decade up to 2010, they averaged €½ billion; in the last decade they came to €4 billion. A peak of almost €12 billion was reached in 2020, equating to 2½% of total expenditure in the Federal budget. The premia received thus reduced reported interest expenditure by just under two-thirds.

Switching to recording interest expenditure on an accruals basis in future would be more appropriate from an economic perspective, and would have a number of other advantages. It should be possible to make the switch without any major difficulties. This would make it easier to identify the actual budgetary situation. The interest burden on budgets would be stabilised, while budget outturns could be better planned as well as becoming less erratic. The switch would also be more in keeping with the intention of the debt brake, doing away with one possibility of circumventing it. Lastly, changing the way in which premia are recorded would also better ensure compliance with the European rules.

How premia arise when issuing securities

Federal securities traditionally pay fixed coupon

The Federal Government can close funding gaps in its budget by issuing debt, for which upper limits are set by the fiscal rules. At the end of 2020, the debt level in the Federal Government's core budget (as defined by the Stability Council) came to €1,163 billion, or 35% of gross domestic product. The vast majority of this Federal debt is attributable to securities issued in the capital market. These securities have to pay interest commensurate with market conditions at the time of issue. Amounts falling due annually are usually paid in the form of fixed coupons.¹ For Treasury discount paper with maturities of up to one year (Bubills), interest is paid as the difference between the issue price and par value.² For inflation-linked securities, such payment is made in addition to the coupons by adjusting the redemption amount to the price index performance. In the case of conventional securities (with a coupon), too, portions of the interest can be paid as differences between the issue price and par value. If a newly issued instrument's coupon is higher than the market rate, the issue price exceeds the par value, producing a premium. The greater the difference between the coupon and market rate, and the longer the interest rate lock-in period of the security, the higher the premium becomes.³

Bond series with several taps one factor behind premia ...

The Federal Government generally aims to issue a relatively high volume of its individual series of securities. This increases the liquidity of the instruments and thus reduces the liquidity-related interest surcharge as part of the total financing costs. In order to reach the target volumes, the individual series are normally issued (brought onto the market) in multiple tranches. In other words, the initial issue of a series is subsequently topped up by sales of additional taps.⁴ While the coupon for the initial issue is generally geared to the prevailing capital market rate, it can deviate more strongly from this in subsequent taps. If the capital market rate has fallen in the meantime, the issue price that

the Federal Government charges when selling securities rises.

A long interest rate lock-in period can easily result in a sizeable premium. In 2014, for example, a 30-year Federal bond (Bund) was launched with a coupon of 2.5%, in line with market conditions. At the time of the last tap in the summer of 2019, its market yield was just ¼%. This resulted in an extremely large premium of 60% of par value.

... of sizeable amounts in some cases

There have been considerable premia in recent years. Given the above-described issue strategy pursued by the Federal Government, this is because yields on Federal securities have declined sharply overall since the financial and economic crisis of 2008-09. For some time now, negative yields have even been recorded – extending into the 30-year maturity band at the lowest point. When interest rates are negative, significant premia occur right from initial issuance, because coupons do not have a negative interest rate. This has also affected the most important instrument, the ten-year Bund, with one series even generating a premium of just over 5% of par value. In addition, given the favourable conditions, the Federal Government has issued long-dated securities on a particularly large scale. The premia on these were especially high. On balance, the total premia received by the Federal Government have risen strongly in the past few years. In 2020, they doubled to nearly €12 billion on the back of very extensive issuance related to the COVID-19 crisis.

Negative interest rates also produce significant premia for long-dated bonds

¹ The coupon securitises the claim to payment of interest and states the nominal interest rate of a security. This deviates from the constantly changing general market rate. The market rate (also known as the effective interest rate or yield) takes into account the nominal interest rate as well as the difference between the market price and redemption value, spread over the term of the security.

² A security's par value is the amount that the issuer has to pay to the purchaser at maturity (redemption value).

³ If the coupon is lower than the market rate, there is a discount. The following remarks would then apply with the sign reversed.

⁴ The Federal Government also sells securities from its own holdings over time. It holds these back from issues, not least to enable it to intervene to smooth price swings (market smoothing).

Advantages of accrual accounting for premia in the Federal budget⁵

Record interest from premia over term

In the Federal budget, coupon payments are recognised in the year they fall due, which means that they are spread evenly over the term of the securities.⁶ For premia, on the other hand, the current practice is to record them in full as negative interest expenditure (affecting the budget balance) in the year the securities are sold. This means that they reduce interest expenditure only in the year of sale. From an economic perspective, however, the time at which interest burdens are recorded should not depend on whether they take the form of coupons or premia. It was on the basis of this guiding principle that the Federal Government set up a special fund as provision for additional payments when redeeming inflation-linked debt instruments. Each year, the Federal budget transfers the additional accrued obligations for inflation adjustment to this special fund. Hence, this type of interest burden is recorded on an accruals basis. The following sections will initially outline how premia, too, can be recorded on an accruals basis in the Federal budget in future – similarly to what the basic rules of the national accounts intend.

Technical implementation of accrual accounting

Technically speaking, the premium would be recorded as borrowing at the time the security is sold. Thus, the borrowing would consist of the par value plus the premium (to be amortised over time). Compared with the current situation, then, higher borrowing (and equally no negative impact on interest expenditure) would initially be reported. Part of the future coupon payments would then no longer constitute interest expenditure, but rather repayments of this additional borrowing (the amount above the market rate at the time the security is sold).⁷ This would mean that interest payments are recorded evenly year by year, both in the budget and for the debt brake.⁸

There would be significant advantages to taking this more economically appropriate ap-

Premia in the Federal budget

 Deutsche Bundesbank

proach to recording premia (and discounts) in the Federal budget. First, it would be more in keeping with the objective of the debt brake. The rule is intended to limit borrowing and hence implicit legacy burdens on future budgets. If premia are deducted from interest expenditure in the year of issue, as has so far been the case, the objective of the debt brake is in effect undermined: the premia provide relief in the short term, whereas future budgets are saddled with greater burdens from higher interest expenditure than implied by the market rate when the security was issued. What this essentially does is ease the pressure on the debt brake in the short term, without the sub-

