■ The current economic situation in Germany

Overview

Stronger global inflation triggers shift in monetary policy stance

Global economy probably regained some momentum in Q4

Global economic growth is likely to have picked up again somewhat in the final quarter of 2021. However, economic developments were quite varied from region to region. In the United States, real gross domestic product saw a return to strong growth due to factors limiting production easing off to a certain extent and COVID-19 cases tailing off. In China, the normalisation of the power supply contributed to more dynamic growth. In the euro area, meanwhile, the upswing was significantly weakened as containment measures were tightened and consumer behaviour became more cautious once again.

Marked recovery in industry; temporarily increased burdens on service providers

The acceleration of global economic growth was attributable not least to industry, and in Germany, specifically to car manufacturers. The worldwide shortage of highly sought-after semiconductor components persisted. That said, the situation eased somewhat with the recovery of production in South-East Asia. This had been restricted for some time due to the pandemic. Amid the rapid spread of the Omicron variant, there is currently a risk of supply-side obstacles becoming worse again. However, the consequences of the spread of this variant will probably be significantly less disruptive to high-contact service sectors than was the case with previous waves of infection. Containment measures have generally been tightened to no more than a moderate degree, or have even been relaxed most recently due to the fact that, in many places, the virus variant is infecting largely vaccinated populations and fewer infected people are becoming severely ill. However, the high case numbers mean that more people are required to isolate or quarantine, hampering economic activity. Even so, judging by the experiences of other countries, the Omicron wave could subside quickly, mean-

ing that the burdens it brings with it are likely to be quite short-lived.

In view of the improved demand outlook and a strained supply situation, crude oil prices have risen considerably of late. Gas prices in Europe dipped slightly at the start of January after having reached record highs in December 2021. Due to the protracted political crisis between Russia and Ukraine, however, the cost of future gas flows became significantly more expensive, and futures suggest that gas prices will stay high for the remainder of the year.

Further rise in crude oil prices; gas prices persistently high

High energy prices made a substantial contribution to the renewed rise in global consumer price inflation. According to an initial estimate, the year-on-year rate of change up to January in consumer prices for the industrial countries as a whole rose to 5.8%. But even defined more narrowly, i.e. excluding energy and food, the inflation rate climbed to 4.3%, which is indicative of broader-based inflation. This development was driven by buoyant demand coupled with high cost pressures initially resulting chiefly from price increases at upstream production stages and for transport services. Moreover, some industrial countries were already experiencing accelerated wage growth. Against this backdrop, many central banks tightened their monetary policy stance or at least considered doing so.

Renewed rise in consumer price inflation in industrial countries; central banks signal policy tightening

Mounting inflationary risks also shaped developments in the international financial markets. Market participants on both sides of the Atlantic revised their inflation expectations for the current and coming year upwards multiple times. Together with the assessment that the burdens resulting from the Omicron variant would be manageable, this led to some central banks making their monetary policy less accommodative. The Bank of England, for instance, responded with two Bank Rate increases, while the Fed announced in January

Financial markets shaped by mounting inflationary risks and expectations of tightened monetary policy

that it deemed it appropriate to bring net asset purchases to an end in March and to raise the federal funds rate soon. Market participants are now anticipating a less expansionary monetary policy for the euro area going forward, too. As a result, benchmark returns have increased and real interest rates have also risen. On the whole, yields on euro area corporate bonds went up significantly more strongly still than government bond yields. On balance, then, the yield spreads of corporate bonds, which are an indicator of enterprises' funding conditions, were most recently slightly above their five-year average. Amid rising interest rates, prices on the international equity markets declined, but they were predominantly in positive territory compared with the end of September. This was due, first and foremost, to an improvement in overall earnings expectations, particularly on the back of increased profit margins at large enterprises. Foreign exchange market developments were also influenced largely by the persistently high inflation rates worldwide, the measures announced by central banks to counteract these as well as those already taken, and speculation among market participants regarding further steps towards monetary policy normalisation. Measured as a weighted average against the currencies of 19 major trading partners, the euro has, on balance, depreciated by 2.1% net since the end of September.

ECB Governing Council decides to end net asset purchases under PEPP

In December 2021, the ECB Governing Council decided on a step-by-step reduction in the pace of asset purchases, whereby net asset purchases under the pandemic emergency purchase programme (PEPP) would be reduced in the first quarter of 2022 and discontinued at the end of March. At the same time, the Governing Council extended the reinvestment horizon for the PEPP to at least the end of 2024. Furthermore, it decided to conduct larger net asset purchases on a temporary basis under the asset purchase programme (APP) as of April 2022. These are set at €40 billion per month in the second quarter and €30 billion in the third quarter, before being maintained at their previ-

ous monthly pace of €20 billion from October 2022 onwards.

In February 2022, the Governing Council confirmed the decisions it had made in December. However, it also made various changes to its communication. For instance, the need for monetary policy accommodation was no longer mentioned, nor was inflation projected to settle below its target. Instead, the Governing Council stressed that inflation had risen steeply over the last few months and had also been higher than expected in January. In contrast to December, it explicitly spoke of risks to the inflation outlook being tilted to the upside, particularly in the short term. Furthermore, the Governing Council's monetary policy communication no longer ruled out an initial interest rate increase as early as this year.

ECB Governing Council sees risks to inflation outlook tilted to upside

This adjustment to the Governing Council's monetary policy communication contributed to a further rise in money market forward rates. Using these rates as a basis, it appears that market participants most recently priced in an initial interest rate hike of 10 basis points for as early as July 2022. In addition, the futures curve became far steeper, meaning that a more immediate impact of interest rate increases is also priced in. Although it can be assumed that the rise in forward rates is in large part attributable to risk premia and not to anticipated higher interest rates, market participants will probably expect interest rates to rise far earlier than they had predicted back in December. This was also backed up by the Eurosystem's monetary policy survey conducted prior to the February meeting (Survey of Monetary Analysts). Compared with the December survey, respondents' predictions of when the first interest rate hike would take place moved forwards again.

Money market forward rates rise sharply once again

The broad monetary aggregate M3 expanded significantly in the fourth quarter of 2021 as well. However, net inflows remained markedly below the high levels that were recorded in the previous year owing to the coronavirus pandemic. Monetary growth thus continued to

Further normalisation of monetary growth

normalise. Besides the Eurosystem's ongoing asset purchases, monetary growth was mainly supported by banks' lending to the domestic private sector. Looking at loans to non-financial corporations, the special conditions applicable under TLTRO-III, which are linked to a lending benchmark, resulted in considerable frontloading effects in the final quarter. At the same time, household demand for loans for house purchase remained strong. The banks responding to the Bank Lending Survey (BLS) reported that they had left credit standards for loans to enterprises and loans to households for house purchase broadly unchanged in the fourth quarter.

Distinct decline in German economic output towards end of year

Economic activity in Germany declined markedly in the fourth quarter of 2021, having shown strong growth in the third quarter. According to the Federal Statistical Office's flash estimate, real gross domestic product (GDP) shrank by 0.7% on the quarter after seasonal adjustment. It was thus still 1.5% short of its pre-crisis level recorded in the fourth quarter of 2019. Real GDP grew by 2.8% in 2021 as a whole, having fallen in 2020 as a result of the pandemic.

Resurgence of pandemic depressed services sector and private consumption; industrial production and exports up despite ongoing issue of serious supply bottlenecks

The decline in economic output in the fourth quarter of 2021 was largely due to the resurgence of the pandemic. The resulting containment measures and social and physical distancing requirements hit some services sectors hard. In addition, it appears that activity in the construction sector remained lacklustre in spite of high demand. The construction sector is experiencing a lack of labour and a major – albeit decreasing – materials shortage. By contrast, industry made a positive contribution. In the first three quarters of 2021, growing bottlenecks in the supply of intermediate goods had seen industrial production decline despite order books being very well filled. Although surveys indicated that enterprises still considered the supply problems to be severe in the fourth quarter, the increase in industrial production suggests that they eased to a certain extent. On the expenditure side of GDP, one particular

way in which the resurgence of the pandemic was reflected was a clear decline in private consumption. By contrast, investment in machinery and equipment as well as exports probably rose on the back of the positive developments.

In line with these developments, German banks substantially expanded their lending to the domestic private sector in the fourth quarter. Loans to non-financial corporations saw particularly strong growth, especially in the short-term segment. First, this was because banks upped their lending in order to qualify for the more favourable interest rate on their TLTRO-III operations. Second, production delays caused by aggregate supply bottlenecks increased enterprises' short-term financing needs. Lending to households rose sharply, too. This was due to constantly high net inflows to loans for house purchase, demand for which was bolstered by the still exceptionally favourable financing terms. Banks tightened their credit standards for loans to households for house purchase again marginally in net terms.

Strong uptick in German banks' lending to domestic private sector

The factors that curbed economic activity in the fourth quarter had barely any impact on the labour market. Employment continued to recover, and both unemployment and the use of short-time working arrangements fell substantially. Leading indicators suggest only a comparatively mild dip in the labour market in the first quarter of 2022, despite the currently high infection rates.

Labour market recovery continued in Q4

With a year-on-year increase of 1.5%, negotiated wages climbed more sharply in the fourth quarter of 2021 than in the third quarter. In line with the distinct drop-off in short-time working, actual earnings probably rose by considerably more than negotiated wages. At just 1.5% in 2021 as a whole, negotiated wages rose significantly less sharply than in the year before, chiefly owing to wage agreements being modest as a result of the pandemic.

Negotiated wages rose more sharply in Q4 than in Q3; actual earnings probably up again considerably

Small 2022 wage round in an environment of high inflation rates

This year, the rise in negotiated wage rates will still be largely influenced by the wage agreements concluded in previous years. At the time the agreements were made, there was a great deal of uncertainty surrounding the economic outlook and inflation rates were low. In this year's small wage round for roughly 8 million employees, the favourable macroeconomic outlook, increasing labour market shortages and high inflation rates could contribute to distinctly higher wage agreements.

Planned increase of general minimum wage to €12 per hour raises pressure on aggregate wages

The Federal Labour Minister is aiming to increase the statutory general minimum wage to €12 per hour from 1 October 2022. This political intervention in the wage-setting process would raise pay distinctly in the lower wage brackets as well as having a marked impact on the wage brackets above, thus presumably increasing upward pressure on aggregate wages. Based on historical relationships, the macroeconomic effects will probably be manageable. However, in the current environment of very high interest rates, a potentially stronger pass-through of wages to prices cannot be ruled out.

Inflation rate hit record level at end of 2021

Consumer price inflation continued to rise in the final quarter of 2021. On average between October and December, the Harmonised Index of Consumer Prices (HICP) went up by 1.2% on the quarter in seasonally adjusted terms. The higher inflation rate was chiefly due to energy prices, which increased even more sharply than before. Growth in prices for food, services and non-energy industrial goods remained strong, but was slightly down on the previous quarter. HICP inflation was up very significantly by 5.4% on the year, following an increase of 3.5% in the third quarter. Excluding energy and food, the inflation rate grew from 2.1% to 3.6%, thus also reaching its highest level since the euro area was established.

On an annual average, consumer prices up very considerably in 2021

At 3.2%, average consumer price inflation for 2021 increased very considerably on the year. First, the base effect of the temporary reduction in VAT rates in the second half of 2020 sig-

nificantly increased inflation rates in the corresponding period of 2021, and second, energy prices picked up substantially over the course of the year. Non-energy industrial goods and services inflation rose unexpectedly sharply, especially from mid-year onwards. This was due to high price pressures on upstream stages of the supply chain resulting from pandemic-related supply bottlenecks, increased transport costs and higher commodity prices. Given the level of demand, these were passed through to consumers.

At the beginning of 2022, the pace of growth in consumer prices increased substantially once again. Energy prices, in particular, picked up sharply owing to considerable price hikes for gas and electricity, though prices of other HICP components also continued to rise on a broad basis. Therefore, despite the elimination of the VAT base effect, in a year-on-year comparison the inflation rate declined to only a comparatively small extent from 5.7% in December to 5.1% in January. In the coming months, inflationary pressures are likely to remain high, given the considerable price increases in upstream stages of the supply chain and persistent demand.

German economic output is likely to decline again markedly in the first quarter of 2022. This is due to the resurgence of the pandemic caused by the Omicron variant. In contrast to previous waves of the pandemic, the services sector is unlikely to be the only one in which activity is being adversely affected by containment measures and social and physical distancing requirements. In fact, working hours lost due to the pandemic could also be having a distinctly dampening effect on economic output – and in other sectors, too. Nevertheless, positive effects are expected from the industrial sector. Here there are signs of a further easing of supply bottlenecks, and demand for industrial products remains high. In light of very robust demand, GDP is likely to rebound strongly in the second quarter, provided the pandemic subsidies and the supply bottlenecks continue to ease.

High price increases continued on a broad front in January

Economic output likely to decline again markedly in Q1 2022 before strongly rebounding in Q2

Government finances provided strong support to economy again in 2021; deficit again high

Last year, government finances continued to make a considerable contribution to supporting the economy during the coronavirus crisis. This was reflected above all in high expenditure, for example for transfers to enterprises and short-time working benefits. Revenue made a strong recovery, with taxes even surpassing the level that had been expected for 2021 prior to the crisis, after factoring out legislative changes implemented in the meantime. According to initial data, the deficit again amounted to just over 4% of GDP (2020: 4.3%). The debt ratio is likely to have been in the region of 70% at the end of 2021.

Deficit likely to decline significantly in 2022; government budget looks set to weather crisis well

Government finances look set to improve significantly this year. The main reason for this is the economic recovery, which should be accompanied by government economic support coming to an end. The deficit will then go back down and the debt ratio will see a decrease owing to nominal GDP growth in the ratio's denominator. It is thus likely that the government budget will weather the coronavirus crisis well. While the deficits are high for a time, this is largely due to temporary crisis-related burdens that will subside again rather quickly.

Flexible handling of debt brake considerably expands leeway for borrowing and ...

The vast majority of crisis-related burdens fall under the central government budget. The debt brake's escape clause, which is designed for use in such an emergency situation, was therefore activated for the central government budget in 2020 and 2021. In these crisis years, the deficits of the core budget amounted to nearly €350 billion in total. However, this high figure far exceeds the coronavirus-related burdens in the core budget. This is because the deficits include nearly €100 billion (2½% of GDP) in exceptional loan authorisations that were not needed and that the central government has placed in its special funds. The second 2021 supplementary budget agreed in January 2022 alone accounts for €60 billion of this amount. In January, the Bundestag also decided to exempt central government's special funds from the debt brake going forward. It is only through this measure that the authorisa-

tions contained in the special funds can be used to temporarily expand the leeway for borrowing even after the end of the pandemic emergency. These funds have been earmarked for expenditure that is not closely connected to the pandemic response.

As a result, beyond the pandemic emergency and over and above the regular debt brake limit, there is considerable additional scope for borrowing in the upcoming financial planning period. The repayment burdens associated with this are to be deferred until the period after 2027. In these later years, there will therefore be less financial leeway. All in all, the way the debt brake is being used does not appear to be in the spirit of its intention. This could potentially weaken the binding effect of the debt brake. Yet this binding effect is crucial if the debt brake is to reliably ensure sound government finances. There may be arguments for modifying the debt brake's design. Indeed, moderate deficits certainly pose no threat to the soundness of government finances, and the requirements of the debt brake are also sometimes stricter than what is prescribed under the EU a new design rules. If a new design were to take these factors into account, a transparent and stability-oriented reform of the debt brake would be the more suitable path to take.

... threatens binding effect of debt brake

A stable monetary union also depends on sound government finances. This means that effective fiscal rules are important at the European level, too. They need to have the effect of reliably lowering high debt ratios. The European rules have thus far not fulfilled this task, which means there is certainly room for improvement here. In particular, the quantitative requirements for the medium-term budgetary objective should be clearer and more binding. Even then, a stabilising and future-oriented fiscal policy would still be a possibility. Improvements in this regard would include, for example, national bad weather funds that are built up when times are good and a capped golden rule that protects government investment expenditure to an extent that it is consistent with stability.

Greater binding effect of European fiscal rules desirable

Global and European setting

Global economic developments

Global economy probably regained some momentum in Q4

Global economic growth is likely to have picked up again somewhat in the final quarter of 2021. However, economic developments were fairly different from region to region. In the United States and Japan, real gross domestic product (GDP) saw a return to strong growth due to factors limiting production easing off to a certain extent and COVID-19 cases dropping. In China, the normalisation of the power supply contributed to more dynamic growth. In Europe, by contrast, the economy was stifled by the pandemic once again. In the euro area, the upswing was significantly weakened as containment measures were tightened and consumer behaviour became more cautious again. The United Kingdom, which was one of the first industrial countries to be hit by the especially contagious Omicron variant of the coronavirus, also recorded only moderate GDP growth.

Noticeable revival in global industry

The acceleration of global economic growth was attributable not least to industry and to motor vehicle manufacturers in particular. The worldwide shortage of semiconductor components, for which there is great demand, persisted. However, the situation eased somewhat as production in South-East Asia recovered from temporary restrictions due to the pandemic. Amid the rapid spread of the Omicron variant, there is currently a risk of supply-side obstacles becoming worse again. In many areas, sickness rates climbed to record levels. Furthermore, supply chains and transport routes may have been impaired by closures of factories and ports, particularly in countries that continued to attempt to contain infections using stringent measures.

High-contact service sectors will probably be significantly less disrupted by the consequences of the spread of the Omicron variant than they

had been in previous waves of infection. Containment measures were generally tightened to just a moderate degree, or even recently relaxed, because, in many places, the Omicron variant was affecting largely vaccinated populations and symptoms were more frequently mild. However, the high case numbers mean that more people are subject to isolation and quarantine rules, hampering economic activity. Accordingly, there was a deterioration in sentiment among purchasing managers in the services sector around the world in January. Even so, judging by the experiences of other countries, the Omicron wave could subside again quickly, meaning that these burdens are likely to be quite short-lived.

Short-lived pandemic-related burdens on services sector

Against the backdrop of the increased numbers of infections, amongst other factors, the staff of the International Monetary Fund (IMF) re-

 Deutsche Bundesbank

even larger amount in order to incorporate the likely failure of major fiscal initiatives as well as the prospect of monetary policy accommodation being reversed earlier than originally announced. At the same time, the IMF now expects that higher rates of inflation in many regions of the world will persist for longer and once again warned of upside risks to the inflation outlook.

At the beginning of the year, commodity prices rose once again across the board starting from a high level. In particular, crude oil prices recently rose by a considerable amount and exceeded US\$90 per barrel for the first time since 2014. Alongside robust demand, temporary production losses and concerns surrounding continued supply tensions in the global crude oil market had an inflationary impact.² Gas prices in Europe dipped slightly at the start of January after having reached record highs in December 2021. The key factors in this context were the unusually warm weather for that time of year and significantly increased liquid natural gas imports from the United States. Due to the protracted political crisis between Russia and Ukraine, however, the cost of future gas flows became significantly more expensive, and futures contracts suggest that gas prices will remain high for the remainder of the year. Industrial commodity prices picked up considerably again, too.

Crude oil prices reach seven-year high, futures suggest persistently high gas prices

High energy prices made a substantial contribution to the renewed rise in consumer price inflation around the world. According to an initial estimate, the year-on-year rate of change in consumer prices for the industrial countries as a whole rose to 5.8% up to January. But, even defined more narrowly, i.e. excluding energy

Consumer price inflation in industrial countries rises again

IMF revises 2022 global growth forecast significantly downwards, warns of upside risks to inflation outlook

vised its global growth forecast for 2022 downwards by 0.5 percentage point to 4.4%.¹ In light of China's zero-COVID strategy and the ongoing problems in its real estate sector, the IMF reconsidered China's growth prospects to be less favourable. The IMF staff lowered its growth projection for the United States by an

¹ See International Monetary Fund (2022).
² The latter were fuelled by a number of factors, which include, for example, low inventories, missed production targets amongst OPEC countries, and geopolitical conflicts. In addition, there has been a perceptible decline in investment in production capacity over previous years, in which deterioration in the longer-term outlook for demand in light of global efforts to reduce CO₂ emissions may have played a role.

and food, consumer price inflation climbed to 4.3%, meaning that inflationary pressures had become more broadly based. This development was driven by buoyant demand coupled with high cost pressures initially resulting chiefly from price increases at the upstream production stages and for transport services. Moreover, some industrial countries were already experiencing accelerated wage growth. This holds especially true for the United States, where the labour market appears to have overheated. In the euro area, too, there are increasing signs of tensions on the labour market (see the box on pp. 15 f.). Against this backdrop, many central banks tightened their monetary policy stance or at least considered doing so.