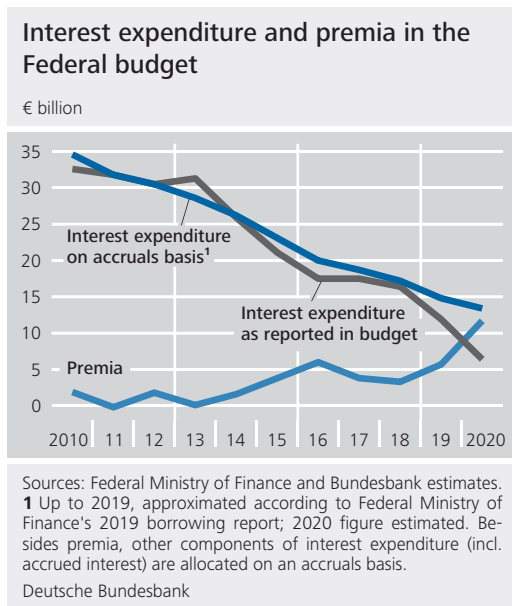

Advantages: recognition as borrowing reduces legacy burden on future budgets and enhances transparency

⁵ See also Deutsche Bundesbank (2017).

⁶ The first coupon sometimes covers a somewhat longer period, since interest can begin accruing more than one year before the coupon date. If the instruments are sold after interest begins accruing or after a coupon date, accrued interest has to be paid upon acquisition. This is repaid by the Federal Government on the next coupon date.

⁷ A smaller portion of the deviation between the coupon and market rate obviously reflects interest on the premium in line with market conditions.

⁸ Compared with the current accounting practice, premia recorded as borrowing are offset by additional interest expenditure. The immediate relief that premia have previously provided for the debt brake is thus eliminated. It is spread over the entire term: to do so, the repayment component (for additional borrowing, in the amount of the premium) is deducted from the coupon payments. As a result, this does not represent a burden on the budget under the debt brake. Thus, the yield required by the capital market at the time of issue is accounted for throughout, instead of recording the full relief provided by premia at the time of issue.

sequent burdens that this brings with it being disclosed. Ultimately, this could even create a political incentive to issue securities with large coupons in order to use the premia on these as a way of building up extra budgetary scope.⁹ In the case of premia, if the switch were made to accrual accounting, this scope would be smaller than before in the year of issue and greater in subsequent years. By reporting interest on an accruals basis, it would then be possible, not least, to see the basic position of the Federal budget more transparently. It would not be obscured by any large premia.

Current accounting makes Federal budget unnecessarily volatile

Second, interest expenditure would be less volatile and could be planned fairly reliably. Between 2010 and 2020, premia fluctuated significantly from one year to the next, ranging from a marginal discount in 2011 to premia of almost €12 billion in 2020. The premia received thus reduced reported interest expenditure by just under two-thirds last year (see the above chart). Overall, outturns often deviated considerably from budget estimates – even though some of these had even been updated in supplementary budgets. At their peak, the deviations exceeded 1½% of total expenditure in the Federal budget, making them quite significant indeed. If premia included in the budget plans do not materialise, this can even result in the debt brake limits being breached. In the

2021 supplementary budget, one of the factors to trigger the increased borrowing requirement was lower premia. The relief provided by premia is set to be €3½ billion lower, because capital market rates are now higher. From this perspective, too, it is therefore advisable to record interest burdens in the Federal budget on an accruals basis and thus eliminate the volatility of premia.

Third, the debt brake is designed to ensure compliance with the European fiscal rules. The standardised national accounts are applicable to them. The rules governing national accounts essentially follow the economic perspective and stipulate that premia occurring when issuing securities be recorded over the life of the security as providing relief.

Switch in accounting practice would better ensure compliance with European requirements

If the budget accounts are already closed, the accounting method cannot be changed retroactively. However, to depict the economic relationship described here for past years as well, the Federal Government's existing debt brake control account can be considered: it records positive and negative deviations of budget outturns from the standard limits.¹⁰ In the years prior to the coronavirus crisis, the high premia, which were not being recorded on an accruals basis, increased the credit balances on this account. If the switch in accounting practice were made, as described here, those earlier premia would be allocated to future budgets on an accruals basis with an alleviating effect (reducing interest expenditure). In turn, the balance on the control account would need to be reduced

Swift implementation via control account possible and facilitated by activated escape clause

⁹ In its 2020 remarks, the Federal Court of Auditors points out that the impression of opportunity for misuse could arise (p. 21). The reasons why premia were so much higher in the decade following the introduction of the debt brake than in the decade before cannot be determined with certainty. Ultimately, however, declining and negative interest rates are likely to have been a crucial factor in this. The creation of additional budgetary scope, on the other hand, does not appear to have played a decisive role over this period.

¹⁰ Where these deviations resulted in surpluses in the core budget, they were transferred to the reserves held separately from the control account. Due to the surpluses of 2015 to 2019, these reserves currently amount to €48 billion.

by the associated premia (not recorded on an accruals basis originally). This would see it shrink from €52 billion now to a little over €30 billion.¹¹ If the switch were made, interest expenditure would, on the one hand, be roughly €3 billion lower in the current year, given that the past premia would now be allocated such that they reduce interest. On the other hand, this year's premia would largely be allocated to subsequent years. This would make interest expenditure for 2021 around €4 billion higher than the budget estimate. On balance, the switch would create a burden of roughly €1 billion in the current budget plan.¹²

tails quite a number of problems. Recording interest expenditure on an accruals basis would be more appropriate from an economic perspective; it would make it easier to assess the actual budgetary situation, and it should be possible to implement the reform without any major difficulties. The interest burden on budgets would be stabilised, while budget outturns could be better planned and would become less erratic. The switch would also be more in keeping with the intention of the debt brake, doing away with one possibility of circumventing it. Lastly, changing the way in which premia are recorded would also better ensure compliance with the European rules.