China

Industry revival, but underlying cyclical trend remains weak

According to official estimates, real GDP in China rose by a seasonally adjusted 1.6% in the final quarter of 2021 compared with the preceding quarter, in which growth of only 0.7% was recorded.³ The main reason for the higher pace of growth was increased activity in the industrial sector, which had been adversely affected by severe power shortages in the third quarter. Industry also benefited from the ongoing boom in foreign business.⁴ The underlying cyclical trend in China remained weak, though. The downturn in the real estate market continued. The number of homes purchased and construction projects commenced once again fell significantly. Should the situation on the housing market come to a head, it could have adverse economic implications not only for China but also for other countries.⁵

Containment measures curb consumption but also inflation

Private consumption also appears to have remained lacklustre in the fourth quarter. This was partly due to the fact that the spread of the Delta variant of the coronavirus led to outbreaks in a number of cities and provinces, which resulted in strict containment measures being imposed at the local level. Dampened consumption activity is probably one reason why consumer price inflation, at 0.9% on the

Real GDP in selected major emerging market economies

Deutsche Bundesbank

year in January 2022, was very weak by international standards. The rate excluding food and energy was also low, at 1.2%.

Other selected emerging market economies

The Indian economy is likely to have continued to recover in the fourth quarter of 2021 from the consequences of the severe Delta wave in the second quarter. Economic output fell just short of pre-pandemic levels in the third quarter. There was continued strong growth in goods exports throughout the reporting period. Export revenue in US dollar terms was over one-third higher in the fourth quarter than in

Recovery continued in India

³ In a year-on-year comparison, economic growth in the final quarter stood at 4%.

⁴ With year-on-year growth of +23%, revenue from goods exports (in US dollar terms) again went up very sharply. However, price rises are also likely to have played a large part in this.

⁵ See Deutsche Bundesbank (2021a).

the same period a year earlier. However, spending on imports also went up sharply due to rising commodity prices. Meanwhile, industrial production expanded only slightly on the year, while motor vehicle production even suffered a setback. Consumer price inflation rose markedly to 6.0% in January 2022. The Indian central bank nevertheless left its policy rate at 4%.

Economy in Brazil persistently weak

In Brazil, real GDP had already returned to pre-crisis levels back in early 2021. However, it dipped back down in the second and third quarters, and it is unlikely to have experienced a revival in the fourth quarter either. Industrial production stagnated, while retail sales decreased markedly in price-adjusted terms. A major reason for the weak consumption activity is likely to have been strong inflation. Consumer price inflation increased to 10.5% in the fourth quarter and remained at a similarly high level at the start of the year. The Brazilian central bank therefore continued to tighten its monetary policy. All in all, it has raised its policy rate by 875 basis points since March 2021 to a current rate of 10.75%.

Two-speed economic development in Russia

According to preliminary government estimates, economic output in Russia increased by 4.6% in 2021 as a whole. This more than compensated for the pandemic-related losses of 2020. In the final quarter, for which no GDP figures are available yet, there appears to have been a two-speed economic development. Manufacturing output increased sharply. Revenue from energy exports also recorded renewed significant growth thanks to a sharp rise in oil and gas prices. However, the week of non-working days between the end of October and start of November ordered across the country in response to the tense pandemic situation is likely to have hit the services sectors especially hard. Up to January, consumer price inflation rose to 8.7% on the year. Given the geopolitical tensions relating to Ukraine, the start of the year saw the rouble come under intensified downward pressure. The Russian central bank has increased its policy rate in three

steps by a total of 275 basis points since the start of October to 9.5%.

United States

In the United States, the economy shifted into a higher gear in the final quarter of 2021. Preliminary estimates indicate that seasonally adjusted real GDP was up by 1.7% on the third quarter. The main reason for this good performance is that adverse factors that had stalled the upswing in the third quarter became less significant. For example, the wave of infections brought about by the Delta variant of the coronavirus continued to subside. After repairing storm damage, factories and ports on the East Coast returned to business as usual. Lastly, the automotive sector benefited from factors affecting upstream stages of production easing off to a certain extent. US firms used the overall strong increase in the supply of domestic and imported goods first and foremost to restock. By contrast, the level of investment in machinery and equipment or buildings only slightly exceeded the level of the previous quarter. Households upped their consumption expenditure only moderately, with recent purchasing power losses decreasing their propensity to purchase. Consumer price inflation continued to rise and in January reached its highest level in almost 40 years, at 7.5%. At 6.0%, the core rate, which excludes energy and food, was only slightly lower. In view of this, the US central bank indicated in January that it could soon raise its interest rates.

Strong GDP growth in Q4

It is not just due to surging inflation that the US economy will be unlikely to build much on the fourth quarter's high pace of growth at the start of 2022. The rapid spread of the highly contagious Omicron variant is putting pressure on demand for high-contact services and has already resulted in a considerable number of working hours being lost due to illness and quarantine rules. Total hours worked saw a marked decrease in January.

Pandemic-related setback at start of year

The current situation in euro area and US labour markets

As the global economy quickly bounced back from the pandemic-induced slump in spring 2020, many countries' labour markets made a brisk recovery as well, first and foremost in the United States and the euro area. So much so, in fact, that labour shortages have been on the rise again at enterprises on both sides of the Atlantic in recent months. Wage growth in the United States has already gained significant traction as a result of this, and the question is whether something similar might happen in the euro area.

There are considerable differences between the US and euro area labour markets, however. For one thing, the US labour market is far more flexible. For another, there is less intervention to stabilise employment in the United States, as developments during the coronavirus pandemic demonstrated once again. Within the space of two months in spring 2020, the US unemployment rate shot more than 11 percentage points higher, compared with a modest increase of just over 1 percentage point in the euro area. This difference will have been largely the result of comprehensive measures in the euro area aimed at preserving jobs, such as short-time working arrangements. In the United States, by contrast, households received support in the form of increased direct relief payments, while firms were given incentives to quickly hire back employees who may have been laid off. As the economy recovered, the jobless rate in the United States was already almost back at its pre-crisis level at the end of 2021.¹ In the euro area, meanwhile, it even dropped noticeably below its level before the onset of the crisis (which was admittedly substantially higher).

Labour demand in both the US and the euro area has remained exceptionally brisk ever since, with firms finding it increasingly difficult to fill vacancies. The number of unfilled positions in the euro area climbed to an all-time high in the third quarter of 2021. Business survey findings indicate that the situation may have deteriorated further still in the meantime, with the share of firms reporting labour shortages peaking in the first quarter of 2022 in both industry and services sectors.

¹ It thus also fell short of widely used estimates of the natural rate of unemployment and the long-term level expected by members of the US Fed's Federal Open Market Committee (FOMC). The decline in the unemployment rate came to a halt in January 2022 due to a resurgence of pandemic-related challenges.

Deutsche Bundesbank

Tense as the situation in the euro area may be, matters are worse still in the United States, where job vacancy figures actually exceeded the number of people seeking work recently. This will undoubtedly be due in part to the US economy's particularly brisk and robust recovery.² But not even in earlier boom periods has labour demand in the United States exceeded supply on this scale. This is clearly shown by shifts in the Beveridge curve, which captures the relationship between the unemployment rate and the job vacancy rate. Labour force participation, which contracted as the crisis unfolded and remains depressed, appears to be a notable factor holding back employment growth.³ The euro area was more successful in keeping people in the labour market, which goes some way towards explaining why labour shortages are less pressing here than they are in the United States.

The different degrees of labour market slack are reflected in wage developments as well. Wage growth has already gained considerable traction in the United States, with the strong increases in wages particularly benefiting workers in high-contact services sectors initially before spreading to other in-

dustries.⁴ The euro area likewise saw wage growth pick up somewhat of late, albeit at a flatter pace so far than immediately prior to the pandemic.⁵ Looking ahead, wage growth will probably accelerate appreciably in the euro area as well, particularly in light of the strong consumer price inflation, but increases are unlikely to be as noticeable as in the United States owing to the differences outlined above.

2 In the United States, real gross domestic product was already above its pre-crisis level in spring 2021, whilst in the euro area, the level immediately prior to the crisis was only reached six months later. Deutsche Bundesbank (2021b) provides background on why the US and euro area economies have fared differently since the onset of the pandemic.

3 US labour force participation did not make a full recovery for a number of possible reasons: the very generous income support programmes during the pandemic, concerns about becoming infected with the coronavirus, the increased demands placed on families (in particular on mothers of younger children), and older workers withdrawing early from the labour force. Sectoral shifts induced by the pandemic may also have led to an increase in the mismatch between job requirements and job seeker profiles. These factors are discussed in Pizzinelli and Shibata (2022), for example.

4 Projections based on modified Phillips curves that include, amongst other things, the job vacancy rate as a measure of the degree of slack in the labour market imply that US wage growth could actually gain even more pace over the next two years. See Domash and Summers (2022).

5 The different labour market responses to the pandemic partly explain the divergent growth rates of average wages in the United States and the euro area in 2020. In the United States, it was particularly people with low incomes who were affected by layoffs, which is why average gross wages per employee increased significantly initially before subsiding again to a degree as workers were rehired. Average gross wages per employee in the euro area, by contrast, fell significantly at first because many employees switched to short-time work schemes. The analysis of wage changes on the penultimate year disregards short-term compositional effects attributable to the crisis.

Japan

Recovery after pandemic-related setback

In Japan, the road to recovery remained bumpy. According to the initial official estimate, in the fourth quarter real GDP rose by a seasonally adjusted 1.3% on the previous quarter, in which it had contracted markedly. Private consumption expanded steeply on the back of a receding number of COVID-19 cases and a relaxation of containment measures. Motor vehicle production also picked up again following a slight easing of supply bottlenecks for semiconductors. Business investment likewise expanded somewhat as a result. Exports rose markedly, driven by an increase in foreign sales of motor vehicles. By contrast, imports recorded a slight decline. Labour market conditions continued to improve and the seasonally adjusted unemployment rate fell to 2.7%. In the current quarter, the spread of the Omicron variant is likely to again dampen economic activity. Furthermore, a resurgence of supply bottlenecks is constraining production in the manufacturing sector. In the first few months of the year, a number of motor vehicle manufacturers again idled production. The year-on-year rate of the consumer price index (CPI) fell to 0.5% in January as a result of base effects.⁶ The Bank of Japan recently revised its inflation forecast for the coming fiscal year upwards and now forecasts price risks to be balanced rather than tilted to the downside.

United Kingdom

Moderate economic expansion

In the United Kingdom, the overall economic upturn continued, maintaining its moderate pace in the final quarter of 2021. According to the preliminary estimate, real GDP increased by 1.0% on the quarter after seasonal adjustment and was just short of its pre-crisis level. The services sector was again the driving force behind this growth. High-contact service sectors, such as hotel and restaurant services as well as wholesale and retail trade, suffered a marked dampening towards the end of the year due to the spread of the Omicron variant. However,

Real GDP in selected industrial countries

Q4 2019 = 100, seasonally and calendar adjusted, log scale

Sources: Bureau of Economic Analysis, Cabinet Office of Japan, Office for National Statistics, Statistics Poland and Bundesbank calculations.
 Deutsche Bundesbank

activity was up significantly in the health and social services sector, boosted by the increase in testing and vaccinations in December. Furthermore, providers of transport services benefited from the increased use of online shopping during the Christmas shopping season. By contrast, a shortage of materials continued to weigh on operations in the manufacturing sector and production stagnated. The construction sector, which is facing a severe shortage of staff, saw only a slight pick-up in activity. In spite of the UK Coronavirus Job Retention Scheme coming to an end on 30 September 2021, the unemployment rate has since continued to fall and now stands at 4.1%. At the same time, the number of reported vacancies reached an all-time high. The tight labour mar-

⁶ The considerable reduction in mobile phone charges also continues to have a dampening effect here. Since a reform of mobile phone charges in April 2021, they had declined by 48% by January. In January, this one-off effect pushed down the year-on-year rate of the CPI by 1.5 percentage points.

ket situation was also reflected in persistently robust wage growth. The acceleration of wage growth is adding to general cost pressure and could fuel consumer price inflation even further. The year-on-year rate of the Harmonised Index of Consumer Prices (HICP) rose to 5.5% in January. As a result, the Bank of England raised its policy rate by 40 basis points to 0.5%. It believes that some further modest tightening in monetary policy is likely to be appropriate in the coming months.

Poland

*Strong growth,
significant
inflation*

Despite another sharp wave of the pandemic, Poland's upturn continued unabated in the final quarter, in which real GDP grew by 1.7% after seasonal adjustment. This was notably attributable to a sharp increase in industrial production. Retail sales likewise rose considerably in price-adjusted terms. In December, the unemployment rate fell to 2.9%, thus returning to its historically low level from March 2020. Initial estimates put growth in the Polish economy at 5.7% for full-year 2021. However, the strong upswing has also meant a significant rise in inflation. The rate of consumer price increase accelerated to 8.6% on the year in December, with the energy component accounting for a substantial portion of this. Yet, even excluding energy and food, consumer prices were still up by 5.3%. Consumer price inflation intensified even further in January, rising to 9.2%. As a result, the Polish central bank has raised its policy rate in three further increments since December, by a total of 150 basis points to 2.75%. The Polish government also instigated measures to curb prices, lowering VAT on gas and electricity for three months and fuel taxes for five months. As of February, VAT on food is to be cut to 0% for five months.

Macroeconomic trends in the euro area

In the euro area, the economic recovery came to a near-standstill towards the end of 2021. According to Eurostat's flash estimate, real GDP rose by just 0.3% on the preceding quarter after price and seasonal adjustment. A key reason for this was a renewed flare-up of the coronavirus pandemic, which led to containment measures being temporarily tightened, significantly so in some cases. This had a particular impact on accommodation and food service activities as well as various other services, and dampened private consumption. The sharply rising prices for energy and intermediate products increased enterprises' production costs and resulted in considerable price increases that were passed through to consumers. This eroded households' purchasing power. According to the EU survey, the supply bottlenecks that had previously impaired the activities of industrial enterprises continued to spread, but their intensity is likely to have dropped off somewhat. In any case, there was a noticeable increase in motor vehicle production, which had suffered in particular measure under the effects of the semiconductor shortage.

*Recovery comes
to near-standstill
at end of 2021*

In total, euro area GDP rose by 5.2% in 2021 after having fallen by 6.5% in 2020 due to the pandemic. The pre-crisis GDP level was reattained towards the end of the year.

*Pre-crisis level
re-attained*

In the eastern euro area Member States, the pandemic situation had already deteriorated towards the end of the third quarter. Subsequently, the Delta variant of the coronavirus also increasingly spread throughout the more western Member States. In these countries, however, this wave of infections was considerably less pronounced. Higher vaccination rates are likely to have been one reason for this. There were significant differences in the responses to this wave of the pandemic from country to country. While some individual countries temporarily reimposed very stringent

*Pandemic
situation more
tense again, but
measures tight-
ened only to
limited extent*

containment measures (including Austria and the Netherlands), other countries tightened their restrictions only to a limited extent. Towards the end of the quarter, the spread of the Omicron variant caused the number of infections to rise to record highs. Although containment measures were tightened somewhat again, more substantial economic losses were likely to have arisen from temporary losses of work due to illness and quarantine as well as from changes in behaviour.

Private consumption shifts down a gear

It appears that private consumption did not rise further in the fourth quarter after seeing strong growth in the third quarter. Although retail sales rose somewhat again in price-adjusted terms, new vehicle registrations continued to decline, probably in part due to delivery difficulties among motor vehicle manufacturers. The reasons for the slowdown in private consumption are likely to have been factors related to the wave of infections such as access restrictions, reduced opening hours and capacity restrictions. In this context, demand for recreation and leisure services, which had seen strong growth in the third quarter, experienced a renewed decline. In addition, the considerable rise in the costs of living led to a noticeable reduction in consumers' purchasing power.

Investment remains on upward trajectory

By contrast, gross fixed capital formation is likely to have risen in the fourth quarter.⁷ This holds especially true for investment in information and communication technologies as well as investment in intellectual property, which appear to have recorded strong expansion once again. Construction investment appears to have remained subdued. In any case, there was no increase in construction work. It is also likely that purchases of transport equipment only saw little growth. The numbers of commercial vehicle registrations fell once again, probably due in part to delivery difficulties among motor vehicle manufacturers. By contrast, spending on other machinery and equipment is likely to have risen. In October and November, capital goods producers' domestic

 Deutsche Bundesbank

sales markedly exceeded the previous quarter's level after price adjustment.

Goods exports to third countries likely rose somewhat in price-adjusted terms. Based on value, goods exports even rose by a very significant degree due to large rises in prices. In regional terms, the recovery in exports to the United Kingdom continued. Goods exports to the United States saw strong growth. Follow-

Goods trade with third countries sees strong growth with rising prices

⁷ Excluding Ireland. For several years now, the statistical recording of investment as a whole, and of investment in intellectual property in particular, has been strongly influenced by the strategic planning of multinational enterprises in that country. See Deutsche Bundesbank (2018).

 Deutsche Bundesbank

ing a weak preceding quarter, exports to China rose again somewhat. According to figures from the balance of payments, services exports from the euro area to third countries grew to a remarkable extent, driven largely by the ongoing recovery in tourism. Goods imports to the euro area from third countries also rose to a considerable extent, both in price-adjusted terms as well as by value. The distinct rise in imports of intermediate products suggests that supply bottlenecks are easing slightly.

Brighter situation in manufacturing due to slight easing of materials shortages

The situation in manufacturing brightened up in the fourth quarter. Although the industrial production index fell markedly compared with the preceding quarter, this was the result of one-off developments in Ireland and in the pharmaceutical sector. In particular, motor vehicle production saw noticeable growth, which was probably attributable chiefly to an improvement in the supply of semiconductors. Nevertheless, materials shortages continued to stifle economic activity. Another dampening

factor was the sharp increases in prices for energy and intermediate products. Consequently, there was also a rise in the producer prices of capital goods and consumer goods. According to surveys, the number of orders on hand remained favourable through to the end of the year. There was also hardly any change in capacity utilisation, which slightly exceeded its long-term average.

In the fourth quarter, activity in various services sectors declined again somewhat as a result of the pandemic; particularly affected were hotel and restaurant services as well as art and cultural activities. Nevertheless, the level of activity was considerably higher than in the previous year. By contrast, economic activity is likely to have risen further in a number of commercial services sectors. The strong upswing in the information and communications sector continued.

Interruption in recovery among service providers

Economic dynamics weakened considerably towards the end of the year in most euro area Member States. However, there were differences depending on the extent to which each country was affected by the latest wave of infections, the progress made in their vaccination campaigns, and the containment measures taken. Differences in their economic structures as well as their progress in the recovery process also played a role.

Weaker dynamics in all Member States

In France, GDP growth slowed to 0.7% in the fourth quarter. This meant that it had already slightly exceeded its pre-crisis GDP level. Following the very large rise in the third quarter, which was largely due to catch-up effects, private consumption recorded moderate growth once again. In light of the fact that the number of infections had remained subdued over a long period of time, revenues in the hotel and restaurant services sector continued to grow and have since reattained their pre-crisis level. An additional reason for the persistently good consumption activity is likely to have been the government financial assistance that was used to mitigate the effects of rising energy prices

French economic output already exceeds pre-crisis level

on individuals with lower incomes.⁸ Following a pause, investment activities were expanded markedly, driven solely by investment in intellectual property. By contrast, expenditure for construction stagnated, and investment in machinery and equipment declined considerably once again. However, there was a distinct rise in external trade. Services exports continued to benefit from the recovery in tourism, and goods exports also recorded significant growth.

sales in the accommodation and food service activities sector remained around 10% below their pre-crisis level. Investment activities also saw perceptible growth. Construction investment rose again for the first time since the end of 2020. By contrast, there was a decline in private consumption. A reason for this is likely to have been the loss of purchasing power resulting from the sharp increase in energy prices.⁹

Slowdown in economic recovery in Italy

In Italy, the overall economic recovery slowed down considerably towards the end of the year. Based on preliminary figures, real GDP increased by 0.6% in the fourth quarter and thus fell short of its pre-crisis level by 0.5%. Services sectors, which had recorded strong expansion in the second and third quarters, are likely to have lost momentum in particular. While tourism made further progress towards normalisation, it did not achieve this in full. According to the most recent figures, retail sales only saw marginal growth in price-adjusted terms. Production in the manufacturing sector, which had already noticeably exceeded pre-crisis levels, is likely to have expanded further. Most recently, however, there was a significant rise in the number of enterprises reporting factors limiting production. The upswing in the construction sector continued. On the expenditure side, goods exports and gross fixed capital formation are likely to have increased markedly. Private consumption expenditure is likely to have seen only little growth in real terms, meaning that hardly any progress was made in closing the considerable gap to its pre-crisis level.

In the autumn, economic output also rose in most other Member States as well. The rise was especially pronounced in Portugal. By contrast, Belgium, Slovakia and Lithuania posted only little growth in GDP. More substantial declines were seen in Germany and Austria; in the case of the latter, this was probably due to the drastic measures that were implemented to contain the pandemic. In the Netherlands, economic output continued to grow despite the temporary, comprehensive restrictions. In Latvia, output fell only to a marginal degree.

Noticeable heterogeneity amongst other Member States as well

The situation on the labour market continued to improve. The unemployment rate fell further and stood at 7.0% in December, which represented the lowest rate since the start of monetary union. The number of persons in employment rose to a lesser extent than in the previous quarter, but exceeded its pre-crisis level for the first time. The number of hours worked is also likely to have risen, but probably fell short of its pre-crisis level. These favourable developments were chiefly attributable to the strong demand for labour (see the box on pp. 15 f.). Furthermore, job retention schemes are still in effect in some countries, and the number of employees in the public sector has grown by 1 million since the outbreak of the crisis. This is

Labour market situation remains favourable

Spanish recovery continues

The economic recovery in Spain, which is lagging behind that of other major euro area countries, continued largely unhindered. According to preliminary estimates, aggregate output increased in the fourth quarter by 2.0% from the preceding quarter. Nevertheless, it still fell short of its pre-crisis level by 4%. A key driver of the recovery was tourism. In light of the relatively calm situation with regard to the pandemic, the tourism season was able to be extended well into the fourth quarter. However,

⁸ In October, the French government approved a one-off “inflation payout” of €100 to each person with a monthly net income of less than €2,000. The payments were disbursed in December. Furthermore, households that were already receiving financial support for energy costs were given an additional payment of €100.

⁹ In Spain, energy prices rose by 38% over the previous quarter in the fourth quarter. This was considerably sharper than the rise recorded in the euro area as a whole, which amounted to 26%.

Contributions of selected components to HICP sub-aggregates in the euro area*

Deutsche Bundesbank

also likely to have contributed to the labour shortage, about which complaints are becoming increasingly vocal. Looking ahead, all of these factors, in conjunction with higher inflation, are likely to considerably increase pressure on wages.

The rise in consumer prices in the euro area intensified to an exceptionally strong degree in the fourth quarter of 2021. As measured by the HICP, prices increased by 1.5% compared with the previous quarter after seasonal adjustment. Energy prices recorded an especially sharp increase, rising by 9.1%. However, this intensification of inflationary pressures also comprised other categories of goods. As a result, annual HICP inflation jumped from 2.8% in the third quarter to 4.6%, while the rate excluding energy and food climbed from 1.4% to 2.4%.

Consumer price inflation intensifies significantly in Q4

The rise in inflation in 2021 was broadly based. Major reasons were the considerable increase in crude oil prices and the sharp rise in wholesale prices for gas. Despite government intervention, consumer prices for gas rose by 26% on the year in the fourth quarter. For electricity, for which peak loads are often provided by gas facilities, prices increased by 19%. Fuel prices were up by 29%. Prices for food products also rose by 2.5% on the year, most recently as a result of sharp rises in the wholesale prices of meat and cereal products. For services, inflation rose to 2.4%. In this context, a key role was played by price rises in high-contact services. These include, in particular, transport, travel, accommodation and food service activities. Inflation for non-energy industrial goods also continued to rise significantly, reaching 2.4%. It was mainly new and used cars, furniture, clothing and hygiene and wellness products that saw prices go up steeply. The reasons for this were strong inflation for intermediate goods, increased transport costs, as well as ongoing delivery bottlenecks against strong demand at the same time.

Broad-based inflationary pressures across all components

Average euro area inflation for 2021 stood at 2.6%, following a rate of just 0.3% in the pre-

vious year. This shift was due primarily to energy prices, which, after a decline of almost 7% in 2020, rose by 13% in 2021. However, the rate excluding energy and food also doubled from 0.7% to 1.5%. This was attributable to increased inflationary pressures for both industrial goods as well as high-contact services.

Inflation rate rises further in January

According to Eurostat's flash estimate, the annual HICP rate grew to 5.1% in January 2022. The expiration of baseline effects should have considerably dampened inflation; however, this was instead overcompensated by larger increases in prices for energy and food. Only the rate excluding energy and food declined slightly from 2.6% to 2.3%. This was mainly due to the prices of non-energy industrial goods, with special factors regarding the timing of seasonal sales in 2021 playing a role.

Pandemic a drag on economic activity at start of year, too

In the first quarter, the Omicron wave is likely to stifle the economic upturn to a large extent; this is due less to additional administrative restrictions and more to expected labour losses resulting from illness and quarantine rules. Although enterprises know how to manage these absences, it is not possible to fully rule out supply constraints. In addition, consumer sentiment has become more subdued. Alongside the wave of infections, the greater rises in prices are likely to be a key reason for this. Once this wave of infections has abated, the underlying expansionary forces should have a

stronger impact again. The numbers of orders on hand in the industrial and construction sectors remain favourable, and households' demand for services should normalise quickly. A similar picture is also obtained from business surveys. However, increased rises in costs and prices as well as the slow resolution of shortages are cause for concern.

Monetary policy and banking business

Monetary policy and money market developments

ECB Governing Council decides to discontinue PEPP net purchases and boost APP envelope

In December 2021, the Governing Council of the ECB approved a step-by-step reduction in the pace of asset purchases for the coming quarters, with net purchases under the pandemic emergency purchase programme (PEPP) being discontinued at the end of March 2022. Furthermore, the Governing Council expects to conduct net purchases under the PEPP in the first quarter of 2022 at a lower pace than in the previous quarter. At the same time, it decided to temporarily step up net purchases under the asset purchase programme (APP) as of April 2022. These are set at €40 billion per month in the second quarter and €30 billion per month in the third quarter. As of October 2022, net purchases under the APP are to resume a monthly pace of €20 billion. This will apply for as long as necessary to reinforce the accommodative impact of the key interest rates. The Governing Council still expects net purchases to end shortly before it starts raising the key ECB interest rates.

ECB Governing Council extends reinvestment horizon for PEPP

Moreover, the ECB Governing Council decided to extend the reinvestment horizon for the PEPP. It now intends to reinvest the principal payments from maturing securities purchased under the PEPP until at least the end of 2024. It previously expected to do so until the end of 2023. In any case, the future roll-off of the PEPP portfolio will be managed to avoid interference with the appropriate monetary policy stance. In the event of renewed market fragmentation related to the pandemic, these reinvestments can be adjusted flexibly across time, asset classes and jurisdictions at any time. This could include purchasing bonds issued by the Hellenic Republic over and above rollovers of redemptions.

The ECB Governing Council left its policy rates and the associated forward guidance un-

changed. It also expects the special terms and conditions under the third series of targeted longer-term refinancing operations (TLTRO-III) to come to an end in June 2022. Nevertheless, the ECB Governing Council will continue to monitor bank funding conditions and ensure that the maturing of TLTRO-III operations does not hamper the smooth transmission of monetary policy.

Key interest rates and forward guidance unchanged

The decisions in December were taken against the backdrop of increased uncertainty surrounding the inflation outlook. In the December forecast, Eurosystem staff had revised their inflation forecast for 2022 strongly upwards again. At the same time, they still projected that inflation would settle below the 2% target over the projection horizon. The ECB Governing Council believes that monetary accommodation was still needed for inflation to stabilise at 2% over the medium term. However, in light of this uncertainty, it stressed the importance of flexibility and optionality in the conduct of monetary policy. The ECB Governing Council signalled its readiness to adjust all of its instruments as appropriate and in either direction.

ECB Governing Council stresses flexibility and optionality

Money market management and liquidity needs

In the period under review from November 2021 to February 2022,¹ excess liquidity in the Eurosystem fell by a total of €0.2 billion to an average of €4,391.1 billion. Excess liquidity initially rose in the seventh reserve maintenance period of 2021 (November-December) by €42.8 billion to €4,434.1 billion. However, the subsequent decline of €43.0 billion in the eighth reserve maintenance period of 2021 (December 2021-February 2022) fully reversed the previous increase. This development was due, on the one hand, to lower volumes of liquidity-providing asset purchases and, on the other hand, to a stronger increase in liquidity-absorbing autonomous factors in the eighth versus the seventh reserve maintenance period of 2021. Both developments are commonly observed at the turn of the year, which fell during the reporting period.

Additional central bank liquidity was provided primarily through a total of €237.9 billion worth of net asset purchases conducted as

part of the purchase programmes. The majority of these purchases were attributable to the pandemic emergency purchase programme (PEPP). As at 11 February 2022, the balance sheet holdings of the asset purchase programmes amounted to €4,820.2 billion (see the table on p. 27). By contrast, the average outstanding tender volume in the euro area decreased by €8.3 billion to €2,201.8 billion during the period under review. Although the allotment volume for the tenth operation in the third series of targeted longer-term refinancing operations (TLTRO-III) in December stood at €52.0 billion, a total of €60.2 billion was repaid from the first to the sixth TLTRO-III operations under the voluntary early repayment option, leading to a net absorption of liquidity for the TLTROs. At €1.1 billion in total,

there was little demand for the eleventh pandemic emergency longer-term refinancing operation (PELTRO) in December 2021 (previous operation in September 2021: €1.3 billion). Uptake of the regular main refinancing operations and three-month tenders likewise remained very subdued. In Germany, the outstanding volume of all refinancing operations fell by €17.3 billion to an average of €421.9 billion. As a result, German banks' share of the outstanding tender volume in the Eurosystem came to around 19.2%.

In the eighth reserve maintenance period of 2021, liquidity needs stemming from autonomous factors rose by €228.1 billion compared with the sixth reserve maintenance period of 2021, reaching a new record high of €2,405.5 billion (see the table on p. 26).² This was primarily attributable to the usual increases in the balances of non-euro area central banks at the end of the year. Another liquidity-absorbing effect was caused by the volume of banknotes in circulation rising by €33.2 billion to €1,540.6 billion. By contrast, a decrease in government deposits of €89.3 billion to €582.0 billion provided more liquidity. Germany accounted for 59% of the total increase in the balances of non-euro area central banks, which had a liquidity-absorbing effect in the other factors category. Net banknote issuance in Germany went up by €19.9 billion to €883.7 billion. The decrease in government deposits of €12.1 billion to €205.6 billion provided more liquidity in Germany, too. Over the reporting period, the minimum reserve requirement in the Eurosystem climbed by €2.6 billion to €155.4 billion in the December 2021-February 2022 maintenance period, which led to an additional need for central bank liquidity. In Germany the reserve requirement went up by €0.8 billion to €42.5 billion.

At over 99%, utilisation of exemption allowances under the two-tier system for remunerating excess reserve holdings remained virtually unchanged for both the euro area and Germany in the period under review. While excess liquidity remained roughly the same at €4,400 billion and the absolute exemption al-

lowance increased, there was a decline in excess liquidity holdings remunerated at -0.50% (see the chart on p. 28). As a result, 21.1% of the excess liquidity in the Eurosystem was exempt from negative remuneration on average in the eighth reserve maintenance period of 2021, which was 0.4 percentage point more than in the previous maintenance period (in Germany: 20.9%, previous period: 20.3%).

During the period under review, overnight rates in the euro money market remained

² Average of the eighth reserve maintenance period of 2021 (December 2021-February 2022) compared with the average of the sixth reserve maintenance period of 2021 (September-November).

Deposit facility rate, money market rates and excess liquidity

 Deutsche Bundesbank

close to the deposit facility rate of -0.50% (see the adjacent chart), except as at 31 December 2021. However, the high level of excess liquidity led to a further drop in overnight rates. In the eighth reserve maintenance period of 2021, the unsecured euro short-term rate (€STR) was set at -0.58% on average and was therefore 1 basis point lower than in the previous period. The €STR fell by 1 basis point to -0.59% as at 31 December 2021. On the following day, the €STR returned to its previous level, which it maintained until the end of the reserve maintenance period on 8 February 2022 without any major fluctuations. Average daily turnover dropped from €51.2 billion to €49.6 billion compared with the previous period, influenced by lower levels

of liquidity on public holidays and the last day of the year. However, the volumes recorded in the reporting period were higher than the volume from the sixth reserve maintenance period (September-November 2021) of €48.5 billion. On the GC Pooling trading platform, overnight trades in the ECB basket were executed at -0.56% on average in the eighth reserve maintenance period of 2021, compared with -0.57% (seventh period) and -0.55% (sixth period). At the end of 2021, no trades were executed in the ECB basket on the trading days of 29 and 31 December. In the ECB EXTended basket, which has a broader selection of securities with lower rating requirements for concluding repo transactions, overnight trading was carried out at a rate of -0.56% on average in the eighth reserve maintenance period of 2021 and thus 5 basis points below the rate of the previous period. The clear difference between the interest rate levels in the current and previous periods stemmed from the sharp decline of 137 basis points to -1.93% on 31 December. Without this year-end effect, the average interest rate in the ECB EXTended basket would have been -0.52% and thus only 1 basis point lower than in the seventh reserve maintenance period of 2021. As in the preceding period, the vast majority of overnight transactions were also accounted for by the ECB EXTended basket in the eighth reserve maintenance period of 2021, with an average turnover of €2.3 billion per day compared with €0.7 billion in the ECB basket. Liquidity-driven secured turnover on the GC Pooling platform therefore remained very low. This meant that providers of liquidity continued to refrain from using higher-quality collateral from the ECB basket in transactions, which reflected the generally limited availability of this type of collateral in the market during the period under review.

ECB Governing Council sees risks to inflation outlook tilted to upside in February

In February 2022, the ECB Governing Council confirmed the decisions it had made in December 2021. However, it did make various changes to its communication. For instance, the need for monetary policy accommodation was no longer mentioned, nor was inflation projected to settle below its target. Instead, the Governing Council stressed that inflation had risen steeply over the last few months and had also been higher than expected in January. In contrast to December, it explicitly spoke of risks to the inflation outlook being tilted to the upside, particularly in the near term. In view of the current uncertainty, flexibility and optionality in conducting monetary policy need to be maintained more than ever. Moreover, monetary policy communication did not repeat the statement that key interest rates are unlikely to be raised this year.

The APP holdings recorded on the balance sheet have risen by €53.6 billion since mid-November. On 11 February, the stock of APP

assets held by the Eurosystem reached a total of €3,154.0 billion (a breakdown of these holdings by individual asset purchase programme can be found on pp. 26 ff.). The reported holdings continue to be influenced by the smoothing over time of reinvestments in line with the technical parameters agreed upon in December 2018 and by the use of amortised cost accounting.¹ Securities holdings reported under the PEPP amounted to €1,658.5 billion on 11 February, up by €157.1 billion.

The tenth and last operation of the TLTRO-III series was settled on 22 December 2021, with 159 banks taking up a total of €52.0 billion. At the same time, there were voluntary repayments of funds provided under earlier TLTRO-III operations in the amount of €60.2 billion. Overall, a combined volume of €2,198.0 billion

APP and PEPP securities holdings recorded on balance sheet continue to grow

Final TLTRO-III sees banks take up €52 billion

¹ In particular, the difference between the acquisition and redemption value is amortised over the security's residual maturity, treated as part of interest income and measured at amortised cost.

is thus outstanding for all TLTRO-III operations. In December, uptake of the pandemic emergency longer-term refinancing operation (PELTRO), which was also the last operation of its kind, was once again very low at €1.1 billion.

Further rise in excess liquidity

Excess liquidity saw a temporary marked decline at the end of December on account of the usual year-end effects. Overall, however, it continued to rise owing to the ongoing net asset purchases under the APP and PEPP (see the box on pp. 26 ff.). As this report went to press, the volume of excess liquidity stood at €4,530.6 billion, which corresponds to an increase of around €82.1 billion since mid-November.

Short-term market interest rates fluctuate at year-end

On 3 January 2022, the publication of EONIA was discontinued as planned following a transition period. Since October 2019, EONIA had only been computed by applying a fixed spread to the euro short-term rate (€STR). In future, €STR will thus be the unsecured benchmark interest rate for the short-term money market in the euro area. Short-term money market interest rates fluctuated somewhat more strongly in December and at the turn of the year than is usually the case for that time of year. €STR fell to -0.59% at the end of the year and stood at -0.58% as this report went to press. The three-month EURIBOR declined much more sharply as early as mid-December and fell to as low as -0.61% for a time. As this report went to press, it was at -0.53% and thus slightly above its level in November.

Money market forward rates up sharply once again

Money market forward rates have risen sharply again in the wake of the monetary policy meeting in December. Using these rates as a basis, it appears that market participants most recently priced in an initial interest rate hike of 10 basis points for as early as July 2022. In addition, the futures curve became considerably steeper, meaning that a faster pace of rate hikes is also priced in. Although it can still be assumed that the rise in forward rates is in large part attributable to risk premia and not to expectations of higher interest rates, market participants will probably expect rate hikes significantly earlier

than they had anticipated back in December. This was also backed up by the Eurosystem's monetary policy survey (Survey of Monetary Analysts) conducted prior to the February meeting. Compared with the December survey, respondents' predictions regarding when the first interest rate hike would take place moved forwards again. It is now expected in the third quarter of 2023. One reason for the change in market participants' expectations was the waning concerns about the economic impact of the wave of infections with the Omicron variant of the coronavirus. Another reason was that some large central banks began to tighten their monetary policy stance or announced that they would soon tighten their stance. The significant unexpected upside developments in euro area inflation again as well as the change in the ECB Governing Council's communication led to further rises in forward rates recently.

Monetary developments in the euro area

The broad monetary aggregate M3 also recorded considerable net inflows in the fourth quarter of 2021, which, on the whole, were slightly above the inflows in the three preceding quarters. Nevertheless, it remained significantly below the high build-up caused by the coronavirus pandemic in 2020. The annual growth rate of M3 decreased again as a result and stood at 6.9% at the end of the year. One reason behind this monetary growth was the Eurosystem's ongoing asset purchases. Another was that banks' lending to the domestic private sector also accelerated significantly, which was mainly attributable to the sharp rise in lending to non-financial corporations. In this respect, the TLTRO-III requirements for obtaining the special interest rate conditions granted by the Eurosystem, which are coupled to lending growth, resulted in considerable frontloading effects. At the same time, households' demand for loans for house purchase remained high, bolstered by the persistently low general level of interest rates.

Further normalisation of monetary growth

Accumulation of overnight deposits slackened

Among the components of M3, overnight deposits once again contributed the most to the build-up in the monetary aggregate in the fourth quarter. That said, its expansion slowed significantly compared with the preceding quarters, reaching its lowest value since the outbreak of the coronavirus pandemic. Other forms of short-term deposits increased somewhat in importance, especially time deposits, as did money market fund shares in certain countries.

Households recorded lower inflows to short-term deposits ...

The contrasting developments that occurred in individual sectors were striking again. For example, the inflow to households' short-term deposits diminished again considerably. This continued slowdown is probably attributable to the generally improved consumption options that, on the whole, led to a decline in the savings ratio despite the pandemic wave that flared up at the beginning of the first quarter. Furthermore, the increase in the real opportunity costs of holding money following the rise in the inflation rate is likely to have boosted this development.

... whilst enterprises saw considerable increase, especially in overnight deposits

By contrast, non-financial corporations expanded their deposits considerably again in the fourth quarter, especially their overnight deposits. This development first reflects the continued high profit margins in parts of the corporate sector. Second, enterprises have had to postpone investment on account of persistent bottlenecks in the supply of intermediate goods, which means that the outflow of funds was again lower in parts of the corporate sector, as it had been in the preceding quarter.

Build-up of securitised lending mainly driven by Eurosystem net purchases

On the counterparts side, monetary growth was driven by the sharp increase in lending to domestic non-banks. Inflows to securities-based lending to general government were again high (see the upper chart on p. 33). These are primarily due to the monthly net purchases of government bonds by the Eurosystem under the PEPP and APP. Moreover, commercial banks also upped their holdings of bonds issued by the public sector. In addition,

lending to the domestic private sector increased sharply in the fourth quarter.²

Strong growth in lending to non-financial corporations at year-end ...

After adjustment for loan sales and securitisation, banks' lending to non-financial corporations was unusually high, having risen in the fourth quarter of 2021 at a similar rate as at the beginning of the coronavirus pandemic on balance (see the lower chart on p. 33). This rise was spread broadly across Member States and maturities, although growth was especially strong for short-term loans. The annual growth rate, which had fallen to 1.9% at the end of June 2021 on account of a strong coronavirus baseline effect, thus returned to a level of 4.2% as at the end of the year.

... underpinned by TLTRO-III provisions

Although bank lending to enterprises had already regained momentum since mid-2021, the very strong inflow at the end of the year was attributable to a one-off factor linked to TLTRO-III, which was that one of the reference periods for credit growth connected to these operations expired at the end of December. It was this reference period that determined whether banks participating in the TLTRO-III series would have access to extremely favourable refinancing conditions in the period between June 2021 and June 2022. For this reason, banks with previously weak lending records were particularly interested in frontloading their lending

into the fourth quarter of 2021 or in granting more short-term loans. One indication of this is the fact that the (already very low) short-term lending rates clearly dropped at the same time in some euro area countries. Correspondingly, lending business is likely to be lower in the first quarter of 2022. A similar pattern could also be observed in March 2021, when the last reference period came to a close.