Accrual accounting for interest would be advantageous and easy to implement

At least transparent auxiliary calculation advisable

In the event that there is no change to the budget accounting method, it would at least be advisable to include a transparent auxiliary calculation in the budget plan and budget account.¹³ This should depict the effects premia would have if the relief were recorded over the entire term on an accruals basis. In doing so, premia from previous years should be presented as well as those from the relevant budget. Overall, the auxiliary calculation should represent the structural burden of interest expenditure on the budget in a way that is easily understood.¹⁴

All things considered, there is much to be said for switching the accounting method for interest expenditure, particularly in the Federal budget. The current accounting approach en-

11 The estimated effects for 2020 are included for the sake of simplicity, rather than adjusting the outstanding repayment from the escape clause. For previous years, data from the Federal Ministry of Finance's 2019 borrowing report were used. Premia from before 2016 do not lower the balance on the control account, since the high legacy balance was already cancelled in full.

12 Since the escape clause is currently activated, additional burdens would result in the standard limits being exceeded by a greater margin. This would have to be compensated for in repayment plans for the future. In this specific arrangement, however, the higher overall repayment obligations would be counteracted by almost matching lower interest expenditure paid on premia.

13 The Federal Court of Auditors also proposes this kind of auxiliary calculation. See Federal Court of Auditors (2020), p. 22.

14 Up to now, the Federal Ministry of Finance has made such disclosures for Federal debt, including the off-budget entities financed by the Finance Agency, only in its borrowing reports. This means that this information is not available until the third quarter of the following year. See Federal Ministry of Finance (2020), p. 15.

Local government finances: how cash advances can be limited and budget imbalances avoided

Prior to the coronavirus crisis, local government finances were in good shape overall. Local government budgets recorded large surpluses, albeit with significant differences from municipality to municipality. Sizeable cash advances continued to persist in some federal states. Technically speaking, cash advances are only intended to bridge intra-year, short-term liquidity shortfalls and are supposed to be paid off by no later than the fiscal year-end. Despite this, they sometimes also span multiple years (i.e. periods extending beyond the fiscal year-end) to make up for budget shortfalls. Multi-year cash advances are thus indicative of local government budget imbalances that have not been resolved. However, it was possible in the pre-crisis years to reduce these advances by a total of one-quarter from their peak levels, in no small part thanks to state-run debt relief programmes. Now, as a result of the coronavirus crisis, there is a danger that local governments will increasingly turn to multi-year cash advances again to plug their budget gaps. While central government and state governments have largely shielded them from the financial impact of the crisis over the past year, revenue prospects are still lagging behind their pre-crisis levels over the medium term.

Federal states bear much of the responsibility for keeping their municipalities' finances in order. For one thing, they have to ensure the provision of adequate funding. For another, they are responsible for budgetary surveillance and have extensive powers of intervention.

There appear to be three big starting points for securing stable local government finances. First, a fundamental reform of local government financing to stabilise the currently volatile local government revenue would be a welcome development.

Second, federal states need to ensure that their municipalities' persistently high levels of cash advances are reduced. The spotlight here is on North Rhine-Westphalia and Rhineland-Palatinate, but also Saarland. Debt relief programmes run by federal states, such as the one in Hesse, appear to be sensible approaches to handing financial flexibility back to the local government level in the future. Programmes of this kind need to be accompanied by rules which, going forward, safeguard sound finances and enable location conditions to be of adequate quality.

Third, it is important to prevent structural budget imbalances from materialising in the future. This is conditional on federal states being consistent in their surveillance and addressing unwelcome developments early on. One stipulation could be that municipalities are only permitted to obtain cash advances that would not be repaid by the end of the fiscal year from their home state. The federal state would thus also formally assume liability, underscoring its shared responsibility. Local government financial problems would then be reflected in state government budgets and transparently disclosed to the public in the budgetary accounts. If the necessary borrowing were to also count towards federal states' debt brakes, this would provide them with an added incentive to prevent local government budget imbalances from emerging.

Local government budget rules and cash advances

Federal states bear much of the responsibility for keeping municipalities' finances in order

Municipalities can take on debt to fund investment. However, they are subject to relatively strict budget rules in the process. For example, the municipality is required to demonstrate that, looking ahead, it will be able to repay the debt from its current revenue. The federal states set out detailed budget rules to be followed by their municipalities, monitor compliance with these rules and also possess extensive powers of intervention.¹ Where necessary, they can demand that individual municipalities make adjustments before a budget is approved. Additionally, they have to ensure the provision of adequate funding. In this respect, they bear much of the responsibility for keeping their municipalities' finances in order. Regardless, some federal states have allowed local government budgets to slip, resulting in imbalances and even excess balance sheet debt.

Multi-year cash advances are a sign of structural funding gaps

At the central and state government levels, larger deficits are a sign of budget strains. This is less straightforward at the local government level, where deficits resulting from debt-financed investment can actually be a sign of financial strength. By contrast, large volumes of cash advances are a reliable indicator of weakness, as they are only actually intended to

bridge intra-year liquidity shortfalls. Multi-year cash advances are those that could not be repaid within one fiscal year, though.² They were taken out not to fund investment but rather to plug budget gaps. Large or growing volumes of multi-year cash advances are thus a sign of structural financial problems that have not yet been resolved. Thus, the likelihood of a municipality no longer being able to solve these problems on its own grows. Such instances of protracted financial problems and a potential inability to pay back debt are frequently followed by a lengthy consolidation period, often going hand in hand with low local government investment, making the location less attractive.³ In order to avert the unwelcome adverse effects of unsound finances, structural funding gaps have to be tackled swiftly and decisively. This is where the home state has a pivotal role to play.

Up to the early 1990s, multi-year cash advances were not common at the local government level. They then grew over many years, reaching a peak of around €51 billion at the end of 2015 (see the adjacent chart).⁴ They thus made up one-third of debt attributable to local government core budgets and off-budget entities. In the subsequent period up to the end of 2020, cash advances decreased to around €37 billion (1.1% of gross domestic product (GDP)), or one-quarter of aggregate local government debt. They remain a large item in many local government budgets, however.

Cash advances in decline for five years, but still sizeable ...