The high demand for short-term loans from non-financial corporations can be explained by shortages in materials and labour, especially in construction and industry, which are currently driving up enterprises' inventory and operating costs. Long-term loans, too, continued to be in demand, albeit to a considerably weaker extent than in the first half of 2021. This stems from the fact that aggregate supply bottlenecks continued to cloud the investment climate in the fourth quarter.

Aggregate supply bottlenecks affect demand for credit

In the context of the Bank Lending Survey (BLS), the responding bank managers likewise noted an increase in loan demand. According

² In the quarter under review, some of these loans were securitised by banks and removed from the banks' balance sheets. The banks acquired larger volumes of securitised loans at the same time, which was reflected by the rise in their securities-based lending to financial vehicle corporations engaged in the securitisation sector.

BLS banks left credit standards on loans to enterprises virtually unchanged

to them, the increased need for funds resulted chiefly from greater financing requirements for inventories and working capital as well as fixed investment. In addition, banks believed that mergers and acquisitions, debt refinancing and restructuring as well as the low general level of interest rates contributed to the uptick in demand. As in the preceding two quarters, the banks surveyed in the BLS left credit standards for corporate loans virtually unchanged on balance.

Further substantial rise in loans to households for house purchase ...

Loans to households likewise showed further robust expansion in the fourth quarter of 2021. However, housing loans, which make up the most significant portion of household lending, recorded somewhat smaller inflows at year-end compared with previous quarters. As a result, the annual growth rate for housing loans shrank slightly to 5.4%. Contributing factors are likely to have been the noteworthy materials shortages in construction and other supply-side bottlenecks, which led to a widening discrepancy between orders and production in the fourth quarter.

... while credit standards remain unchanged according to BLS

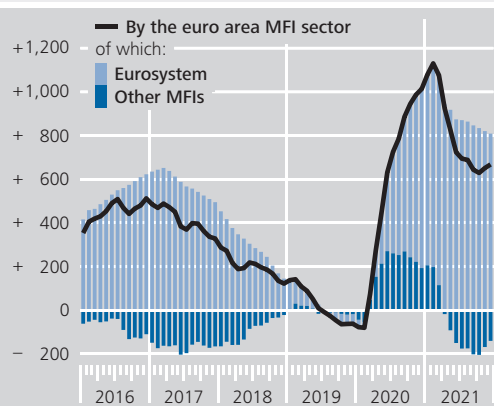

The BLS banks once again cited strengthened consumer confidence and the low general level of interest rates as major factors behind the lively demand for housing loans. Demand was also stimulated by the positive outlook on the residential real estate market. On the supply side, the banks participating in the BLS left their credit standards for loans for house purchase unchanged in the fourth quarter. Banks thereby continued on the path of essentially unchanged credit standards upon which they had embarked in the first quarter of 2021, after having tightened them in 2020, the first year of the pandemic.

Perceptible inflows in consumer credit, too

Consumer loans to households increased for the third consecutive quarter, although growth still fell significantly short of the rates recorded before the outbreak of the pandemic. Amongst other factors, the stricter containment measures introduced at the end of the year are likely to have put a fresh damper on activity in the

high-contact services sector in particular. The banks responding to the BLS reported only a marginal rise in demand for consumer and other loans. The main reasons they gave for this rise were improved consumer confidence and the low general level of interest rates. Furthermore, the banks surveyed as part of the BLS indicated that they had again marginally eased their credit standards for consumer and other loans.

Unlike the dynamic lending business, the MFI sector's net external asset position had a considerable dampening effect on monetary growth in the fourth quarter of 2021. As usual, the euro area's persistent current account surplus did lead to an inflow of capital when viewed in isolation. However, other balance of payments items brought about a larger negative effect overall. This manifested, in particular, in the form of the negative balance in cross-border securities transactions, which was most likely caused primarily by the higher yields outside the euro area, chiefly in the United States and the United Kingdom.

Net external asset position has considerable dampening effect on monetary growth

German banks' deposit and lending business with domestic customers

The deposit business among banks in Germany continued to lose momentum in the fourth quarter of 2021. This was mainly due to overnight deposits, where inflows weakened significantly over the course of 2021 amid fluctuations, reaching only a slightly positive build-up in the final quarter.

Build-up of deposits continues to slow

The overall slowdown in the accumulation of deposits in Germany was, above all, the result of a change in the investment behaviour of households, which continued to lose interest in building up overnight bank deposits. The increase in the opportunity costs of holding money over the year is likely to have played a key role in this adjustment. First, average interest on this type of deposit fell further into

Households' accumulation of deposits considerably weaker than usual

Deutsche Bundesbank

negative territory in the final quarter of 2021. Second, the high rates of inflation are likely to have raised households' awareness of the real cost involved in holding money.

By contrast, banks' lending business with the domestic non-bank sector grew sharply in the fourth quarter of 2021. This was mainly due to the strong expansion in lending to the domestic private sector. Lending to the public sector, on the other hand, contracted distinctly once again.

One of the main reasons for lending being so robust was the fact that non-financial corpor-

Credit business with non-banks very buoyant owing to loans to the private sector

ations took out a noticeably large amount of loans with domestic banks. In addition to funds needed for inventories and working capital, the banks surveyed in the BLS cited the funding of fixed investment as a key reason for the rise in demand. Although this meant that financing needs for fixed investment did recover, they continued to remain below the figures recorded before the outbreak of the pandemic.

While the increase in loans occurred across all maturities, it was particularly pronounced in the short-term segment. As in the euro area as a whole, the end of the reference period for obtaining special interest rate conditions in the context of the TLTRO-III series is likely to have played a role here. The end of this reference period encouraged some banks to push ahead with granting, in particular, short-term loans to non-financial corporations in the final quarter of 2021. Some of these loans were granted at very favourable interest rate conditions.

This is consistent with banks easing their credit terms and conditions on the whole in the fourth quarter. In this vein, banks narrowed their margins on average-risk and riskier loans. The last time this happened was in the final quarter of 2018. By contrast, according to the BLS, credit standards in corporate banking were left unchanged on balance in the quarter under review for the third time in a row.

Besides a flourishing corporate banking business, banks also saw robust net growth in lending to domestic households in the reporting quarter. This was on account of the consistently high inflows to housing loans. Households' persistently high demand for loans for house purchase is likely to have been fuelled by the expansion in government grants for energy-efficient buildings in the third quarter of 2021, which included not only low interest rate loans but also extensive subsidies towards new buildings and refurbishments. However, overall, the annual growth of loans taken out for house purchase did not accelerate further in the final quarter of 2021; at 7.1% at the end of Decem-

Substantial lending to non-financial corporations due to combination of various demand factors ...

... and banks' TLTRO-III motives

Lending policies in corporate banking support demand overall

Loans granted for house purchase see consistently high growth

ber, it came close to its all-time high of 7.2%, which it had reached in the preceding quarter.

Credit standards for loans for house purchase marginally tighter; slight easing of credit terms and conditions on the whole

Credit standards for loans to households for house purchase were again tightened marginally in net terms in the fourth quarter. The rejection rate was somewhat higher again compared with the preceding quarter. Following the rises in 2020, this means that the rejection rate is likely persisting at an elevated level. On balance, overall credit terms and conditions were eased marginally.

Lending policies on consumer and other credit friendly overall, but no notable increases in net lending

According to the BLS, the policies applicable to consumer loans and other loans to households were not adjusted in the final quarter of 2021, after they had been slightly eased on balance in the preceding three quarters. At the same time, the interest rates banks offered on consumer and other loans were favourable to demand in the fourth quarter. Nevertheless, there was no notable growth in current net lending in this segment. This development is likely attributable not least to a re-intensification of the pandemic at the end of the year.

Funding environment somewhat improved for German banks

In response to the ad hoc questions asked in January's BLS, German banks reported that their funding situation had improved again on the quarter, especially with regard to raising funding through medium to long-term debt securities and short-term deposits.

Banks responded to regulatory and supervisory activities by continuing to strengthen their capital positions last year. In the second half of

2021, consistent with banks' expectations, the level of the NPL ratio (percentage share of (gross) NPL stocks to the gross book value of loans) had only a marginal impact, or none whatsoever, on lending policy. For the first half of 2022, too, banks are not expecting the NPL ratio to exert any meaningful influence on their lending policies.

In the second half of 2021, German banks left credit standards largely unchanged in nearly all surveyed sectors of the economy. Only in the commercial real estate sector did they report a discernible tightening. For the first half of 2022, banks are planning to ease their credit standards for commercial real estate lending and to tighten standards for loans for house purchase.

In the second half of 2021, banks made no changes to their lending guidelines for coronavirus assistance loans guaranteed in whole or in part by the government. They had relaxed these standards in the first half of the year. Banks reported a continued decline in demand for loans to enterprises with pandemic-related government guarantees among large enterprises in the second half of 2021. The reason given for this was a reduction in the need for funds for fixed investment as well as the fact that fewer guaranteed loans were taken out to substitute non-guaranteed loans. Demand among small and medium-sized enterprises rose marginally because more funding was once again requested in order to meet acute liquidity needs.

Level of NPL ratio has no noteworthy impact on changes in German banks' lending policies in second half of 2021

Credit standards in commercial real estate tightened in second half of 2021

Credit standards for government-guaranteed loans unchanged in second half of 2021

■ Financial markets

■ Financial market setting

Financial markets shaped by increasing inflationary risks and expectations of monetary policy tightening

Developments in the international financial markets in the final quarter of 2021 and the first weeks of 2022 were marked by increasing inflationary risks. In light of surprisingly high rates of price increase on both sides of the Atlantic, market participants revised their inflation expectations for the major currency areas upwards multiple times for the current and the coming year. Together with the assessment that the burdens imposed by the Omicron variant would be manageable, this led some central banks to take a less accommodative monetary policy stance. The Bank of England, for instance, responded with two Bank Rate increases, while the Federal Reserve (Fed) announced in January that it deemed it appropriate to bring net asset purchases to an end in March and to raise the federal funds rate soon. Looking ahead, market participants are now anticipating a less expansionary monetary policy for the euro area, too. As a result, benchmark returns increased, and real interest rates also rose. On the whole, yields on euro area corporate bonds even rose significantly more strongly than government bond yields. On balance, the yield spreads of corporate bonds, which serve as an indicator of funding conditions for enterprises, were therefore slightly above their five-year average as this report went to press. International equity markets declined amid rising interest rates, but remained predominantly in positive territory compared with the end of September. This was due, first and foremost, to an improvement in overall earnings expectations, particularly on the back of increased profit margins at large enterprises. Foreign exchange market developments were also influenced largely by the persistently high inflation rates worldwide, the measures central banks have announced to combat inflation as well as those already taken, and speculation among market participants regarding further steps towards monetary policy normalisation.

Measured as a weighted average against the currencies of 19 major trading partners, the euro has, on balance, depreciated by 2.1% net since the end of September 2021.

■ Exchange rates

The euro lost 3.2% of its value compared with the US dollar in the first three weeks of November 2021 due to stronger rate hike expectations for the United States, but was able to recover somewhat towards the end of the month. The highly contagious Omicron variant of COVID-19 temporarily muted market expectations of an early Federal Reserve interest rate hike. In the euro area, however, the correction of expectations was comparatively small, as Eurosystem policy rate increases had not been expected until later in the first place. The temporary convergence of market views concerning the monetary policy stances of the Eurosystem and the US central bank allowed the euro to rally against the dollar, on balance. Subsequently, this currency pair moved in a narrow range around US\$1.13 per euro – without any clearly discernible trend – until into the first week of January.

Euro down against the US dollar on balance

The euro/US dollar exchange rate did not see more movement until January. After a short-lived strengthening of the euro, sentiment shifted in favour of the US dollar in the second half of January as various members of the Federal Reserve's Open Market Committee signalled a speedy monetary policy response to the previously published high level of consumer price inflation of 7% in the United States and that it might soon begin to tighten its policy rate. Increased geopolitical tensions between Russia and Ukraine additionally propped up the US dollar. As a result, the euro reached its lowest level of the last 20 months, trading at US\$1.11. However, more surprisingly high inflation figures emerged from the euro area at the

end of the month, prompting market expectations of a normalisation to be brought forward here, too, which strengthened the euro again. The euro appreciation accelerated further when, at the press conference following the ECB Governing Council's meeting in February, a policy rate adjustment during the current year was no longer explicitly ruled out. As this report went to press, the euro stood at US\$1.14. It has thus lost 1.8% of its value since the end of September.

Euro also loses ground against the pound sterling ...

The British pound appreciated on a broad basis after the Bank of England raised its official Bank Rate in mid-December to combat the UK's own high inflation. Given the rapid spread of new COVID-19 infections in the United Kingdom, a majority of observers had not anticipated a decision of this kind at this point in time. At the beginning of February, the Bank of England upped the ante with a second interest rate hike, after the UK inflation rate once again proved higher than expected. While this initially caused the euro to weaken further against the pound sterling, it rallied markedly against the UK currency when, later that day, the markets revised their interest rate outlook for the euro area upwards following the latest monetary policy meeting of the ECB Governing Council. For a few days, this more than made up for the immediately preceding exchange rate losses. When this report went to press, the euro was trading at £0.83, around 3.0% lower than at the end of September.

... but records gains against the yen

Following the Japanese central bank's December meeting, the yen began to depreciate against the euro and other currencies. This was due to monetary policy decisions and Japan's low inflation rates (by international standards) both failing to spark any market fantasies of inflation rate increases. In mid-January, however, sentiment in the foreign exchange markets swung temporarily in the yen's favour when the Bank of Japan raised its inflation forecast for the coming fiscal year and pointed to balanced price risks in its Outlook Report, having previously highlighted deflationary risks for

years. Nevertheless, following the ECB Governing Council's monetary policy meeting, the euro once again appreciated against the yen, too. As this report went to press, the euro was trading at ¥131. It was thus some 0.9% above its value at the end of September.

Measured as a weighted average against the currencies of 19 major trading partners, the euro has depreciated by 2.1% net since the end of September. It lost ground especially against the currencies of countries whose central banks have already chosen to raise policy rates in the current cycle. Losses were consequently recorded against the pound sterling, as well as

Euro weaker in effective terms

Bond yields* in the euro area and selected countries

Deutsche Bundesbank

the Norwegian krone (-0.4%), the forint (-1.1%), the Czech koruna (-4.4%) and the zloty (-2.5%). On balance, the price competitiveness of euro area suppliers improved over the period under review, but looking at the long-term average, their competitive position can currently still be considered neutral.

Securities markets and portfolio investment

Bond market

Nominal government bond yields rose considerably in all major currency areas since the end of September. This was chiefly due to reduced concerns about the economic impact of the Omicron wave – despite high infection rates – and an initial tightening of monetary policy in a solidifying inflation environment. Fiscal policy measures, meanwhile, played a subordinate role. The failure of the US government’s “Build

Ten-year government bond yields up globally ...

Back Better” social and infrastructure policy package at the beginning of 2022, for instance, only temporarily dampened the rise in yields. In the United States, nominal yields on ten-year US Treasuries rose sharply by 48 basis points from the end of September to reach 2.0%. As expectations concerning average inflation over the next ten years derived from inflation swaps increased only slightly in the period under review, the real rate of interest increased as well.

Against the backdrop of rising inflation expectations and the Bank of England’s tightening of monetary policy, yields on ten-year gilts in the UK rose by 45 basis points. In light of the steps made toward a normalisation of monetary policy, Japanese government bonds also saw somewhat higher yields. However, the increase in yields was significantly weaker here (+16 basis points). At 0.2%, yields on ten-year government bonds therefore continued to move within the range in which market participants assume that the Bank of Japan wishes to keep interest rates.

Yields on ten-year government bonds rose by 43 basis points, a similar level of growth as that seen in US and UK bond yields; as this report went to press, they had risen to 0.2%, the first time they had clearly been in positive territory since spring 2019. In fact, the increase in the interest rate even amounted to 59 basis points in relation to the ECB’s Governing Council meeting in mid-December. This clear increase indicates that market participants now see the inflation process in the euro area as involving significantly higher upside risks. They expect that the euro area will also see a reduction in policy easing and are pricing in the corresponding stronger monetary policy responses. This was also evident in market developments during the press conference after the ECB Governing Council’s monetary policy meeting at the beginning of February, when short-term bond yields in particular rose sharply.

... as well as in Germany

Model breakdowns of the Bund yield curve also indicate that the increase in ten-year nominal

Rise in ten-year bond yields ultimately driven by expected interest rate path

interest rates since the end of September is ultimately entirely down to a rise in risk-neutral short-term interest rate expectations, while the term premium has decreased. This increase in implied short-term interest rates reveals that market participants expect a steeper interest rate path and thus tighter monetary policy in the longer term given current inflation concerns.

German yield curve steeper

The yield curve derived from the yields on Federal securities has shifted over the reporting period; as this report went to press, it was significantly steeper in the short to medium-term maturity segment. While Federal securities with a residual maturity of up to six years were yielding less than the deposit facility rate of -0.5% at the start of the fourth quarter, yields on two-year and longer-dated securities were above this rate at the time this report went to press. At the same time, the premium that market participants pay for the particularly high liquidity and scarcity of Federal securities increased. As a result, the yield spread between Federal securities and maturity-matched bonds issued by the Kreditanstalt für Wiederaufbau (KfW) widened distinctly.

Widening of yield spreads in euro area

The GDP-weighted yield on ten-year euro area bonds (excluding Germany) has also risen since the end of September 2021 (by 70 basis points to 1.0%). The interest rate spread between this measure and German Bunds with the same maturity increased by 27 basis points to 0.8%. While many euro area Member States saw yields move in fairly close concert with Bunds, yield spreads widened disproportionately for countries with poorer credit ratings such as Greece (+132 basis points) and Italy (+55 basis points). The increase in Greek government bond yields probably also reflects the fact that net asset purchases under the pandemic emergency purchase programme (PEPP) will be discontinued at the end of March 2022 as planned and Greek government bonds are not eligible for purchase under the topped-up public sector purchase programme (PSPP). In Italy, increased uncertainty in connection with the presidential

Deutsche Bundesbank

elections also temporarily played a role. At the time this report went to press, liquidity indicators showed no particular tensions in the market for euro area government bonds. Relative to the implied volatility of options on futures contracts for Bunds, price uncertainty nevertheless rose noticeably; at the time this report

went to press, it was considerably higher than its five-year average. Higher volatility is, however, not unusual in periods of rising policy rates.

Inflation swaps indicate that market participants revised their short-term inflation expectations upwards multiple times in recent months in response to rates of price increase that were higher than generally expected. As this report went to press, market-based inflation expectations for the Harmonised Index of Consumer Prices (HICP) in the euro area (excluding tobacco) stood at 5.0% on average for 2022. At present, market participants do not anticipate an annual rate of change in the HICP of 2% until November 2023. Surveys conducted by Consensus Economics also showed that inflation expectations for 2022 were revised upwards in January and February; the annual average stood at 3.9% at last count. Survey-based inflation expectations for the coming months were consistently below the market-based values. The positive inflation risk premium reflected in the difference between market and survey-based values for this period suggests that market participants are hedging against risks arising from unexpectedly high inflation in the future. The option-implied probability that average euro area inflation over the next five years could exceed the new target of 2% has increased from 40% at the end of September to 49% as this report went to press.

Market participants do not expect inflation rates of 2% until November 2023

In contrast to the inflation expectations over the short and medium term, market data point to virtually unchanged inflation expectations for forward inflation rates in five years. Thus, at 1.8%, the forward inflation rate over a five-year period starting in five years' time, which is derived from inflation swaps, was only marginally shy of its value at the end of September. Survey-based inflation expectations calculated by Consensus Economics for the euro area six to ten years ahead were raised to the target of 2% in January, compared with 1.9% in October 2021.

Forward inflation rates in euro area

Yield spreads of corporate bonds up

Yields on BBB-rated European corporate bonds with residual maturities of between seven and ten years have risen significantly since September 2021. Bonds issued by financial corporations recorded an increase in yields of 111 basis points to 2.1%. At 1.7%, yields on non-financial corporate bonds were 96 basis points higher than at the end of September 2021. Since the yields on matched-maturity Federal securities rose less sharply on balance, the spreads of European financial and non-financial corporate bonds over Bunds widened by 68 and 52 basis points, respectively. The increase in yields on high-yield bonds was particularly strong, with spreads rising by 95 basis points. At the same time, the credit default premia for debtors with poor creditworthiness increased (iTraxx Crossover (five years) +78 basis points). Measured by yield spreads, funding conditions for European enterprises in the capital market were somewhat above their five-year average as this report went to press.