Local government cash advances

¹ These far-reaching opportunities to exert influence set the relationship between the federal states and their municipalities far apart from the relationship between central government and state governments within the German federal system and between the European Union as a supranational organisation and its largely fiscally autonomous Member States.

² In this article, “intra-year” and “multi-year” do not refer to a cash advance’s term. Instead, they describe whether a cash advance is paid off in the same fiscal year (intra-year cash advance) or whether it is still outstanding at the end of the fiscal year (multi-year cash advance). It is possible for a multi-year cash advance to be due in less than one year. The remainder of this article focuses on municipalities’ multi-year cash advances.

³ See Beznoska and Kauder (2020).

⁴ As a percentage of GDP, cash advances reached their peak in 2012 already (1.8%).

... and concentrated in small number of federal states

The average volume of local government cash advances varies widely across the federal states. Across all non-city states, it stood at around €480 per capita at the end of 2020, ranging from less than €20 in Thuringia to €1,610 in Rhineland-Palatinate. Very high per capita cash advance levels of over €1,000 were also recorded for Saarland (€1,410) and North Rhine-Westphalia (€1,180).

State-run debt relief programmes as a possible solution for high volumes of cash advances

Central government aid and state-run debt relief programmes supported scaling-back of cash advances

The scaling-back of multi-year cash advances went hand in hand with fiscal surpluses, which were partly attributable to expanded central government aid. This primarily took the form of assuming a larger share of the costs of social benefits and, for example, providing lump-sum funding to cover expenditure related to refugees. On top of this, individual federal states launched debt relief programmes. The first of these were set up over a decade ago already, with varying designs and degrees of success.

State-funded debt relief sensible provided it is appropriately structured

State-run debt relief programmes make sense where municipalities' own concerted efforts are no longer enough to make a significant dent in their large volumes of cash advances. In terms of design, it is crucial to ensure that undesirable incentives to take on further debt are limited. Various parameters come into play here. The federal state has to determine the extent to which it will take on accumulated debt from cash advances or participate in servicing this debt. It is also necessary to define the period of time over which the affected municipalities will contribute to financing. Clear conditions can support consolidation requirements. Examples of such conditions include specifications for non-personal tax multipliers, although requirements relating to personnel management would also be conceivable. Locational disadvantages can be related to budget problems. With that in mind, debt relief pro-

Local government cash advances by federal state

Sources: Federal Statistical Office and Bundesbank calculations. Deutsche Bundesbank

grammes need to be consistently integrated into the federal state's general regional policy, e.g. by also using available funding to invest in infrastructure within this framework.

In 2018, Hesse opted to take a comprehensive approach – establishing the “Hessenkasse” fund – by making state government funds available to service debt.⁵ Participating municipalities remain involved, however, by paying off half of their cash advances up to an upper limit. Repayments take the form of a fixed annual amount and can be stretched over a period of up to 30 years. At the same time,

“Hessenkasse” fund as example case: federal state assumes cash advance debt and tightens budget law at same time

⁵ Specifically, subject to approval by the municipality, cash advances were transferred to the state-owned WIBank (€5 billion). This debt was local government debt not covered on the balance sheet by financial assets. The federal state of Hesse provides state government funds for interest and principal payments via the off-budget “Hessenkasse” fund. Through this set-up, the transferred cash advances no longer count as explicit government debt included in the government finance statistics. However, they still count towards the general government Maastricht debt as they are recorded at the state government level.

Hesse tightened its budget law for all municipalities to prevent a sustained increase in cash advances in the future. Municipalities not supported by the fund were eligible to receive additional investment grants. All in all, an approach of this kind appears sensible. The programme combines debt relief by the federal state with mandatory participation by the affected municipalities and stricter budgetary oversight.⁶ This counteracts the undesirable incentive effect of debt relief programmes that cash advances might appear to present less of a burden to municipalities in the future.

No compelling case for assumption of cash advances by central government

There is a less compelling case, however, for central government to assume the debt from local government cash advances.⁷ It is the federal states that are ultimately responsible for the accumulation of cash advances. In the past, even relatively financially weak federal states were able to avoid such build-ups.⁸ Central government is badly placed to counteract the distorted incentives associated with assuming this debt, and prospective central government aid might well be holding back federal states with particularly high levels of cash advances from coming up with their own comprehensive solutions.

Approaches to stabilising local government finances and preventing a return to rising cash advances

Sound local government finances through steady revenue

If new imbalances are to be prevented and municipalities enabled to perform their tasks without disruption, a solution focusing on legacy debt alone is not enough. The pressure on local government budgets has been eased significantly in structural terms through various forms of central government aid. For example, central government's share in the costs of accommodation for those receiving unemployment benefit II was raised again in 2020, and significantly so. In the same year, the increased share of local business tax revenue that western German municipalities were required to pay to the federal states ceased to apply. Despite all this,

local government financing remains highly volatile, which could be remedied by means of a fundamental reform.⁹ Should it not be possible to deliver such a reform, the cyclical fluctuations in local government finances could be smoothed out at the state government level. In periods of economic weakness, the federal states would support their municipalities in accordance with the rules. During upswings, the state government budgets would then withhold the corresponding amount of additional revenue. Since federal states' debt brakes are limited to structural new borrowing, they would be compatible with such symmetrical cyclical strains on, and relief for, state government budgets.

In order to support sound local government finances, federal states need to demonstrate that their municipalities receive financing commensurate with the tasks of the latter through their local government financial equalisation schemes. To this end, it would be necessary to determine as transparently as possible, assuming a cost-effective approach, the financing requirements associated with mandatory municipal services. This is already compulsory in some federal states.

Ensure funding commensurate with tasks

⁶ Saarland took a similar approach: starting in 2020, the state took on repayment of €1 billion, or around half of its municipalities' cash advances, through its "Saarlandpakt" fund. The off-budget fund makes interest and principal payments for the cash advances it has assumed and is financed from the state's core budget. Municipalities are required to pay off their remaining cash advances out of surpluses by the end of 2064.

⁷ See Deutsche Bundesbank (2019).

⁸ In 2019, the Federal Government members of the Commission on Equivalent Living Conditions proposed that central government assume the debt from local government cash advances on a one-off basis. However, the proposal was not approved by those federal states with municipalities that already had scarcely any cash advance debt due to strict state-level budgetary oversight.

⁹ Starting points for such a reform were presented in greater detail in Deutsche Bundesbank (2020). For example, the weight of the highly volatile local business tax in the total tax revenue received at the local government level could be reduced. In return, the weight of more stable sources of revenue, such as municipalities' share of wage tax revenue, could be raised. This would change the distribution of wage tax nationally, but not increase the tax itself. Another possible option is to give municipalities the power to set their own local multipliers on the local government share of general income tax. In addition, local government financial equalisation could be stabilised by not passing temporary tax revenue shortfalls at the state government level through to the local government level.

Effective local government budgetary oversight

Additionally, local government budget rules could also be applied more rigorously. This could also involve the federal state making specific interventions in local government budgets if rules are violated. Effective budgetary oversight of this nature is ultimately also an important factor in maintaining room for manoeuvre in the future.

Issuance of multi-year cash advances via state government budgets to underscore responsibility at federal state level

Another option would be to reform local government budget rules to make them more effective. One stipulation could be that municipalities are only permitted to obtain cash advances that would not be repaid by the end of the fiscal year from their home state. Anchoring borrowing options in this way would underscore the latter's shared responsibility. Up to now, it has been for the most part assumed on the markets that, in the event of default, the federal states are liable for loans taken out by their municipalities. For this reason, multi-year cash advances are made available at comparatively favourable conditions, even when municipalities find themselves in financial difficulties. Given the silent nature of this financing, the problem of cash advances also threatens to stay off the political radar. The proposed change would result in the federal states being directly and solely affected by difficulties in repaying cash advances, which would provide clarity at the state and local government levels as well as for the capital market regarding accountability. Municipalities' planned multi-year cash advances would then be disclosed annually in state government budgets and outturns.¹⁰ Financial problems at the local government level would thus be presented transparently, on an annual basis at fiscal year-end close and, at the latest, in the budgetary accounts.¹¹

Counting multi-year cash advances towards debt brakes will oblige federal states to resolve imbalances as quickly as possible

Federal states' debt brakes place severe restrictions on their ability to borrow. As a result, there is an incentive for the federal states to keep local government financial equalisation tight in order to relieve the pressure on their own budgets. This would also be the case if – as outlined above – municipalities were only permitted to obtain multi-year cash advances from their home state. As long as it is formally

assumed when lending these funds that the advances are not ultimately transfers, as financial transactions they do not usually count towards the state's debt brake. However, since the use of cash advances over multiple years indicates that the recipient municipality is currently unable to make regular repayments, this classification does not seem appropriate. It would therefore make sense to count multi-year local government cash advances towards federal states' borrowing under their debt brakes. Insofar as local government underfunding is reflected in growing multi-year cash advances, responsibility for this development would then rest with the federal state.¹² The federal states' budgetary oversight keeps them protected from being put under pressure by their municipalities through excessive expenditure.

Irrespective of such a reform, it would make sense to flag state-specific strains in local government finances in a transparent manner. This would raise awareness of the problem. For example, in its budget analysis for individual federal states, the Stability Council could highlight local government cash advances in a dedicated population-based indicator.¹³ If a certain threshold is exceeded in the previous year, this would sound an alarm in budgetary surveillance. The federal state concerned could then be prompted to adopt specific measures aimed at stabilising local finances.¹⁴

Transparent reporting by Stability Council

¹⁰ As a rule, it is unlikely when a federal state is drawing up its budget plan that more than a handful of budgets for the state's numerous municipalities will have already been approved. However, the state-level financial supervisors overseeing local government finances could provide plausible estimates here. If, as time went on, greater local government needs led to additional financing requirements, a supplementary budget would have to be adopted.

¹¹ If the municipalities receive cash advances at standardised terms and the federal states themselves raise capital in the capital market, transaction and interest costs for municipalities could also fall.

¹² See Deutsche Bundesbank (2016).

¹³ See Deutsche Bundesbank (2018).

¹⁴ Possible starting points for such measures would then, in turn, be multipliers for non-personal taxes, local government expenditure in relation to appropriate benchmarks as well as the allocation and distribution of funds in the local government financial equalisation scheme.

* The data in this table are based on the consolidated balance sheet of monetary financial institutions (MFIs) (Table II.2); statistical breaks have been eliminated from the flow figures (see also the "Notes on the figures" in the "Explanatory notes" of the Statistical Series Banking Statistics). ¹ Source: ECB. ² Excluding MFIs' portfolios. ³ After

deduction of inter-MFI participations. ⁴ Including the counterparts of monetary liabilities of central governments. ⁵ Including the monetary liabilities of central governments (Post Office, Treasury). ⁶ In Germany, only savings deposits. ⁷ Paper held by residents outside the euro area has been eliminated. ⁸ Less German MFIs' holdings

euro banknotes put into circulation by the Bundesbank in accordance with the accounting regime chosen by the Eurosystem (see also footnote 2 on banknote circulation in Table III.2). The volume of currency actually put into circulation by the

Bundesbank can be calculated by adding to this total the item "Intra-Eurosystem liability/claim related to banknote issue" (see "Other liability items"). ⁵ Excluding central governments' deposits. ⁶ In Germany, only savings deposits.

* Monetary financial institutions (MFIs) comprise banks (including building and loan associations), money market funds, and the European Central Bank and national central banks (the Eurosystem). **1** Source: ECB. **2** In Germany, only savings deposits. **3** Excluding holdings of MFIs; for the German contribution, excluding German MFIs' portfolios of securities issued by MFIs in the euro area. **4** In Germany, bank debt securities with maturities of up to one year are classed as money market paper.