Low net sales in the bond market

Gross issuance in the German bond market in the fourth quarter of 2021 fell significantly short of the value for the previous quarter. Overall, German borrowers issued paper to the tune of €354 billion, down from €442½ billion in the previous three months. Net of redemptions and changes in issuers' own holdings, domestic issuers ramped up their capital market borrowing by €12 billion. The outstanding volume of foreign debt securities in the German market fell by €11½ billion in the fourth quarter. On balance, the total outstanding volume of bonds in Germany thus climbed by €1 billion in the quarter under review.

Lower net public sector issuance

In the final quarter of 2021, the public sector issued bonds to the tune of €21½ billion net, following €31 billion in the previous quarter. The Federal government (including the resolution agency classified as part of central government) issued mainly Federal bonds (Bunds), primarily with a ten-year maturity (€15 billion). This contrasted with net redemptions of five-year Federal notes (Bobl) totalling €4½ billion. State

and local governments redeemed debt securities worth €4½ billion on balance.

In the quarter under review, domestic enterprises redeemed bonds worth a net €8 billion, following net issuance amounting to €13 billion in the previous quarter. These redemptions were, on balance, almost solely attributable to other financial intermediaries' long-term securities expiring.

Domestic credit institutions reduced their capital market debt in the quarter under review by €1½ billion, following net issuance of €9 billion in the previous quarter. Redemptions mostly affected debt securities of specialised credit institutions (€1½ billion) and public Pfandbriefe (€1 billion). By contrast, other bank debt securities that can be structured flexibly were issued to the tune of €1½ billion net.

The Bundesbank was the chief net purchaser of debt securities in the fourth quarter of 2021, in-

Outstanding volume of corporate bonds down

Fall in credit institutions' capital market debt

Purchases of debt securities

while the US S&P500 increased by 1.7%. Meanwhile, the Euro STOXX recorded comparatively weak growth (+0.5%). By contrast, the CDAX and the Nikkei recorded net losses on balance, sliding 1.5% and 7.5% respectively.

Price developments on either side of the Atlantic varied greatly in individual sectors. For instance, technology stocks, in particular, which recently reached high valuations, sustained significant price losses in some cases. Market participants anticipate that these stock corporations, which have particularly strong growth prospects, will see a disproportionately positive earnings trend in the medium and long term as compared with enterprises with an established business model. A higher interest rate means that these profits, which lie far in the future, are discounted at a higher rate and their present value is reduced accordingly, which weighs on these enterprises' share price. By contrast, shares in energy companies have experienced strong growth given the sharp rise in energy prices.

creasing its bond portfolio by €58½ billion net, principally under the Eurosystem's asset purchase programmes. Domestic non-banks acquired debt securities for €13 billion net, with domestic paper the focus of interest. By contrast, foreign investors and domestic credit institutions disposed of fixed-income securities amounting to €42½ billion and €28 billion net respectively.

Equity market

Prices in the international equity markets have declined markedly since the start of January when expectations of rising central bank interest rates became entrenched. However, previous price gains meant that some markets were still trading slightly higher than at the end of the third quarter of 2021. This was true of equity markets in the United Kingdom and the United States, for example – the UK's FTSE 100 index rose by 6.4% from the end of September,

Similarly, strong price gains were recorded by European bank stocks, which – spurred by the prospect of improved margin business – benefited disproportionately from an interest rate rise and the associated steepening of the yield curve. Higher earnings expectations for banks have led to the equity prices of banks listed in the Euro STOXX increasing by 9.0% since the end of the third quarter of 2021, thus significantly outpacing the market as a whole. By contrast, bank stocks in the United States posted lower gains (+2.6%). In this context, the overall flattening of the US yield curve, as measured by the spread between two-year and ten-year yields, observed since September had a dampening effect.

Bank stocks in the euro area outperform market as a whole

Price uncertainty in the equity markets – as measured by the implied volatility of equity indices calculated from options – was slightly higher than at the end of September 2021 on balance. It experienced two wave-like phases during the reporting period. Initially, the World

Stock market volatility slightly up

Majority of international equity markets experience rising prices

Health Organization's classification of the Omicron variant as a variant of concern temporarily led to a strong increase in equity market volatility worldwide. However, as growing evidence emerged that this virus variant could be less severe than previously thought, volatility in the equity markets subsided again in the following weeks. At the start of the year, global monetary policy tightening and geopolitical tensions contributed to a renewed rise in price uncertainty.

Valuations down in the euro area, still low by historical standards

European equity valuations became more favourable compared with the end of September 2021. For instance, the implied cost of equity of the Euro STOXX – calculated from the Bundesbank's dividend discount model – went up. This indicator recently recorded high levels by historical standards, which suggests that the prices of the stocks that constitute the Euro STOXX are valued moderately in relation to the companies' earnings outlook. It should be noted, however, that analysts' short-term earnings expectations and medium-term earnings growth expectations remain at a very high level according to IBES surveys.

Valuations in the United States up slightly

Different developments were observed in the United States. Here, the implied cost of equity declined somewhat. Given analysts' current earnings expectations, this indicates a balanced valuation level overall.

Stock market funding

On balance, funding in the German stock market totalled €18½ billion in the final quarter of 2021, compared with €10 billion in the preceding quarter. A large-scale capital injection by a public limited company played a key role in this context. The volume of foreign shares in the German market rose by €12½ billion over the same period. On balance, equities were purchased mainly by resident non-banks (€36½ billion), which also include investment companies. Domestic credit institutions added €2½ billion net to their share portfolios, while foreign investors reduced their equity exposure in Germany by €7½ billion on balance.

Sales and purchases of mutual fund shares

Mutual funds

In the final quarter of 2021, domestic investment companies recorded a significant net inflow of €68½ billion, compared with €25 billion in the previous quarter. On balance, the bulk of the net new money was channelled to specialised funds reserved for institutional investors (€56½ billion). Among the asset classes, mixed securities funds, in particular, saw significant inflows of capital (€26½ billion), with funds of funds (€11 billion), equity funds (€8½ billion), open-end real estate funds (€7 billion) and bond funds (€4½ billion) also recording inflows. The outstanding volume of foreign mutual fund shares in Germany rose by €40 billion in the period under review. Mutual fund shares were bought on balance almost exclusively by domestic non-banks, which added a notable €106½ billion net worth of fund shares to their portfolios. Most of these shares were issued by domestic mutual funds. German credit institutions bolstered their fund portfolios by €4½ billion net, while non-resident investors disposed of domestic fund shares worth €3 billion net.

■ Direct investment

Direct investment sees net capital exports

Transactions in cross-border portfolio investment resulted in net capital exports of €95 billion in the fourth quarter of 2021. Direct invest-

ment, too, resulted in net capital outflows (€18½ billion).

Enterprises domiciled in Germany expanded their direct investment abroad by €27½ billion between October and December 2021 (previous quarter: €37 billion). They boosted their equity capital in foreign subsidiaries by €6 billion. Furthermore, they provided affiliated group entities with additional loans worth €21½ billion. The fourth quarter saw considerable volumes of direct investment funds flowing from Germany to the United States (€9 billion), Luxembourg (€7½ billion) and Sweden (€3½ billion). By contrast, domestic enterprises reduced their investment in the Netherlands (€11 billion) and in China (€2 billion).

German direct investment abroad results in capital exports

Conversely, foreign enterprises increased their direct investment in Germany by €9 billion, following €19 billion in the third quarter of 2021. On balance, the additional funds were provided exclusively in the form of equity capital. Intra-group lending saw the granting of new loans and redemptions balance each other out. Particularly high inflows of direct investment were recorded from Ireland (€6 billion) and the United States (€5½ billion) in the fourth quarter. Enterprises from the Netherlands (€11 billion) and the United Kingdom (€3 billion) reduced their direct investment funds in Germany.

Capital inflows through foreign direct investment in Germany

■ The German economy

■ Macroeconomic situation

Distinct decline in German economic output towards end of 2021

Economic activity in Germany declined markedly in the fourth quarter of 2021, having shown strong growth in the third quarter. According to the Federal Statistical Office's flash estimate, real gross domestic product (GDP) shrank by 0.7% on the quarter after seasonal adjustment.¹ It was thus down by 1.5% on its pre-crisis level in the fourth quarter of 2019. Real GDP grew by 2.8% in 2021 as a whole, having fallen in 2020 as a result of the pandemic. The preliminary annual outturn was revised upwards slightly.

Resurgence of pandemic depressed services sector and private consumption; industrial production and exports up despite ongoing issue of serious supply bottlenecks

The decline in economic output in the fourth quarter of 2021 was largely due to the resurgence of the pandemic. The resulting containment measures and changes in behaviour hit some services sectors hard. In addition, it appears that activity in the construction sector remained lacklustre in spite of high demand. The construction sector is currently experiencing a lack of labour and a major – albeit decreasing – materials shortage. By contrast, industry made a positive contribution. In the first three quarters of 2021, growing bottlenecks in the supply of intermediate goods had curbed industrial production despite order books being very well filled. Although surveys indicated that enterprises still considered the supply problems to be severe in the fourth quarter, the increase in industrial production suggests that they eased somewhat. On the expenditure side of GDP, one particular way in which the resurgence of the pandemic was reflected was in a clear decline in private consumption. Government consumption rose, however, probably in connection with more vaccinations and tests. Investment in machinery and equipment as well as exports are also likely to have grown in the

wake of positive developments in industry. Aggregate economic output is likely to decline again markedly in Q1 2022 due to the pandemic before picking up sharply in Q2.

Goods exports were up significantly in the fourth quarter of 2021 in price-adjusted terms. The rise is in line with high foreign demand and the latest expansion in industrial output. Broken down by region, exports to euro area countries and non-euro area countries contributed to the growth in equal measure, with the increase in the value of exports broadly based in regional terms. Broken down by category of goods, exports of capital goods recorded considerable growth, particularly for motor vehicles and motor vehicle parts, according to the price-adjusted figures available up to November. Exports of consumer goods were clearly higher, although slightly fewer pharmaceutical prod-

Goods exports up significantly

Aggregate output

Adjusted for price, seasonal and calendar effects

Source of unadjusted figures: Federal Statistical Office. ¹ Price and calendar adjusted.
 Deutsche Bundesbank

¹ Seasonal adjustment here and in the remainder of this text also includes adjustment for calendar variations, provided they can be verified and quantified.

ucts were exported. Exports of intermediate goods edged up slightly.

Investment in new machinery and equipment likely to have risen

Investment in new machinery and equipment is likely to have risen in the fourth quarter. The slight easing of supply bottlenecks and increased capacity utilisation in manufacturing are likely to have boosted investment activity. Manufacturers of capital goods experienced a steep rise in domestic sales. In addition, the value of capital goods imports climbed strongly according to the figures available up until November. Enterprises are likely to have scaled back investment in their fleets of vehicles, however. This is indicated by the number of com-

mercial passenger vehicle registrations and registration figures for commercial vehicles, which dropped sharply in the fourth quarter.

Construction investment is likely to have remained lacklustre in the final quarter of 2021. Sales figures in the main construction sector available up to November increased strongly on the previous quarter in terms of value, but in real terms the rise was significantly smaller due to high price increases. Whilst investment in commercial buildings has probably risen markedly, investment in housing construction is likely to have remained virtually stable. Finishing trades, for which no sales data are available yet for the fourth quarter, could have dampened the overall figure. This is indicated by the sharp fall in output in the finishing trades.

Construction investment likely to be lacklustre

Private consumption is likely to have gone down significantly in the fourth quarter of 2021, after it had shown a steep rise in the third quarter. The escalation of the pandemic dampened the consumption of high-contact services in particular. Sales in the hotel and restaurant sector, for example, declined strongly according to the price-adjusted figures available up to November. Real retail sales were likewise slightly lower. Bricks-and-mortar retailers of textiles, clothing, footwear and leather goods posted a particularly steep fall in sales. Sales of information and communication technology equipment and furniture, furnishings, household appliances and home improvement materials also experienced a considerable slump. This contrasted with a substantial rise in mail order and online trade. Car purchases are likely to have increased in the fourth quarter. This is indicated by the number of new private car registrations, which rose steeply according to the German Association of the Automotive Industry (VDA).

Private consumption down significantly

Imports of goods rose steeply in real terms in the fourth quarter of 2021, with imports from euro area countries and non-euro area countries expanding at a similar pace. Broken down by category of goods, the volume of consumer

Steep rise in imports of goods

goods imports saw a particularly substantial increase according to the figures available up to November. Considerably more pharmaceutical products were imported, which was probably partly connected with a greater number of vaccinations and tests. Imports of capital goods likewise increased steeply on the back of a sharp pick-up in imports of motor vehicles and motor vehicle parts.

■ Sectoral trends

Possible turn-around in industry

After seasonal adjustment, industrial output was up significantly in the fourth quarter of 2021 compared with the third quarter (+1¾%). This could mark a turning point. Before this, industrial output had fallen sharply since the beginning of 2021. Growing bottlenecks in the supply of intermediate goods had prevented industry from benefiting from the high demand for industrial products. The recent rise in industrial output suggests a slight easing of the supply bottlenecks. This is consistent with the fact that delivery times increased to a smaller extent according to surveys conducted by IHS Markit. However, the share of enterprises in the manufacturing sector reporting production delays due to supply bottlenecks rose further in the fourth quarter according to ifo Institute surveys. The higher industrial output in the fourth quarter was attributable to a rise in the production of capital goods. Motor vehicle production, in particular, experienced a significant increase following a strong slump. Other transport equipment was up substantially, too. By contrast, there was a clear drop in the manufacture of machinery and equipment and the production of computer, electronic and optical products was slightly lower. The production of consumer goods remained broadly unchanged, although more pharmaceutical products were produced. Intermediate goods production declined slightly. Overall, industrial output was still down by 4¾% on the pre-crisis level of the fourth quarter of 2019.

Output in industry and in construction

2015 = 100, seasonally and calendar adjusted, quarterly data, log scale

Source of unadjusted figures: Federal Statistical Office. 1 Main construction sector and finishing trades. Deutsche Bundesbank

According to the ifo Institute, capacity utilisation of tangible fixed assets in manufacturing rose slightly between the surveys in October and January and was distinctly above its long-term average. Manufacturers of capital goods saw a particularly steep rise in capacity utilisation. This is consistent with the robust growth in capital goods production. Producers of consumer goods also experienced a marked increase in capacity utilisation, however, whereas there was a slight fall in the intermediate goods sector.

Slight increase in industrial capacity utilisation

Construction output was clearly down again in the fourth quarter after adjustment for seasonal variations (-2%). This was due to considerably less production in the finishing trades. It should be noted, however, that initial data often undergo substantial revision. The slightly higher output in the main construction sector was not enough to offset the decline in the finishing trades. Sluggish activity in the construction sector might be related to a shortage of

Construction output clearly down again

labour. The percentage of enterprises in the main construction sector reporting a disruption to production due to a lack of staff reached a new high, according to surveys by the ifo Institute. By contrast, various economic indicators suggest favourable conditions for growth in construction in the fourth quarter. Although high from a long-term perspective, the share of firms suffering from material shortages was in decline. At the same time, demand for construction work remained brisk, with the reach of the order books in the main construction sector as determined by ifo Institute surveys attaining a new record high. This resulted in a further steep rise in the cost of construction work, however. Equipment utilisation edged up again and remains at a high level from a long-term perspective.

Distinct adverse effect on services sector

Economic output in the services sectors is likely to have fallen markedly due to the resurgence in pandemic activity. On an average of October and November – the last period for which figures are available – price-adjusted sales in the hotel and restaurant sector were down sharply compared with the third quarter. Real retail sales declined only slightly in the fourth quarter, which was due mainly to the fact that mail order and online trade was up substantially. Motor vehicle trade is also likely to have been sluggish. According to data provided by the German Association of the Automotive Industry (VDA), new passenger car registrations dropped significantly due to the strong decline in commercial vehicle registrations. By contrast, data available up to November show that price-adjusted wholesale sales rose slightly in line with developments in industry. Results of ifo Institute surveys assessing the situation indicate weak business activity in most of the remaining services sectors.

■ Labour market

Labour market recovery continued in Q4

The factors that curbed economic activity in the fourth quarter had barely any impact on the labour market. Employment continued to

recover, and both unemployment and the use of short-time working arrangements fell substantially. Leading indicators suggest only a comparatively mild dip in the labour market in the first quarter of 2022, despite the currently high infection rates.

Employment levels rose significantly in the last few months of 2021. On an average of the fourth quarter, the seasonally adjusted number of persons in work rose by 157,000 on the quarter overall, representing an increase of 0.3%. The employment losses at the beginning of the pandemic were therefore already recouped for the most part. Nonetheless, the number of persons in employment was still down by ½% compared with the beginning of 2020. Employment subject to social security contributions presents a much more favourable picture. The core form of employment, which received massive support through the use of short-time work during the crisis, is now just over 1% higher than the high pre-crisis employment level. By contrast, exclusively low-paid part-time employment plays a role as a flexibility reserve; it moved in line with the severity of the containment measures during the pandemic. The importance of its role also left a mark in wholesale and retail trade and the hotel and restaurant sector, which were particularly hard hit by the measures.

Employment up again significantly in fourth quarter, jobs subject to social security contributions well above pre-crisis levels

The share of employment shifted across the sectors during the crisis and these trends have also continued in the past few months. On an average of October and November, the IT sector, business-related services (excluding temporary agency employment) and construction registered the largest increase in employment subject to social security contributions compared with the previous quarter. The previous relatively strong recovery in the hotel and restaurant sector ground to a halt again with the Delta wave of the pandemic. A slight improvement was observed in other services sectors. The number of employees in manufacturing remained no more than stable, however. Temporary agency employment, whose employees

Jobs subject to social security contributions remain on upward trajectory in several services sectors

are often deployed in industry, even declined somewhat.

Short-time working scaled back further

Cyclical short-time working declined further up to November last year, albeit at a slower pace than in the third quarter. According to the initial estimate by the Federal Employment Agency, 574,000 persons were still in economically induced short-time work in November, almost one-tenth of the highest level in April 2020. However, a slight increase may be expected again in the coming months due to the intensification of the pandemic. The number of persons named in notifications of short-time work rose in November, but an even greater increase was noted in December and January. Nonetheless, registrations were down considerably on the level seen during the second coronavirus wave last year. Wholesale and retail trade and the hotel and restaurant sector were once again primarily affected.

Unemployment almost down to pre-crisis level

Registered unemployment was also down significantly. In the quarter under review, it declined by 117,000 persons in seasonally adjusted terms, with the unemployment rate falling by 0.2 percentage point. In January 2022, the number of unemployed persons continued to drop to a new total of 2.34 million, or 5.1%, thus almost matching the low of the first quarter of 2020 again. However, the pandemic has caused a rise in the share of unemployed persons receiving the basic allowance for job seekers or those who are long-term unemployed. These persons have often not received any vocational training and, in particular, face the threat of their labour market-related skills becoming worthless. This makes it more difficult for them to return to employment, even in view of the ongoing shortage of qualified personnel. On the other hand, the number of unemployed persons claiming insurance benefits who are relatively easy to place is already lower than immediately before the outbreak of the pandemic.

Labour shortages returned to many industries with the recovery in the third and fourth quar-

Labour market

Seasonally adjusted, quarterly data

Sources of unadjusted figures: Federal Statistical Office and Federal Employment Agency. **1** Not seasonally adjusted. **2** Excluding seasonal jobs.
 Deutsche Bundesbank

Labour supply falls due to unfavourable age structure effect and lower levels of migration during pandemic

ters of 2021. The situation was exacerbated by the impact of a negative age structure on labour supply. This results from the demographic situation in Germany and has become increasingly noticeable since 2020. It is also the main reason for the lower labour force participation rate. By contrast, only a few persons have withdrawn from the labour market during the crisis due to “discouraged worker” effects. Immigration is also down on previous years, however. The sequencing of pandemic-induced closures and openings is clearly reflected in the monthly immigration statistics published by Germany’s Federal Statistical Office. Statistics for net migration to Germany recovered quickly with the easing of respective measures. In the second half of 2020 and the second half of 2021, the number of migrants was even higher than in the second half of 2019² but this was not enough to compensate for the low level of immigration in the first six months of both 2020 and 2021. The labour force is currently markedly smaller overall than before the pandemic.

Recruitment plans expansionary in both short and medium term

The leading labour market indicators deteriorated over the past few months. The unemployment barometer of the Institute for Employment Research (IAB) is currently in neutral territory. This would suggest unemployment remaining at the current low level over the next few months, but not declining further. By contrast, the employment barometers of the ifo Institute and the IAB show that the willingness of enterprises to recruit new staff is down only moderately. Overall, the expansionary recruitment plans of enterprises continue to predominate in the short term but there are fundamental signs of employment growth as well. The reported number of vacancies subject to social security contributions has already been rising for one and a half years and is now higher than at the beginning of 2020. A very high number of job vacancies are being reported to the Federal Employment Agency. However, the vacancy period for open positions has likewise already returned to the record level seen before the crisis. This is consistent with the various reports of labour shortages. Furthermore, a lack

of personnel during the Omicron wave could distinctly curb the number of hours worked in the first quarter.