5 Excluding liabilities arising from securities issued. **6** After deduction of inter-MFI participations. **7** The German contributions to the Eurosystem's monetary aggregates should on no account be interpreted as national monetary aggregates and are therefore not comparable with the erstwhile German money stocks M1, M2 or M3. **8** Including DEM banknotes still in circulation (see also footnote 4 on p. 10*). **9** For the German contribution, the difference between the volume of euro banknotes

Discrepancies may arise from rounding. * The banking system's liquidity position is defined as the current account holdings in euro of euro area credit institutions with the Eurosystem. Amounts are derived from the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. ¹ Figures are daily averages for the reserve maintenance period ending in the month indicated. Following the changeover in the frequency of Governing Council monetary policy meetings to a six-week cycle, a reserve maintenance period no longer ends in every month. No figures

are available in such cases. ² Source: ECB. ³ Includes liquidity provided under the Eurosystem's asset purchase programmes. ⁴ From August 2009 includes liquidity absorbed as a result of the Eurosystem's foreign exchange swap operations. ⁵ From 2002 euro banknotes and other banknotes which have been issued by the national central banks of the Eurosystem and which are still in circulation. In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is

II. Overall monetary survey in the euro area

allocated to the ECB on a monthly basis. The counterpart of this adjustment is shown under "Other factors". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly basis, to the NCBs, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro banknotes allocated to an NCB and the value of the euro banknotes which that NCB has put into circulation is likewise shown under "Other factors". From 2003 euro

banknotes only. **6** Remaining items in the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. **7** Equal to the difference between the sum of liquidity-providing factors and the sum of liquidity-absorbing factors. **8** Calculated as the sum of the "Deposit facility", "Banknotes in circulation" and "Credit institutions' current account balances".

III. Consolidated financial statement of the Eurosystem

* The consolidated financial statement of the Eurosystem comprises the financial statement of the European Central Bank (ECB) and the financial statements of the national central banks of the euro area Member States (NCBs). The balance sheet items for foreign currency, securities, gold and financial instruments are valued at market

rates at the end of the quarter. ¹ In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is allocated to the ECB on a monthly basis. The counterpart of this adjustment is disclosed as an "Intra-Eurosystem liability related to

III. Consolidated financial statement of the Eurosystem

euro banknote issue". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly basis, to the NCBs, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro

banknotes allocated to the NCB according to the aforementioned accounting procedure and the value of euro banknotes put into circulation is also disclosed as an "Intra-Eurosystem claim/liability related to banknote issue". ² For the Deutsche Bundesbank: including DEM banknotes still in circulation. ³ Source: ECB.

IV. Banks

1. Assets and liabilities of monetary financial institutions (excluding the Deutsche Bundesbank) in Germany *

* This table serves to supplement the "Overall monetary survey" in Section II. Unlike the other tables in Section IV, this table includes - in addition to the figures reported by

banks (including building and loan associations) - data from money market funds.
1 See footnote 1 in Table IV.2. 2 Excluding deposits of central governments.

IV. Banks

in other Member States ²				Deposits of central governments		Liabilities arising from repos with non-banks in the euro area	Money market fund shares issued ³	Debt securities issued ³		Liabilities to non-euro area residents	Capital and reserves	Other Liabilities ¹	Period
With agreed maturities		At agreed notice		Total	of which: domestic central governments			Total	of which: with maturities of up to 2 years ³				
Total	of which: up to 2 years	Total	of which: up to 3 months

* Assets and liabilities of monetary financial institutions (MFIs) in Germany. The assets and liabilities of foreign branches, of money market funds (which are also classified as MFIs) and of the Bundesbank are not included. For the definitions of the respective items, see the footnotes to Table IV.3. ¹ Owing to the Act Modernising Accounting Law (*Gesetz zur Modernisierung des Bilanzrechts*) of 25 May 2009, derivative financial instruments in the trading portfolio (trading portfolio derivatives) within the meaning of Section 340e(3) sentence 1 of the German Commercial Code (*Handels-*

gesetzbuch) read in conjunction with Section 35(1) number 1a of the Credit Institution Accounting Regulation (*Verordnung über die Rechnungslegung der Kreditinstitute*) are classified under "Other assets and liabilities" as of the December 2010 reporting date. Trading portfolio derivatives are listed separately in Statistical Supplement 1 to the Monthly Report – Banking statistics, in Tables I.1 to I.3. ² For building and loan associations: including deposits under savings and loan contracts (see Table IV.12). ³ Included in time deposits. ⁴ Excluding deposits under savings and

¹ The reserve maintenance period starts on the settlement day of the main refinancing operation immediately following the meeting of the Governing Council of the ECB for which the discussion on the monetary policy stance is scheduled. ² Article 3 of the Regulation of the European Central Bank on the application of minimum reserves (excluding liabilities to which a reserve ratio of 0% applies, pursuant to Article 4(1)). ³ Amount after applying the reserve ratio to the reserve base. The reserve ratio for

liabilities with agreed maturities of up to two years was 2% between 1 January 1999 and 17 January 2012. Since 18 January 2012, it has stood at 1%. ⁴ Article 5(2) of the Regulation of the European Central Bank on the application of minimum reserves. ⁵ Average credit balances of credit institutions at national central banks. ⁶ Average credit balances less required reserves after deduction of the lump-sum allowance. ⁷ Required reserves after deduction of the lump-sum allowance.

* The interest rate statistics gathered on a harmonised basis in the euro area from January 2003 are collected in Germany on a sample basis. The MFI interest rate statistics are based on the interest rates applied by MFIs and the related volumes of euro-denominated deposits and loans to households and non-financial corporations domiciled in the euro area. The household sector comprises individuals (including sole proprietors) and non-profit institutions serving households. Non-financial corporations include all enterprises other than insurance corporations, banks and other financial institutions. The most recent figures are in all cases to be regarded as provisional. Subsequent revisions appearing in the following Monthly Report are not specially marked. Further information on the MFI interest rate statistics can be found on the Bundesbank's website (Statistics/Money and capital markets/Interest rates and yields/Interest rates on deposits and loans). ° The statistics on outstanding amounts are collected at the end of the month. 1 The effective interest rates are calculated either as

annualised agreed interest rates or as narrowly defined effective rates. Both calculation methods cover all interest payments on deposits and loans but not any other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance. 2 Data based on monthly balance sheet statistics. 3 Secured and unsecured loans for home purchase, including building and home improvements; including loans granted by building and loan associations and interim credits as well as transmitted loans granted by the reporting agents in their own name and for their own account. 4 Loans for consumption are defined as loans granted for the purpose of personal use in the consumption of goods and services. 5 For the purpose of these statistics, other loans are loans granted for other purposes such as business, debt consolidation, education, etc. 6 Including overdrafts (see also footnotes 12 to 14 on p. 47).