■ Wages and prices

Negotiated wages climbed more sharply in the fourth quarter of 2021 than in the third quarter. Including additional benefits, they were up by 1.5% on the year in the fourth quarter, compared with 1.0% in the previous quarter. In both quarters, these growth rates were, however, depressed by delays in paying out bonuses and negative base effects as a result of high coronavirus bonuses a year earlier. Basic remuneration, which more accurately reflects the underlying momentum of developments in negotiated wages, rose slightly more strongly both in the third and fourth quarters, at 1.4% and 1.8% on the year, respectively. Actual earnings are likely to have risen considerably more robustly than negotiated wage rates in line with the marked reduction in short-time work in the fourth quarter.

Negotiated wages rose more sharply in Q4 than in Q3; actual earnings probably climbed considerably again

Looking at 2021 as a whole, negotiated wages rose significantly less, at just 1.5%, than in the year before. This was chiefly because the pandemic resulted in modest wage agreements. Actual earnings, meanwhile, rose a hefty 3.2% according to provisional calculations by the Federal Statistical Office, mainly as a result of the marked drop in short-term work. The wage drift was consequently well into positive territory again, at 1.6 percentage points, after a clear decline in 2020.

Wage drift well into positive territory again in 2021

In the ongoing year, the rise in negotiated wage rates is still largely influenced by wage agreements concluded in previous years. At the

² 5% more persons moved to Germany on balance in the second half of 2020 compared to one year earlier. It was 55% fewer in the first half of the year, however. The decline of just over one-third in the first half of 2021 compared to the pre-crisis year was likewise considerable. According to statistics up to November 2021, on balance 42% more persons have already moved to Germany than in the corresponding period of 2019.

Small 2022 wage round in an environment of high inflation rates

time the agreements were made, there was a great deal of uncertainty surrounding the economic outlook, and inflation rates were low. The situation will likely be different in this year's small wage round for roughly 8 million employees. However, the trade unions' wage demands are currently only slightly higher than last year, at 5% to 6% for a period of 12 months. Nonetheless, they could potentially be higher in the future. The German Mining, Chemical and Energy Industries Union (IG BCE), for instance, has not yet specified its concrete wage demand for the chemical industry, but has indicated that it is aiming for a perceptible increase in real wages given high inflation rates and a high inflation outlook, amongst other factors. Later in the year, wage negotiations will take place, inter alia, in the insurance sector, in the printing industry, the steel industry, the private transport industry and, in the fourth quarter, in the metal and electrical engineering industry. The favourable macroeconomic outlook, increasing labour market shortages and high inflation rates could then help bring about markedly higher wage agreements than in the recent past.

Planned increase of general minimum wage to €12 per hour raises pressure on aggregate wages

The general statutory minimum wage has stood at €9.82 per hour since 1 January 2022, and is set to increase to €10.45 per hour on 1 July 2022. The Federal Labour Minister is aiming to lift it to €12 per hour from 1 October 2022. This political intervention in the wage-setting process would raise pay distinctly in the lower wage brackets as well as having a marked impact on the wage brackets above, thus presumably increasing upward pressure on aggregate wages. Looking at the historical relationships, the macroeconomic effects will probably be manageable (see the box on pp. 54 f.). However, in the current environment of very high inflation rates, a potentially stronger pass-through of wages to prices cannot be ruled out.

Inflation rate hit record level at end of 2021

Consumer price inflation continued to accelerate in the final quarter of 2021. Between October and December, the Harmonised Index of Consumer Prices (HICP) rose by an average of

Rates of pay and wage drift

Year-on-year change, on monthly basis

Sources: Federal Statistical Office (actual earnings) and Deutsche Bundesbank (negotiated rates of pay). ¹ Wage drift is calculated as the annual change in the ratio of actual earnings to negotiated rates of pay.
 Deutsche Bundesbank

1.2% on the quarter in seasonally adjusted terms. This compares with a gain of 1.0% in the third quarter. The higher inflation rate was chiefly due to energy prices, which increased even more sharply than before in line with crude oil prices. Growth in prices for food, services and non-energy industrial goods remained strong, but was slightly down on the previous quarter. The HICP rose very significantly by 5.4% on the year, following 3.5% in the third quarter. Excluding energy and food, the inflation rate grew from 2.1% to 3.6%, thus also reaching its highest level since the euro area was established.

At 3.2%, average consumer price inflation for 2021 increased very considerably on the year. One factor was that the base effect of the temporary reduction in VAT rates in the second half of 2020 significantly increased inflation rates in the corresponding period of 2021.³ Another

On an annual average, consumer prices rose very considerably in 2021

³ See Deutsche Bundesbank (2021b).

The macroeconomic impact of the planned increase in the general statutory minimum wage to €12 per hour

Under the coalition agreement, the general statutory minimum wage is set to be raised to €12 an hour. This increase, according to reports, is scheduled to take effect on 1 October 2022 and would be in addition to the regularly scheduled hike to €10.45 per hour with effect from 1 July 2022. It will occur outside the usual framework and without the involvement of the Minimum Wage Commission. Contrary to the provisions of Section 9(2) of the Minimum Wage Act (*Mindestlohngesetz*), it will probably not just track the past years' aggregate negotiated wage developments. This administrative intervention in the wage structure is likely to lead to changes in hours worked, employment, labour force participation, and inflation and GDP trends. These impacts can be quantified using the Bundesbank's macroeconomic model. The starting point here is the direct stimulus on wages of the minimum wage hike, calculated in a back-of-the-envelope manner.

Impacts on aggregate wage growth are caused primarily by changes in the wages of the directly affected employees and their spillover effects on the upstream wage brackets. The set of directly affected employees is broken down into three groups: full-time and part-time employees subject to social security contributions, and marginally employed persons. In order to quantify the respective share of directly affected employees subject to social security contributions working either full-time or part-time in the fourth quarter of 2022, trends in effective wages are extrapolated up until then.¹ The share of directly affected marginally employed persons was kept unchanged in the calculations. The direct macroeconomic wage impact is composed of the directly af-

ected employees' share of the aggregate wage bill and their percentage pay rise. Under further assumptions regarding the wage distribution in the €10.45 to €12 per hour range at the time of the minimum wage hike, the direct impact on the wage level ends up being just over 0.4%.² This is joined by knock-on effects on employees earning more than €12 per hour. According to econometric estimates, these effects amount to an additional 0.4%. Recourse was taken here to the results based on the introduction of the minimum wage in 2015.³

On the whole, based on this back-of-the-envelope calculation, the minimum wage hike in autumn 2022 – excluding the impact of possible further adjustment responses in the labour market – can be expected to push up the aggregate wage bill by 0.8%. This means that the planned minimum wage hike would have a somewhat weaker impact on the aggregate wage bill than the introduction of the minimum wage in 2015. Although the group of affected employees is larger this time since

¹ Data on the number of persons for wage bins are available in the statistics of the Federal Employment Agency broken down by gross monthly earnings but not by hourly wages. At an hourly wage of €12, full-time employees would earn, in arithmetical terms, average gross wages of around €1,900 per month. For part-time employees subject to social security contributions, the minimum wage threshold would rest at a gross monthly wage of around €1,000 in arithmetical terms. Civil servants were not incorporated into the calculations.

² In this calculation, it is assumed that half of the directly affected workers receive the minimum wage of €10.45 in force at that time immediately prior to the minimum wage hike in autumn 2022 and the wages of the other half are evenly distributed in the range between that figure and €12.

³ See Hammer and Hertweck (2022). By assumption, the estimated knock-on effect is proportional to the wage impact among the directly affected employees.

the minimum wage bites more deeply into the wage distribution, the average percentage increase in gross hourly wages will probably be smaller than in 2015.

In order to quantify the macroeconomic impact of the minimum wage hikes, in simulations run using the Bundesbank's macroeconomic model, gross hourly wages were increased by 0.8% relative to the baseline, starting in the fourth quarter of 2022.⁴ Higher wage costs cause consumer prices to increase gradually. Annual average prices for 2024 are around one-and-a-half-tenths of one percent above the baseline.⁵ After four years, they are likely to be around one-quarter percent higher.⁶ Another impact of the wage hike is that households see an increase in their disposable income and step up their real consumer spending.⁷ Following the minimum wage hike, therefore, real gross domestic product initially rises marginally above the baseline. Higher domestic production costs, on the other hand, dampen price competitiveness. Real exports consequently fall below their initial level. This thus makes up for the small positive impact of domestic demand on gross domestic product.

The macroeconomic impacts of the minimum wage hike are based on the estimated elasticities of the macroeconomic model. Since the minimum wage hike was announced well in advance, the higher wage costs could be passed through to consumer prices more quickly than suggested by the model elasticities. In the current environment of higher inflation rates, firms' rising production costs could also be reflected in consumer prices more strongly than in the past.

Impact of raising the minimum wage to €12*

Deviation from the baseline (%)

Item	2023	2024
Gross wages and salaries ¹	+ 0.84	+ 0.89
Total number of hours worked	- 0.29	- 0.19
Real GDP	+ 0.02	- 0.01
HICP	+ 0.06	+ 0.14

* Based on a simulation using the macroeconomic model and on an assumed increase in the minimum wage as of 1 October 2022. ¹ Including endogenous feedback effects. Per hour worked.

Deutsche Bundesbank

⁴ The size of the shock to gross hourly wages is derived from the 0.8% wage bill effect described above. Hours worked remain, by assumption, initially unchanged.

⁵ 2024 represents the end of the horizon of the Bundesbank's latest macroeconomic projections, which have been used as the baseline. See Deutsche Bundesbank (2021a).

⁶ The long-run elasticity of consumer prices to wage changes of around 0.3 also corresponds more or less to the results presented in Deutsche Bundesbank (2019).

⁷ Although, owing to the higher wage costs, firms reduce their demand for labour to a certain degree, this only partly makes up for the aggregated income effects via higher hourly wages.

Import, export, producer and consumer prices

Deutsche Bundesbank

factor was that energy prices picked up substantially over the course of the year. Prices for non-energy industrial goods and services also accelerated unexpectedly sharply, especially from mid-year onwards. This was due to high price pressures in upstream stages of the supply chain resulting from pandemic-related supply bottlenecks, increased transport costs and higher commodity prices. Given the high demand, this was passed through to consumers. This meant that the rate excluding energy and food also rose significantly (from 0.7% to 2.2%). Overall, the rate of inflation in 2021 was above average, even excluding one-off effects such as the VAT base effect. By contrast, the of-

ficial consumer price statistics suggest that the increase in rents was similarly moderate as in the previous year, at 1.3% (for developments in housing prices in 2021, see the box on pp. 57 f.).

At the beginning of 2022, consumer price momentum picked up again substantially. Energy prices, in particular, rose strongly owing to considerably higher prices for gas and electricity, though prices of other HICP components also continued to rise on a broad basis. In a year-on-year comparison, the inflation rate therefore declined only relatively little, from 5.7% in December to 5.1% in January, despite the elimination of the VAT base effect.⁴ Core inflation, too, was still well above its long-term average in January, at 2.8%. In the coming months, inflationary pressures are likely to remain high, given the considerable price increases in upstream stages of the supply chain.

High price increases continued on a broad front in January

Order books and outlook

German economic output is likely to contract markedly again in the first quarter of 2022. This is due to the resurgence of the pandemic caused by the Omicron variant. In contrast to previous waves of the pandemic, the services sector is unlikely to be the only sector to see activity impaired by containment measures and behavioural adjustments. In fact, working hours lost due to the pandemic could also have a distinctly dampening effect on economic output – in other sectors, too.⁵ Nevertheless, positive effects are expected from the industrial

In the first quarter of 2022, economic output is likely to contract markedly again

⁴ The Federal Statistical Office conducted its regular update of the HICP expenditure weights in January 2022. In view of the coronavirus pandemic, it again used more up-to-date data sources than usual (see Federal Statistical Office (2022)). Overall, the changes were more moderate than a year earlier (see Deutsche Bundesbank (2021c)). This was evident, inter alia, in a smaller difference between the January HICP rate and the national consumer price index (CPI), which is designed such that weights are not updated (January rate: 4.9%).

⁵ According to a flash poll conducted by the Association of German Chambers of Industry and Commerce (DIHK) among 370 firms, one in four firms recently reported suffering from considerable staff shortages. See Association of German Chambers of Commerce and Industry (DIHK) (2022).

Housing prices in Germany in 2021

Housing price growth accelerated considerably last year, with housing in non-urban regions, too, likely to have become significantly more expensive. Alongside the price effects of the persistently high demand for housing, the costs of materials for new housing rose substantially owing to delivery bottlenecks, amongst other factors. Nonetheless, the housing supply grew strongly. Given weaker developments in some fundamentals, overvaluations in the housing market rose during the reporting year.¹

In Germany as a whole, residential real estate prices rose by 11.3%, according to data provided by the Association of German Pfandbrief Banks (vdp). The housing price index of the Federal Statistical Office likewise rose strongly on an average of the first three quarters of 2021, at 10.6% over the same period a year earlier. Hypoport AG's Europace house price index (EPX) likewise indicates strong rates of increase in housing prices in 2021, at 12.8%. All three indicators are thus showing the highest rate of price increase since the beginning of the recent upswing in the residential property market.

In 2021, housing prices in urban areas rose perceptibly. According to calculations based on bulwiengesa AG data for 127 German towns and cities, prices were up by 7%, thus picking up at a somewhat accelerated pace relative to the two previous years, in which growth rates had moderated. In the seven major cities, the rate of price increase was only slightly higher, at 7½%.² According to vdp data, too, housing inflation picked up in the seven major cities, but was below that of Germany as a whole.

There was hardly any acceleration in the increase in rents for new tenancies in the reporting year. Calculations based on bulwiengesa AG data indicate a 2½% rise in the price of rents for new tenancies in

towns and cities. In the seven major cities, rents rose only marginally faster, at 2¾%. According to vdp data, rents for new lettings in Germany as a whole picked up somewhat more sharply than in the seven major cities.

The key determinants of demand in the housing market developed only moderately in the reporting year. Disposable income rose by a modest 1.8% after hardly rising at all in 2020. However, there are few signs of economic growth remaining permanently stunted by the pandemic, and the labour market has thus far rebounded quickly and strongly from the coronavirus crisis.³ The interest rate on mortgage loans averaged across all lock-in periods remained virtually unchanged at its all-time low of 1.3% in 2021. Adjusted for longer-term inflation expectations, the interest rate dropped marginally, following two years in which it had already moved slightly into negative territory. Since income growth lagged behind property price rises and interest rates provided no meaningful relief, affordability deteriorated in light of the sharp rise in prices.⁴

Expansion of the housing supply made progress in the reporting year, though the pace was curbed by pandemic-induced bottlenecks in deliveries of intermediate goods. Shortages of commodities and building materials drove up the costs of materials for

¹ This box deals with residential property price developments in the context of the real economy. For more on the financial stability aspects of residential real estate financing, see Deutsche Bundesbank (2021d).

² The seven major cities are Berlin, Cologne, Düsseldorf, Frankfurt am Main, Hamburg, Munich and Stuttgart.

³ See Deutsche Bundesbank (2021e).

⁴ See the Bundesbank's system of indicators for the German residential property market, which is available at <https://www.bundesbank.de/en/statistics/sets-of-indicators/system-of-indicators-for-the-german-residential-property-market/system-of-indicators-for-the-german-residential-property-market-795268>

Price indices for housing

2010 = 100, annual data, log scale

 Deutsche Bundesbank

construction work by a massive 13.4% in the third quarter of 2021 as compared to the same period a year earlier. Calculated excluding value added tax (VAT), construction prices in the reporting year rose at a highly accelerated rate of 7.7%.⁵ Despite the bottlenecks in the construction sector, the additional supply is likely to reach the previous year's number of building completions, when just under 310,000 housing units were added. At an estimated 380,000, the number of construction permits was higher than a year earlier.

Housing price overvaluations increased in the reporting year. Owing to the, in some cases, still uncertain longer-term impacts of the pandemic – such as on disposable incomes – and looking at the exceptionally strong rises in construction prices, assessing housing prices is currently fraught with a particularly great degree of uncertainty. According to current estimates, in 2021 real estate prices in urban areas were between 15% and 40% above the level suggested by the socio-demographic and economic fundamentals.⁶ In the reporting year, the price-rent ratio for housing units in towns and cities was just over 30% above its longer-term mean, and in the seven major cities, around 40% above its longer-term mean. According to evaluations of the indicators that are currently available for the reporting year, price deviations were up considerably for Germany as a whole, too. Both in terms of the price-income ratio and according to estimation results for the long-run relationship between real estate prices, incomes and interest rates, housing prices in Germany stood at between 20% and 35% above the benchmark.⁷

5 Including the VAT hike in January 2021, construction prices rose by 9.1% in the reporting year.

6 For an explanation of the underlying panel estimation approach used, see Deutsche Bundesbank (2020a).

7 For an explanation of the valuation approaches used, see Deutsche Bundesbank (2020b).

sector. Here there are signs of a further easing of supply bottlenecks, and demand for industrial products remains high. The percentage of manufacturing firms to see output curtailed by delivery bottlenecks according to ifo Institute surveys declined distinctly in January. Manufacturing firms also had markedly higher production plans and export expectations than in the fourth quarter of 2021.

Sentiment among businesses recently improved again for the first time in some time

The ifo business climate index picked up again somewhat in January, for the first time since mid-2021. Business expectations even improved significantly in most sectors. They fell short of the average for the fourth quarter only in the main construction industry. By contrast, businesses took a worse overall view of the current business situation than a quarter earlier, with only manufacturing bucking this trend. The main reason for the muted assessment of the situation in the services sector and in wholesale and retail trade is likely to be the rise in infection rates as a result of the Omicron wave. In manufacturing, meanwhile, a let-up in disruptions to supply chains is likely to have had a positive impact.

Industrial orders down due to a lack of large orders but still at a high level

Industrial orders fell steeply on the quarter in the fourth quarter of 2021, mainly because relatively few large orders were received. Excluding large orders, however, demand rose slightly. Broken down by sector, the volume of orders received by manufacturers of capital goods dropped steeply. Demand for motor vehicles and motor vehicle parts rose markedly, however. Orders of intermediate goods fell slightly. By contrast, new orders received by producers of consumer goods rose sharply. Broken down by region, demand from non-euro area countries fell significantly. Domestic orders dropped slightly. The inflow of orders from the euro area picked up slightly. Despite the decline, industrial orders were still considerably higher than the pre-crisis level measured in the fourth quarter of 2019. Especially when compared with industrial output, which is still well below its pre-crisis level, demand for German industrial goods remains high. The reach

Demand for industrial goods and construction services

Volumes, 2015 = 100, seasonally and calendar adjusted, quarterly data

Source of unadjusted figures: Federal Statistical Office. **1** Only calendar adjusted.
 Deutsche Bundesbank

of the order books in manufacturing marked a new record high in January 2022, according to ifo Institute survey results.

Construction industry remains at capacity limit

The construction industry was likely still operating at its capacity limit at the beginning of the year. New orders in the main construction industry were down significantly in October and November – the latest months for which figures are available – compared with the strong third quarter. Whilst incoming orders in public building construction rose smartly, orders fell substantially in commercial building construction and in housing construction. Incoming orders in the civil engineering industry rose somewhat. Building permits also declined somewhat from a high level. Nonetheless, the reach of the order books in the main construction industry attained a new high in January, according to ifo Institute survey data. Utilisation of equipment and machinery increased further and was consequently even further above its long-term average. The percentage of enterprises whose construction activity was hampered by a lack of staff or materials declined of late, but was still very high in a long-term comparison.

Household final consumption expenditure is likely to fall again in the first quarter. Private owners registered considerably more vehicles in January than in the fourth quarter. Nonetheless, consumer sentiment remained depressed during the reporting period, according to the results of a GfK survey. Consumption of high-contact services continues to be dampened by the pandemic. The high rates of price increase are also likely to be weighing on private consumption.

Pandemic continues to weigh on private consumption in the first quarter

In light of very strong demand, the German economy is likely to rebound robustly in the second quarter, provided the pandemic subsidies and supply bottlenecks continue to ease. Therefore, the economic outlook appears only marginally less favourable from today's perspective than anticipated in the December 2021 projections despite the heightened burdens as a result of the pandemic and the high inflation rate.⁶ While GDP growth is likely to be markedly lower in 2022, the fundamental upward trajectory of the German economy is not in doubt.

GDP likely to pick up sharply again in the second quarter, fundamental upward trajectory of the German economy as described in the December projection not in doubt

⁶ See Deutsche Bundesbank (2021a).