For footnotes * and 1 to 6, see p. 44*. For footnote x see p. 47*. + For deposits with an agreed maturity and all loans excluding revolving loans and overdrafts, credit card debt: new business covers all new agreements between households or non-financial corporations and the bank. The interest rates are calculated as volume-weighted average rates of all new agreements concluded during the reporting month. For overnight deposits, deposits redeemable at notice, revolving loans and overdrafts, credit card debt: new business is collected in the same way as outstanding amounts for the sake of simplicity. This means that all outstanding deposit and lending business at

the end of the month has to be incorporated in the calculation of average rates of interest. 7 Estimated. The volume of new business is extrapolated to form the underlying total using a grossing-up procedure. 8 Including non-financial corporations' deposits; including fidelity and growth premiums. 9 Excluding overdrafts. 10 Annual percentage rate of charge, which contains other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance.

For footnotes * and 1 to 6, see p. 44*. For footnotes + and 7 to 10, see p. 45*;
11 For the purposes of the interest rate statistics, a loan is considered to be secured if collateral (amongst others financial collateral, real estate collateral, debt securities) in at least the same value as the loan amount has been posted, pledged or assigned.
12 Including revolving loans which have all the following features: (a) the borrower may use or withdraw the funds to a pre-approved credit limit without giving prior notice to the lender; (b) the amount of available credit can increase and decrease as funds are borrowed and repaid; (c) the loan may be used repeatedly; (d) there is no obligation of regular repayment of funds. **13** Overdrafts are defined as debit balances

on current accounts. They include all bank overdrafts regardless of whether they are within or beyond the limits agreed between customers and the bank. **14** Including convenience and extended credit card debt. Convenience credit is defined as the credit granted at an interest rate of 0% in the period between payment transactions effected with the card during one billing cycle and the date at which the debt balances from this specific billing cycle become due. **15** The amount category refers to the single loan transaction considered as new business. **x** Dominated by the business of one or two banks. Therefore, the value cannot be published due to confidentiality.

Sources: The calculations for the insurance sectors are based on supervisory data according to Solvency I and II. Pension funds data are compiled using Solvency I supervisory data, supplemented by voluntary reports and own calculations. * Valuation of listed securities at the corresponding consistent price from the ESCB's securities database. ¹ Accounts receivable to monetary financial institutions, including registered bonds, borrowers' note loans and registered Pfandbriefe. ² Including deposits retained

on assumed reinsurance as well as registered bonds, borrowers' note loans and registered Pfandbriefe. ³ Not including the reinsurance business conducted by primary insurers, which is included there. ⁴ The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included.

Sources: The calculations for the insurance sectors are based on supervisory data according to Solvency I and II. Pension funds data are compiled using Solvency I supervisory data, supplemented by voluntary reports and own calculations. ¹ Including deposits retained on ceded business as well as registered bonds, borrowers' note loans and registered Pfandbriefe. ² Insurance technical reserves "life" taking account of transitional measures. Health insurance is also included in the "non-life insurance" sector.

³ Not including the reinsurance business conducted by primary insurers, which is included there. ⁴ The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included. ⁵ Own funds correspond to the sum of net worth and the liability item "Shares and other equity".

1 Bearer debt securities with maximum maturities according to the terms of issue of over 4 years. Structured debt securities, debt securities with unscheduled redemption, zero coupon bonds, floating rate notes and bonds not denominated in Euro are not included. Group yields for the various categories of securities are weighted by the amounts outstanding of the debt securities included in the calculation. Monthly figures

are calculated on the basis of the yields on all the business days in a month. The annual figures are the unweighted means of the monthly figures. Adjustment of the scope of securities included on 1 May 2020. 2 End of year or month. 3 Source: Deutsche Börse AG. 4 Only debt securities eligible as underlying instruments for futures contracts; calculated as unweighted averages.

Source: Bundesbank calculations based on Federal Statistical Office data. ¹ Annual figures based on the calculations of the Federal Statistical Office. Bundesbank supplementary estimations for the reporting years after 2011 that are not yet available. The quarterly figures contain numerous off-budget entities which are assigned to the general government sector as defined in the national accounts but are not yet included in the annual calculations. From 2012 also including the bad bank FMSW. ² The annual figures do not tally with the sum of the quarterly figures, as the

later are all provisional. The quarterly figures for some insurance sectors are estimated. ³ The development of the types of expenditure recorded here is influenced in part by statistical changeovers. ⁴ Including discrepancies in clearing transactions between central, state and local government. ⁵ On the revenue side, this contains proceeds booked as disposals of equity interests and as loan repayments. On the expenditure side, this contains the acquisition of equity interests and loans granted. ⁶ Including central government liquidity assistance to the Federal Employment Agency.

Source: Federal Ministry of Health. * The final annual figures generally differ from the total of the reported provisional quarterly figures as the latter are not revised subsequently. 1 Including transfers to the long-term care provident fund. 2 Since 2005 including special contributions for childless persons (0.25% of income subject to insur-

ance contributions). 3 Data revision in 2017. Comparability with previous values is therefore very limited. 4 Until 2016 only full inpatient nursing care. From 2017, also includes benefits for short-term care and daytime/night-time nursing care, inter alia. 5 For non-professional carers.

Sources: Federal Statistical Office; Federal Employment Agency. * Annual and quarterly figures: averages; calculated by the Bundesbank; deviations from the official figures are due to rounding. **1** Workplace concept; averages. **2** Monthly figures: end of month. **3** Number within a given month. **4** Mid-month level. **5** Relative to the total civilian labour force. **6** Excluding government-assisted forms of employment and seasonal jobs, including jobs located abroad. **7** From January 2017 persons receiving additional income assistance (unemployment benefit and unemployment benefit II at the same time) shall be assigned to the legal category of the Third Book of the Social Security

Code (SGB III). **8** Statistical break due to late recording of unemployed persons in the legal category of the Second Book of the Social Security Code (SGB II). **9** Unadjusted figures estimated by the Federal Employment Agency. In 2018 and 2019, the estimated values for Germany deviated from the final data by a maximum of 0.1% for employees subject to social contributions, by a maximum of 0.7% for persons solely in jobs exempt from social contributions, and by a maximum of 55.3% for cyclically induced short-time work. **10** Initial preliminary estimate by the Federal Statistical Office. **11** From May 2021, calculated on the basis of new labour force figures.

* Non-financial groups admitted to the Prime Standard segment of the Frankfurt Stock Exchange which publish IFRS consolidated financial statements on a quarterly or half-yearly basis and make a noteworthy contribution to value added in Germany. In some cases revised. Excluding groups engaged in real estate activities. ¹ Including cash

equivalents. ² Including groups in agriculture and forestry. ³ From H1 2018 or 2018 onwards: significant changes in IFRS standards, impairing comparability with previous periods.

XI. Economic conditions in Germany

11. Revenues and operating income of listed non-financial groups *

Period	Revenues		Operating income before depreciation and amortisation (EBITDA 1)		Operating income before depreciation and amortisation (EBITDA 1) as a percentage of revenues					Operating income (EBIT)		Operating income (EBIT) as a percentage of revenues

* Non-financial groups admitted to the Prime Standard segment of the Frankfurt Stock Exchange which publish IFRS consolidated financial statements on a quarterly or half-yearly basis and make a noteworthy contribution to value added in Germany. In some cases revised. Excluding groups engaged in real estate activities. 1 Earnings before interest, taxes, depreciation and amortisation. 2 Quantile data are based on the groups' unweighted return on sales. 3 Annual figures do not always match the sum of

the two half-year figures. See Quality report on consolidated financial statement statistics, p. 3. 4 Adjusted for substantial changes in the basis of consolidation of large groups and in the reporting sample. See the explanatory notes in Statistical Series Seasonally adjusted business statistics. 5 Including groups in agriculture and forestry. 6 From this point onwards: significant changes in IFRS standards, impairing comparability with previous periods.

* Assets and liabilities vis-à-vis all countries within and outside the euro area. Up to December 2000 the levels at the end of each quarter are shown, owing to revaluations, at market prices; within each quarter, however, the levels are computed on the basis of cumulative transaction values. From January 2001 all end-of-month levels are valued at market prices. **1** Mainly net claims on TARGET2 balances (acc. to the respective country designation), since November 2000 also balances with non-euro area central banks

within the ESCB. **2** Mainly long-term debt securities from issuers within the euro area. **3** Including estimates of currency in circulation abroad. **4** See Deutsche Bundesbank, Monthly Report, October 2014, p. 22. **5** Difference between External assets and External liabilities. **6** Euro opening balance sheet of the Bundesbank as at 1 January 1999.

XII. External sector

8. External positions of enterprises *

€ million

* The effective exchange rate corresponds to the weighted external value of the currency concerned. The method of calculating the indicators of the German economy's price competitiveness is consistent with the procedure used by the ECB to compute the effective exchange rates of the euro. A decline in the figures implies an increase in competitiveness. The weights are based on trade in manufactured goods and services. For more detailed information on methodology and weighting scale, see the website of the Deutsche Bundesbank (<https://www.bundesbank.de/content/796162>). 1 ECB calculations are based on the weighted averages of the changes in the bilateral exchange rates of the euro vis-à-vis the currencies of the following countries: Australia, Bulgaria, Canada, China, Croatia, Czechia, Denmark, Hong Kong, Hungary, Japan, Norway, Poland, Romania, Singapore, South Korea, Sweden, Switzerland, the United Kingdom and the United States. Where current price and wage indices were not avail-

able, estimates were used. 2 ECB calculations. Includes countries belonging to the group EER-19 and additionally Algeria, Argentina, Brazil, Chile, Colombia, Iceland, India, Indonesia, Israel, Malaysia, Mexico, Morocco, New Zealand, Peru, Philippines, the Russian Federation, Saudi Arabia, South Africa, Taiwan, Thailand, Turkey, Ukraine and United Arab Emirates. 3 Annual and quarterly averages. 4 Euro area countries (from 2001 including Greece, from 2007 including Slovenia, from 2008 including Cyprus and Malta, from 2009 including Slovakia, from 2011 including Estonia, from 2014 including Latvia, from 2015 including Lithuania) as well as Canada, Denmark, Japan, Norway, Sweden, Switzerland, the United Kingdom and the United States. 5 Euro area countries (current composition) and countries belonging to the group EER-19. 6 Euro area countries (current composition) and countries belonging to the group EER-42.

Overview of publications by the Deutsche Bundesbank

This overview provides information about selected recent economic and statistical publications by the Deutsche Bundesbank. Unless otherwise indicated, these publications are available in both English and German, in printed form and on the Bundesbank's website.

The printed publications are available free of charge to interested parties and may be obtained through the Bundesbank's order portal. Up-to-date figures for selected statistical datasets are available on the Bundesbank's website. In addition, the new Statistical Series provide a new basic structure and advanced options for using data and are also available on the Bundesbank's website.

■ Annual Report

■ Financial Stability Review

■ Monthly Report

A list of the articles published in the period from 2010 to 2020 is available on the Bundesbank's website.

Monthly Report articles

August 2020

- The current economic situation in Germany

September 2020

- The impact of monetary policy on the euro's exchange rate
- Global financial interconnectedness and spillovers between the G20 countries
- The performance of German credit institutions in 2019

October 2020

- Developments in the German banking system during the negative interest rate policy period
- Patterns of international business cycles
- The protracted rise in residential property prices in Germany from a macroeconomic perspective: transmission channels and fundamental determinants
- State government budgets: results for 2019

November 2020

- The current economic situation in Germany

December 2020

- Outlook for the German economy for 2021 to 2023
- The informative value of national fiscal indicators in respect of debt at the European level
- Risk Reduction Act – the national implementation of the European banking package
- German enterprises' profitability and financing in 2019