Public finances*

General government budget

Government finances provided strong support to economy in 2021, too; large deficit again

Last year, government finances continued to make a considerable contribution to supporting the economy during the coronavirus crisis. This was reflected primarily in high expenditure. The transfers to enterprises to compensate for lost revenue were especially sizeable, followed by wage replacement benefits (mainly short-time working benefits). Money was also spent on health protection, notably on coronavirus testing and vaccinations. Looking at gov-

ernment revenue, VAT measures, in particular, continued to play a role. On the whole, however, revenue recovered well, with taxes even surpassing the level that had been expected for 2021 prior to the crisis, after factoring out legislative changes implemented in the meantime. According to initial data, the deficit amounted to 4.3% of gross domestic product (GDP), meaning there was no year-on-year change (see the box on pp. 63 ff.). More recent data, including on tax revenue, suggest that the deficit is ultimately likely to have been markedly lower in 2021.

General government fiscal ratios and main components affecting developments*

* General government budget as defined in the national accounts. **1** For information on the breakdown, see pp. 63 ff. **2** Change in the ratio to trend GDP. **3** In 2020, these largely concern the fiscal policy measures implemented in response to the coronavirus crisis.

Deutsche Bundesbank

The deficit looks set to shrink considerably this year. The reason for this is that, in the absence of any more unpleasant surprises, the economy should continue to recover following a setback in the fourth quarter of 2021 and first quarter of 2022. Government assistance in response to the coronavirus crisis and the automatic stabilisers will therefore probably put significantly less pressure on the budget compared with 2021. What remains unclear is the extent to which new government measures will already impact the budget in 2022. As things currently stand, additional expenditure is likely to be limited.

Lower deficit in 2022 due to economic recovery and expiring coronavirus response measures

Based on current assessments, the government budget will weather the coronavirus crisis well. While deficits were high for a time, these primarily reflected the automatic effects of the economic downturn on the budget as well as the temporary coronavirus response measures. Disregarding these temporary effects, i.e. in structural terms, there are signs that the deficit

Government budget looks set to weather crisis well

* The section entitled "General government budget" relates to data from the national accounts and the Maastricht debt ratio. This is followed by more detailed reporting on budgetary developments (government finance statistics). No data are yet available for local government or the statutory health and public long-term care insurance schemes for the reporting quarter. These will be analysed in the short commentaries in upcoming issues of the Monthly Report.

German government budget still heavily shaped by coronavirus pandemic in 2021*

The German government budget closed with another high deficit in 2021. According to first reports, that deficit amounted to 4.3% of gross domestic product (GDP) – as in 2020. This box will separate temporary influences (for the most part due to the coronavirus crisis) from structural developments. A large portion of the data is still estimated and liable to revision due to elevated uncertainty in the coronavirus crisis.¹ It is unlikely that this will make for any substantive changes in the overall picture, however.

High deficit due to temporary encumbrances during coronavirus crisis

The underutilisation of macroeconomic production factors was one element contributing to the government deficit. Domestic constraints relating to coronavirus as well as supply bottlenecks affecting intermediate goods and raw materials persisted. Through the automatic stabilisers, this resulted in an estimated cyclical burden amounting to 1¼% of GDP, which was the same as the previous year.

* See Deutsche Bundesbank (2006) for notes on the analytical approach used here. The analysis refers to data from the national accounts.

¹ Revisions to the first round of national accounts figures are expected for taxes, for instance: cash inflows from tax revenue in 2021 are significantly higher than expected in November 2021's official tax estimate. The November estimate is usually based on the first national accounts figures. Another point is that estimating the structural values necessarily involves making assumptions about how the economy will develop, an exercise made considerably more difficult by the coronavirus crisis. Furthermore, it is not possible to precisely pinpoint all of the temporary coronavirus response measures and effects.

² Expenditure on short-time working benefits is largely included in the category of cyclical influences (similarly to employment benefit I). By contrast, relief for enterprises from having to pay social security contributions for short-time workers is counted as part of the special temporary coronavirus response measures.

Temporary coronavirus response measures and other special temporary effects also had an impact, exerting a distinctly higher strain than last year, amounting to 3¼% of GDP.

Quantitatively speaking, support measures for enterprises accounted for the biggest dent, with bridging aid schemes playing by far the greatest role. This was aid for which enterprises of a slightly larger nature that had suffered severe declines in sales were also eligible to apply. Alongside this, the Federal Employment Agency alleviated some of the burden on firms by continuing to assume responsibility for payment of social security contributions in the event of short-time work.² The government also offset some of the losses sustained by passen-

Temporary coronavirus response measures²

As a percentage of GDP

* Bundesbank estimates. Transfers to enterprises and private households comprise all measures that provide comprehensive relief and do not entail any repayment obligation. ¹ Special tax rules that shift enterprises' tax payments along the time axis.

* The structural figures are derived by adjusting for cyclical influences and special temporary effects. **1** Change in the ratio to GDP compared with previous year. **2** The term "fiscal drag" encompasses the positive revenue effect of bracket creep in income taxation and the negative impact of the fact that specific excise duties are largely independent of prices. **3** Other current transfers receivable, sales and total capital revenue. **4** Other current transfers payable, other net acquisitions of non-financial assets and capital transfers payable.

Deutsche Bundesbank

ger transport companies. In addition, VAT on restaurant meals remained at its reduced rate. There was a material increase in healthcare spending on measures to protect against coronavirus, most notably vaccinations and testing. Spending on personal protective equipment and medicines also continued. Central government again made compensation payments to hospitals for keeping beds unoccupied, though these were somewhat lower than they had been in the previous year. In terms of the pandemic, private households received support primarily in the form of compensation for loss of earnings related to the virus but not directly due to illness; they were also aided through provision of a bonus child benefit payment, one-off payments for recipients of the basic allowance and increased benefits from the Federal Employment Agency.

Independent of the coronavirus crisis, other transitory effects weighed on the government budget. These included compensation to energy companies related to the move away from nuclear power (just under 0.1% of GDP). In addition, the Federal Constitutional Court ruled the application of the established high rate of interest on tax debts from 2018 onwards to be unconstitutional. The government is now required to repay any overpayments.³

³ Payments on the basis of court rulings of this kind are recorded in the national accounts as government capital transfers. They increase the deficit as soon as the decision enters into legal force and it is possible to gauge the reimbursements.

Moderate improvement in structural balance

The structural balance is obtained by deducting the cyclical and temporary influences described above from the unadjusted balance. Overall, there was a moderate improvement in the structural situation of government finances compared to the previous year, amounting to ½% of GDP (see the table on p. 64, item 4).⁴

The improvement was chiefly attributable to robust growth in the tax ratio. Profit-related taxes and VAT both increased strongly, their growth significantly outstripping trend growth in the macroeconomic reference variables (see item 12). Counter-vailing tax cuts, such as the partial abolition of the solidarity surcharge, were more than offset. Furthermore, additional contribution rates to health insurance institutions rose, which pushed up the social security contributions ratio slightly. Further revenues came from the national carbon pricing regime. These are recorded in the national accounts as taxes. Grants from the EU's NextGenerationEU programme increased the ratio for other revenue (see item 13).

On the expenditure side, the structurally higher revenues came up against increased expenditure on climate action in particular. This pushed up the ratios for subsidies (see item 16) and other expenditure (see item 20) in particular. The investment ratio decreased slightly, meanwhile (see item 19). Supply and implementation bottlenecks likely played a part here. It is also possible that local governments held back on investment due to uncertainty surrounding the budgetary outlook. Overall, the structural expenditure ratio held more or less steady around the level of the previous year.

Government budget broadly balanced in structural terms

The current assessment is that, in structural terms, the government budget closed 2021 broadly in balance. The unadjusted deficit is explained, for the most part, by the under-utilisation of aggregate capacity and the temporary coronavirus response measures. The structural balance ratio was barely changed against the pre-crisis year of 2019, though both the structural revenue ratio and structural expenditure ratio rose substantially.

The increase in the structural revenue ratio was in large part driven by the tax ratio. Despite hefty tax cuts, this was already back up above its 2019 pre-crisis level, exhibiting stronger growth than can be explained by legislative changes, the effects of tax progression and macroeconomic developments. It is hard to predict how permanent these increased receipts will prove against the backdrop of the determinants discussed – even if taxes are likely to work out even higher in the national accounts on the back of favourable developments at the end of the year. There is therefore a certain risk of drawing too optimistic an assessment of the structural situation of public finances at present.

⁴ When comparing with figures from the Federal Government or the European Commission, it is important to note that the temporary coronavirus response measures are part of the structural balance in those cases. This means there can be significant differences between the levels and changes seen there.

will be no more than moderate this year. This is a deterioration compared with the pre-crisis year of 2019, when a moderate structural surplus was recorded. Compared with 2019, expenditure on pensions, healthcare, long-term care and transfers to finance climate action will increase significantly. On the revenue side, legislative changes will put pressure on the government budget. For example, the solidarity surcharge was partially abolished in 2021. But the overall uncertainty stemming from the crisis also extends to the structural situation for government finances. In particular, projecting trends in tax developments is difficult in a crisis setting. Such developments depend not least on the extent to which the pandemic causes lasting harm to potential output. Based on current assessments, however, the damage to potential output is so far moderate at most.¹

Debt ratio up significantly for a time

The pandemic is also having a major bearing on the debt ratio: standing at 59% in 2019, it is likely to have increased to around 70% by the end of 2021. From 2022 onwards, however, it stands to reason that the ratio will shrink back down on account of a return to lower deficits and nominal GDP growth in the denominator. Furthermore, the debt effects of the coronavirus crisis not reflected in the deficit will probably decrease. Specifically, it is likely that debt-financed assistance loans, equity injections and higher cash reserves will be repaid or scaled back.

Do not undermine debt brake with excessive flexibility

It goes without saying that future fiscal developments will depend in part on how the governing coalition at the Federal level implements its plans. One significant factor in how government finances develop will be how the coalition applies the debt brake. If sound government finances are to be assured, fiscal rules need to be used to reliably keep government deficits in check. To this end, spending needs to be prioritised and, if necessary, revenue needs to be raised. The latest decisions on the central government budget have put off these decisions and are ultimately aimed at debt financing on a larger scale. To wit, emergency

loans taken out in 2020 and 2021 and not needed are to be used to finance future government projects after the pandemic emergency has ended. All in all, the way the debt brake is being used does not appear to be in the spirit of its intention (for more details, see pp. 70 ff.). Its binding effect could be adversely affected. There may be arguments for modifying the debt brake's design. Indeed, moderate deficits certainly pose no threat to the soundness of government finances, and the requirements of the debt brake are also sometimes stricter than what is prescribed under the EU budget rules. If a new design were to take account of these factors, a transparent and stability-oriented reform of the debt brake would be the more suitable path to take.

In the interest of a stable monetary union, too, it is important to safeguard sound government finances. This means that effective fiscal rules are also important at the European level. They need to have the effect of reliably lowering high debt ratios. While the European rules set appropriate limits for fiscal policy in principle, they often fail to fulfil their task as they are frequently applied overly flexibly and the rules often appear to be subject to political negotiations. This means there is certainly room for improvement here. In particular, the quantitative requirements for the medium-term budgetary objective should be clearer and more binding. Even then, it would still be possible to have a fiscal policy that is both future-oriented and more heavily geared towards stabilisation. Improvements in this regard would include, for example, national bad weather funds that are built up when times are good and a capped golden rule that protects government investment expenditure to an extent that it is consistent with stability.²

Debate on reforming European fiscal rules

² See Deutsche Bundesbank (2021b).

Budgetary development of central, state and local government

Tax revenue

Tax revenue recovered to large extent in 2021 from slump caused by pandemic

Year-on-year growth in tax revenue³ was strong in 2021, at 11½% (see the adjacent chart and the table on p. 68). It therefore already managed to surpass its pre-crisis level from 2019, by 3½%. While tax revenue still fell short (-2%, or -€16 billion) of the level projected in the last pre-COVID-19 estimate for 2021, this is due to legislative changes implemented in the meantime that led to lower tax revenue. Some of these were support measures adopted in response to the coronavirus crisis. That said, measures that were not connected to the coronavirus response also had a major impact (e.g. lowering the solidarity surcharge and income tax). Adjusted for all legislative changes implemented in the intervening period, tax revenue was 3% higher than estimated prior to the pandemic for 2021.

November tax estimate significantly exceeded – profit-related taxes better than expected

Revenue was considerably higher than projected in the official tax estimate of November 2021 (+€16 billion, or a revision of +2½ percentage points in the rate of change). Profit-related taxes, in particular, surprised on the upside. The more favourable level is likely to have an impact in later years, too, at least to some extent. However, uncertainty is very high, especially given the crisis setting.

Revenue rebound driven primarily by profit-related taxes and ...

Profit-related taxes saw steep year-on-year growth (+36%). They thus accounted for half of the increase in total revenue, despite their share in revenue only amounting to around one-fifth. In 2020, however, profit-related taxes had also decreased at an above average rate. Multiple factors are likely to have been responsible for the steep growth. First, corporate profits jumped back up sharply.⁴ Second, a role may have been played by the fact that enterprises could immediately offset expected losses from 2020 against profits from 2019 up to an upper limit. The tax loss carryforwards for 2021

were thus lower than they might otherwise have been. Third, there were additional payments and fewer refunds for 2020. Ultimately, profit performance seems to have been more favourable than initially expected.

VAT also made a considerable contribution to the rise in revenue. Growth in the nominal macroeconomic reference variables of private consumption, residential investment and government consumption was dynamic. In addition, the majority of tax payments deferred in 2020 are now likely to have been made. Legislative changes continued to cause large shortfalls, in all probability on a similar scale to those of the previous year.⁵ ... VAT

Wage tax rose by 4½%. Revenue growth was curbed due to the basic income tax allowance and child tax allowance being raised and the other income tax brackets being shifted to the

³ Including EU shares in German tax revenue but excluding receipts from local government taxes, which are not yet known for the year.

⁴ The fact that, according to initial figures, non-financial groups' return on sales recovered well in 2021 is one indication of strong corporate profits. See Deutsche Bundesbank (2021c), p. 57.

⁵ The financial impact of the temporary VAT cut in the second half of 2020 also made itself felt in January and February 2021. This is due to enterprises paying VAT with a lag of two months in most cases. The collection of import VAT was also deferred by six weeks in January 2021. In addition, the VAT rate cut on restaurant meals still applies.

Tax revenue

Deutsche Bundesbank

Wage tax made moderate contribution to growth; bracket creep since 2014 offset overall

right. Legislators have been shifting the income tax scale on a regular basis since 2014. The idea behind this is to prevent progressive taxation from increasing as taxpayers move into higher tax brackets due to inflation. In the absence of such adjustments, taxation of real income would continually rise in line with inflation. When the scale is shifted gradually to the right, the individual tax rates that it contains then apply as of ever higher (nominal) income brackets. Shifts in the income tax scale are based on estimated inflation rates. Inflation was unexpectedly high in 2021, and the bracket creep in 2021 will therefore be offset to only a relatively minor extent. However, the reverse had generally been the case in previous years. In 2018, 2019 and 2020, in particular, inflation turned out to be markedly lower than projected. Overall, the shifts in the scale since 2014 have been high enough to prevent bracket creep.

The latest official tax estimate of November 2021 assumes favourable revenue prospects for 2022 and beyond.⁶ In view of last year's highly favourable result, it stands to reason that the tax estimate will be even higher, with at least a portion of the additional revenue probably being carried forward as a base effect. However, revenue-reducing legislative changes that had not yet been taken into account in the tax estimate are looming on the horizon. For example, the Federal Government held out the prospect of continuing to compensate for additional, inflation-related burdens stemming from bracket creep. In addition, the change-over to deferred taxation of pensions is to be adjusted, a move made necessary following a ruling by the Federal Fiscal Court. There appear to be plans for contributions to the pension insurance scheme to be fully deductible as spe-

2022 and later years: tax outlook favourable overall, but relief measures likely to curb growth slightly

⁶ For more details on the official tax estimate, see Deutsche Bundesbank (2021d), pp. 65 ff., which also includes a comparison with the November 2019 estimate.

cial expenses from next year already (instead of from 2025). From 2023, the taxable share of pensions upon retirement is also set to increase more slowly than currently planned.⁷ In the period covered by the tax estimate, the annual tax shortfalls from this package are expected to make themselves felt in 2023 especially, before decreasing again. In addition, various coronavirus support measures are to be extended. One major factor contributing to the shortfalls is that firms will be able to accelerate their write-offs of capital equipment for a longer period – this will then also be possible for the 2022 acquisition year. Furthermore, the coalition agreement sets out accelerated write-off provisions for investments in climate and information technology. The resulting loss of revenue will depend on what form these provisions take. Risks exist in connection with the solidarity surcharge: there are questions as to whether it is still sufficiently justified given that special-purpose grants to the eastern German states have since been discontinued.

Central government budget

2021 budget result: deficit up even more and very large due to coronavirus pandemic and pre-funding of off-budget entities

The central government budget recorded a very large deficit in the second pandemic year of 2021. Provisional figures from the Federal Ministry of Finance put it at €216 billion (2020: €131 billion). Thanks to higher tax receipts, revenue returned to steep growth, rising by 8½% (+€29 billion). However, expenditure rose far more sharply still, by 24% (+€114 billion). Transfers to central government's off-budget entities alone increased by €48 billion, with inflows into the new Flood Relief Fund (€16 billion) and the Energy and Climate Fund (€62 billion, and thus €35 billion more than in 2020). Grants from central government to the social security funds went up by €38 billion. For example, central government provided significantly greater compensation for pandemic-related healthcare spending. Transfers to the Federal Employment Agency were slightly higher still (+€17 billion; see the box on pp. 73f.). Transfers to enterprises in response to the coronavirus

pandemic increased by €30 billion and reached €49 billion. Since the application and approval processes take a certain amount of time, this figure also included extensive aid to compensate for lost revenue in the previous year. Insofar as the federal states involved settled already foreseeable payments at the end of 2021, it also reflects burdens from the current year.⁸ Interest expenditure saw a renewed decrease, by €2½ billion. Sizeable premia were again collected, which are deducted from the interest

⁷ In the course of changing over to deferred taxation, the taxable share of pensions has been gradually increasing since 2005, starting at 50% and currently expected to reach the final value of 100% by 2040. The tax-free pension amount, which is usually determined on a one-time basis upon retirement, applies for the entire period over which the pension is drawn. Regular pension adjustments will thus be fully subject to taxation; see also Federal Ministry of Finance (2020).

⁸ Central government expenditure was around €4 billion higher than the payments recorded in the application statistics. For the current year, the rules for interim management of the budget set a narrow limit for such business aid from central government: 45% of the budget estimate from last summer's draft is principally available, i.e. only just over €3 billion.

expenditure. At €11 billion, though, these premia were around €1 billion lower than in 2020.

Second supplementary budget for 2021 does not take into account more favourable budget outturn figures already available

Prior to the approval of the second supplementary budget for 2021 in the Bundestag, there was an initial report on the provisional outturn for the 2021 budget.⁹ However, these figures were not factored into the second supplementary budget. Instead, the expected result from the first supplementary budget was adopted as it stood. This budgeted value was €25 billion less favourable than the provisional budget result. Estimated revenue was €9 billion lower than in the budget outturn, with tax revenue especially affected. On the expenditure side, the transfers to the Flood Relief Fund totalling €16 billion were not taken into account in the second supplementary budget. Additionally, the grant to the Federal Employment Agency was underestimated by almost €14 billion. These two factors resulted in unplanned expenditure of €30 billion. In addition, a global expenditure cut of €7½ billion on balance was budgeted.¹⁰ Nevertheless, the planned expenditure volume was €16 billion higher than actual expenditure. The main reason for this was that the estimates for business aid and other coronavirus-related spending were too high. Interest expenditure was also lower, with the estimates for premia remaining well below the provisional actual figures.

Exceptional borrowing to fund future projects – intention to lodge constitutional complaint announced

In autumn 2020, the Bundestag activated the debt brake escape clause for the 2021 budget year. Borrowing authorisations were very generous both when the budget was adopted and then again in spring 2021 for the first supplementary budget. As uncertainty was high during the crisis, the large precautionary buffers were comprehensible from an economic perspective. However, developments in the central government budget proved to be much more favourable, and a large part of the authorisations were not actually required last year. €60 billion was nevertheless used recently to pre-fund government climate protection projects in future years. To this end, the Energy and Climate Fund received transfers from the second

2021 supplementary budget. At the same time, the Bundestag decided that the debt brake would no longer apply to special funds with no borrowing authorisation of their own. This rule entered into force with retroactive effect. As a result, all reserves of these special funds can now be used without corresponding payments being limited by the debt brake (see the box on p. 71). Concerns as to whether this change is compatible with constitutional law were voiced, inter alia, at a hearing of the Budget Committee of the German Bundestag. Opponents criticised that emergency loans taken out had been set aside and repurposed.¹¹ Reference was also made to a ruling by the Constitutional Court of Hesse from 27 October 2021.¹² The opposition announced their intention to lodge a constitutional complaint.

These changes to the debt brake will mean far greater budgetary scope in the next few years. Based on the special funds' reserves, this scope amounts to €112 billion and will primarily affect the current legislative period.

Additional scope ...

- Of this figure, €69 billion comes from 2021. This corresponds to the off-budget entities' surpluses stemming from debt-financed transfers from the core budget, with the Energy and Climate Fund, in particular, and the new Flood Relief Fund making the biggest contributions. Net borrowing therefore breached the standard limit under the debt brake by a correspondingly larger amount in 2021 (see the boxes on p. 71 and pp. 73 f.). This means that recourse to the escape clause was greater.
- A further €43 billion originates from special funds' reserves that were built up from

... of €69 billion from 2021 ...

⁹ See Federal Ministry of Finance (2022a). As a planning tool, the budget plan is commonly prepared before the outturn. Information that is already available is also usually included.

¹⁰ A global expenditure cut in budget plans has to be achieved in the course of implementing the budget by making savings in individual budget items in order to meet the planned expenditure total.

¹¹ See Deutscher Bundestag (2022).

¹² See also Deutsche Bundesbank (2021d), p. 72.

Central government special funds now outside the debt brake

On 27 January 2022, the Bundestag decided that, going forward, special funds with no borrowing authorisation of their own would be treated differently under the debt brake. This applies to all special funds with no borrowing authorisation of their own and which were created after 2010.

Previously, these special funds were counted towards the debt brake: their balances (surplus or deficit) were deducted from borrowing in the core budget. As a result, it made no difference for the debt brake if a payment from the central government budget flowed to one of these special funds: this created a deficit in the core budget and an offsetting surplus in the special fund.¹ The issue for the debt brake was rather the amount that the special fund paid to third parties: this created a deficit when viewing the core budget and its special funds as a consolidated entity.² Using borrowing authorisations to provide advance financing for the Energy and Climate Fund in 2020 thus had no effect on the debt brake.

The change means that the annual borrowing limit imposed by the debt brake now applies only to the core budget (and not to the special funds). As a result, a transfer from the core budget to a special fund will have an immediate effect on the debt brake in the shape of higher net borrowing. Borrowing authorisations granted by way of exception to overcome emergencies can thus be set aside for subsequent years. Actual outflows from the special fund at a later date no longer play a role for the debt brake.

The new accounting method for special funds does not apply only as of the 2021

fiscal year – it also applies to reserves from previous years. Thus, the debt brake figures were settled again with retroactive effect. Earlier transfers to the relevant special funds therefore represent a burden in previous accounting for the debt brake. This meant that the balance on the control account also had to be recalculated: this balance consists of amounts credited for fiscal years prior to 2020. These amounts are now smaller because the transfers to special funds are now accounted for as burdens. In this respect, budget accounts that had already been closed were effectively reopened. As legally required, these budgets had previously been settled for the last time on 1 September of the following year.

The European fiscal rules include the special funds: the medium-term budgetary objective applies to the general government structural deficit. Central government therefore still needs to limit the deficits of its special funds in such a way that general government requirements are met. Additionally, the onus is on the Stability Council to work towards ensuring that the European fiscal limits are not breached.

¹ The result under the debt brake would only have been affected by payments between the core budget reserves (without being counted towards borrowing relevant to the debt brake) and a special fund. No such payments were made, however.

² When a special fund generated income from third parties, this accordingly increased the room for manoeuvre under the debt brake.

... and €43 billion from previous years

transfers in previous years. This includes pre-funding, particularly of the Energy and Climate Fund, in 2020 when the escape clause was also activated (€28 billion). The remainder comes from years further back when the escape clause was not activated. For the years back to 2016, the change in rules means that special funds' surpluses, which previously counted towards the debt brake, are no longer included. This reduced the balance on the control account, which shows a cumulated undershooting of the regular borrowing limit under the debt brake, by €4½ billion.¹³

Higher repayment obligations under debt brake, but deferral of repayments also announced

The largest chunk of this future budgetary scope (€97 billion, or 2½% of GDP) was therefore accumulated via higher emergency loans taken out in 2020 and 2021. This lowers the scope for borrowing in the repayment years. To date, repayment of the emergency loans taken out in 2020 is due between 2023 and 2042, and those taken out in 2021, between 2026 and 2042. The new accounting rules for special funds mean an annual repayment burden of €3½ billion as of 2023, rising to €15 billion as of 2026. However, the Federal Government has announced that it will revise the repayment schedules with the 2022 budget. According to the coalition agreement, the schedules are to be brought into line with the repayment deadlines for the EU's NextGenerationEU crisis fund. All repayments would then not start until 2028 and would be spread over 30 years (as opposed to the 20 years envisaged to date). The annual repayment amount for all emergency loans taken out so far would then total €8½ billion. Of these annual amounts, just over €3½ billion would be due to changing the rules for the special funds. Additional interest payments would inflate the burdens further.

Approach appears incompatible with intention of debt brake

All in all, the way the debt brake is being used does not appear to be in the spirit of its intention. This applies to the use of the escape clause, in particular. Activation of the escape clause is predicated on a particular crisis situation, one that is beyond the government's

control and impacts significantly on the state's financial position. For 2020 and 2021, this was indeed the case. However, the exceptional borrowing authorisations set aside for future expenditure are not closely related to the coronavirus pandemic. They are instead being used to release future climate policy measures from the annual debt brake limits. A stimulus in demand from abolishing the renewable energy (EEG) levy is set to be financed in this way using the escape clause, too.

However, the majority of forecasts available predict that the economy as a whole will be more or less back to normal as early as 2022 or even in a more favourable condition. According to the government's projection from last autumn, employment will be higher as of 2023 and unemployment will be lower than expected prior to the outbreak of the crisis. There is no indication that macroeconomic demand requires an additional stimulus. The draft budget states that private investment dropped away in the crisis years and that measures to promote it are now necessary. However, total capital stock in the coming years is now expected to be only slightly lower than levels forecast before the crisis and a catch-up process already appears to be under way. No economic justification was presented stating that a moderate undershooting of previous expectations constitutes a real crisis situation that can only be overcome with emergency borrowing. The simple fact that certain measures appear essential is not sufficient to justify funding them with stockpiled emergency loans. The aim of the debt brake is rather to make sure priorities are set – irrespective of whether on the revenue or the expenditure side.

As things stand today, acute phase of crisis overcome

Under the debt brake, even before an emergency loan can be taken out, a repayment schedule must be agreed. This is to prevent a situation whereby the escape clause is used to

Question retro-active adjustment of agreed repayment schedules

¹³ For the years prior to 2016 (before the borrowing limit of 0.35% of GDP came into force), the credit balance on the control account was cancelled. The remainder was not offset.

Provisional accounting for central government's debt brake for 2021

In the initial accounting for last year,¹ the Federal Ministry of Finance took into account the new rule for special funds. The results for previous years were also adjusted accordingly.

In 2021, the standard limit was exceeded by a total of €193 billion. This limit stood at

€12 billion (0.35% of gross domestic product in 2019). Net borrowing came to €215 billion. To compute the key structural figure, the calculated cyclical burden of €14 billion was deducted from this and the balance of financial transactions, which stood at +€3

¹ See Federal Ministry of Finance (2022b).

billion, was added. The calculation of financial transactions for the 2021 accounting is consistent with the spirit of the debt brake: the deficit-offsetting payments to the Federal Employment Agency, which were counted as loans only during the year, were reclassified as grants before the books were closed. Thus, loans amounting to €17 billion that were granted and reported as financial transactions during the year were not included here. The surplus from financial transactions, which has a negative impact on the structural balance, is based on the counting of a Federal Employment Agency debt of €7 billion which central government forgave. The agency had received this loan in 2020 to offset its deficit. Previously, the rulebook on central government's debt brake stipulated that financial transactions are to be counted in accordance with budget accounting.² Debt forgiveness represents a burden on central

government finances without a payment transaction, however. Thus, the counting of forgiven debt is consistent with the spirit of the debt brake.

² See Federal Ministry of Finance (2021), p. 18. For recording options then possible for central government transactions to offset deficits of the Federal Employment Agency, see Deutsche Bundesbank (2021d), p. 69.

build up additional debt on a permanent basis. The repayment schedule is there to ensure a reliable commitment to scaling back debt. Early repayment is not actually required from an economic perspective, as the debt ratio is set to come down and the interest burden is low. However, removing repayment from the upcoming medium-term planning to generate scope for new projects in non-crisis situations could potentially weaken the binding effect of the debt brake. This binding effect is crucial if the debt brake is to reliably ensure sound government finances. Moreover, it is essential to not lose sight of the fact that future government budgets will also have to bear the strain of demographic change. Burdens are thus not being shifted to years where the fiscal situation is likely to be relaxed. As of 2028, repayments of European debt from the NextGenerationEU programme will also weigh on the budget.

The new Federal Government is planning on presenting a revised draft budget for 2022 on

9 March. Net borrowing is not expected to exceed the €100 billion originally planned. On the one hand, the underlying more favourable budgetary development suggests relief compared to previous plans for 2022 as well. On the other hand, the additional costs from the coalition agreements need to be taken into account.

If the government wants to exceed the regular ceiling for net borrowing, it will again have to take recourse to the escape clause. This requires presenting justification that the crisis situation persists and continues to place a significant strain on government finances. However, despite the ongoing presence of the coronavirus, the projections available do not indicate that the economy as a whole is still in a state of crisis. Some coronavirus response measures remain in place. However, central government has a general reserve of €48 billion. This reserve was topped up prior to the crisis with surpluses recorded in the 2015 to 2019

Underlying trend for 2022 central government budget much more favourable, but additional costs from new projects

Renewed recourse to escape clause requires extensive justification

budget years. Coronavirus-related budgetary burdens could be financed from the reserve without having to activate the escape clause. Extensive justification – detailing why emergency loans are needed and for which concrete measures specifically – would therefore be required before more of these loans could be taken out.

Central government's off-budget entities post very high surplus due to pre-funding

Central government's off-budget entities (excluding the Financial Market Stabilisation Fund (SoFFin), bad banks and other entities that use commercial double-entry bookkeeping) closed 2021 with a very high surplus.¹⁴ Large transfers from the core budget were the major driving force, pushing the surplus up to €76 billion, after a deficit of €6 billion the year before. The Energy and Climate Fund made the largest contribution (surplus of €54 billion) to the result for the year. Outflows from this fund were still much lower than planned, but not by as much as in the previous year. The new Flood Relief Fund disbursed only just under €½ billion, putting its surplus at almost €16 billion. Despite paying out €6½ billion in new coronavirus assistance loans, the Economic Stabilisation Fund still posted a surplus of just under €2 billion, stemming primarily from repayments of loans and capital assistance for enterprises such as Lufthansa. This surplus came after a deficit of €40 billion last year, resulting chiefly from refinancing the KfW's coronavirus assistance loans.

Surplus possible in 2022 due to repayments to Economic Stabilisation Fund

The Energy and Climate Fund could achieve a roughly balanced budget for 2022 as a whole. While the Federal Government is striving to make greater use of this fund, current plans to abolish the renewable energy (EEG) levy on the electricity price before 2023 might only have a minor impact on it. In the four months since the EEG levy for 2022 was calculated, the balance on the EEG account has risen by €8 billion, and high electricity prices are expected to continue to significantly rein in the need for grants for eligible electricity producers. The new Flood Relief Fund is likely to have much higher outflows than last year, and no additional injection of funds is planned at present.

Regarding the Economic Stabilisation Fund, by contrast, the application period for aid measures ends in mid-2022 and the credit facility for loans has been cut back extensively. Due to a favourable outlook for macroeconomic development, take-up of new aid measures could be rather low. Given that financing conditions for enterprises are still attractive, repayments may considerably outweigh outpayments. Under these circumstances, it is even possible that central government's off-budget entities will again close the year in surplus.

State government budgets¹⁵

State government core budgets posted a slight surplus of €1 billion for 2021, compared with a very high deficit of €39 billion one year previously. Data for state government off-budget entities are not yet available. Based on figures for the first three quarters, a slight deficit is emerging.¹⁶ Including their off-budget entities, the federal states are likely to have attained a roughly balanced budget in 2021.

State government core budgets post slight surplus in 2021

Revenue in the core budgets rose by 10% over the year as a whole. This was primarily due to

¹⁴ According to figures from the Federal Ministry of Finance. The Ministry does not publish quarterly data for off-budget entities that keep commercial accounts, such as the bad bank FMS Wertmanagement. The deficit generated by SoFFin, which uses a single-entry accounting system, has also been excluded. Since 2019, SoFFin has been taking out loans and lending these funds to FMS Wertmanagement, which uses them to refinance legacy debt. Overall, therefore, SoFFin's deficit does not increase central government's consolidated debt level.

¹⁵ The data on state government core budgets in the reporting quarter are based on the Federal Ministry of Finance's monthly cash statistics.

¹⁶ According to the quarterly figures, a consolidated deficit of €½ billion was recorded after three quarters (with advance payments of staff costs recorded using the accruals method). The surplus in the core budgets was countered by the deficit in the off-budget entities. According to the monthly statistics, data on core budgets in the fourth quarter do not reveal any notable payment flows between the core budgets and the off-budget entities. It is therefore possible that the off-budget entities' balances were largely stable. However, the data do not yet include €2 billion to pre-fund Saxony-Anhalt's coronavirus special fund, which was set up at the end of 2021, for instance. More comprehensive data are likely to be available at the end of the current quarter.

Strong growth in tax revenue and moderate rise in expenditure

the strong growth in tax revenue (+13%), which was 3% above the revenue level projected in the pre-crisis official tax estimate for 2021. This means that tax revenue was no longer suffering the effects of the crisis. Receipts from public administrations, a large revenue item, continued to increase (+4%) despite the substantially elevated prior-year basis. Total expenditure rose only slightly (+1½%). Although there was perceptible additional spending on the running of vaccination centres and coronavirus testing at schools, reduced inflows to state government coronavirus special funds appear to have had a dampening effect.

State government budgets probably largely unchanged this year

After improving greatly in 2021, state government finances are likely to remain largely unchanged this year. Following last year's strong recovery, tax revenue will probably grow only moderately. Transfers from central government are likely to see a significant reduction due to the expiry of pandemic response measures funded by central government. Fundamentally,

this does not place a net financial burden on the state governments, as they are also spending less on such measures. However, the funds received from central government appear to have exceeded the corresponding state government expenditure at the end of 2021. If some of the central government funds received in 2021 have been spent with a delay, this will have a negative impact on the balance for 2022. In addition, personnel expenditure is likely to rise markedly. While the state governments will probably discontinue most of the special coronavirus aid accruing to their local governments, regular payments made under local government financial equalisation schemes could increase. Although pandemic-related administrative expenses (primarily coronavirus tests at schools) will probably continue to rise significantly at first, they should decline as the pandemic ebbs.

All in all, the remaining coronavirus-related burdens are likely to be of a manageable size. It would therefore seem inappropriate for state governments to activate their debt brake escape clauses or tap reserves built up using prior emergency loans. Rhineland-Palatinate, for example, has been back in compliance with its regular debt limit since last year. Other federal states have also already announced that they will revert to their normal rules and begin making repayments in 2022. Lower Saxony, for instance, intends to repay debt from loans it took out on the basis of cyclical developments. Thuringia, meanwhile, is starting to pay off its emergency loans this year. Some state governments probably took out more emergency loans than they need to tackle the pandemic. In that case, it would seem appropriate for these governments to promptly repay loans used to build reserves. Using these funds for other purposes would not comply with the spirit of the debt brake.¹⁷

No longer appropriate for state governments to activate escape clauses in 2022

¹⁷ See Deutsche Bundesbank (2021e), pp. 38 f.

■ Social security funds

Pension insurance scheme

Surplus in 2021 due to central government funds for as yet unpaid basic pension benefits

According to preliminary data, the statutory pension insurance scheme recorded a surplus of almost €1 billion in 2021. This constituted a substantial improvement on 2020, when the scheme posted a deficit of almost €4½ billion. The surplus is ultimately due to a one-off effect relating to the basic pension: central government already transferred its full grant of €1½ billion last year. This grant is intended, initially, to broadly offset the annual additional benefits paid out by the scheme. However, only a small portion of the entitlements arising in 2021 have yet been disbursed.¹⁸ As a result of the surplus, the sustainability reserve swelled to €39 billion at the end of 2021 (just over 1.6 times the scheme's monthly expenditure), leaving it around €34 billion above the statutory minimum of 0.2 times the scheme's monthly expenditure.

Revenue increased significantly, spending dynamics subdued

On the revenue side, contribution receipts rose by 4%. At 4½%, the increase in central government funds was somewhat larger, with 1½ percentage points being attributable to the additional central government funds for the basic pension. Expenditure growth was much weaker, at 2½%. This was primarily because pensions were not raised in western Germany in mid-2021 (eastern Germany: +0.7%). On average across the year, pensions increased by a total of 2%. By contrast, the number of pensions again saw only moderate growth.

Significant deficit on the cards for 2022

This year, expenditure will rise more rapidly than revenue, meaning that a significant deficit is on the cards. Growth in central government funds will be subdued, as they are rules-based and tied to the weak wage developments of 2020. The fact that pensions barely rose in 2021 will continue to have a dampening effect on expenditure in the first half of the year. However, the pension increase in mid-2022 is likely to be very high. Alongside the current basic pension top-ups, moreover, the scheme

Finances of the German statutory pension insurance scheme*

Source: German statutory pension insurance scheme (Deutsche Rentenversicherung Bund). * Preliminary quarterly figures. The final annual figures differ from the total of the reported preliminary quarterly figures as the latter are not subsequently revised.
 Deutsche Bundesbank

will also have to make back-payments for 2021. That alone will probably worsen the annual result by around €2½ billion given that benefits for 2021 are being paid out with a delay.

In spring, the Ministry of Labour calculates how high the pension adjustment will be at mid-year. In the pension insurance report of autumn 2021, the Ministry still assumed that the in-

¹⁸ The pension insurance scheme expects that the last basic pensions from 2021 will only be paid out by the end of 2022.

Finances of the Federal Employment Agency*

 Deutsche Bundesbank

Planned reactivation of the catch-up factor will only slightly dampen pension increase

increase would come to an average of 5½%.¹⁹ However, the new Federal Government is planning to reactivate the catch-up factor in the pension adjustment. As things stand, this factor is deactivated up to and including 2025. Once the factor is reactivated, the pension cut that was waived in 2021 on account of the safeguard clause will be recouped. The waived cut will be offset against the annual pension increases, meaning that pensions will not fall but will merely rise somewhat more slowly. According to the coalition agreement, however, the statutory pension level is to be redefined at the same time. This currently stands at 49.4%; the planned change would bring it down to

48.3%.²⁰ The redefinition will not change pensions initially. The lower statutory pension level will affect the pension adjustment, however. As the pension level is not permitted to fall below 48%, the catch-up factor will have only a minor impact. Pensions thus remain likely to rise steeply in mid-2022.

Last year's pension insurance report outlines the upcoming financial pressures – which will not be substantially eased by the changes described above. According to the report, the contribution rate will leap from the current figure of 18.6% to 19.5% in 2024, before climbing to 19.7% in 2025. The pension level in 2025 will be almost unchanged, at 49.2% (48% following the redefinition of the statutory pension level and reactivation of the catch-up factor). The growing financial pressures will continue to make their presence felt after 2025: up to 2035, the contribution rate will rise continuously to almost 22½%. The statutory pension level will fall to just under 46% (45% under the new definition). The new Federal Government now intends to ensure a statutory pension level of 48% beyond 2025, too. This would subject the pension insurance scheme to significant additional financial pressures. Consequently, contribution rates would be likely to increase even further. As the bulk of the central government transfers to the scheme rise along with the contribution rate, the central government budget would also come under greater strain. This strain will grow even further if central government caps the rise in the contribution rate through additional grants.

Stabilisation of the statutory pension level would intensify financial pressures already on the horizon

¹⁹ The report puts the pension adjustment for western Germany at just over 5% and that for eastern Germany at 6%. This strong increase is due primarily to the wage growth seen in 2021, which was intensified by the decline in short-time working. In addition, there will be a retroactive upward correction for developments in 2020: the relevant earnings subject to compulsory contributions probably increased significantly more strongly than the wages that the 2021 pension adjustment was based on. For more detailed information, see Deutsche Bundesbank (2020).

²⁰ A statistical one-off effect involving earnings subject to compulsory contributions increased the statutory pension level in 2021 by around 1 percentage point. With the planned change, this effect will be eliminated again.

Federal Employment Agency

Another very large deficit due to the crisis

In 2021, the Federal Employment Agency again played a significant role in stabilising the economy: due to the crisis, it posted a deficit of €22 billion (compared with €27 billion in 2020) before receipt of the central government grants.²¹ Excluding the surpluses from insolvency benefit contributions and winter employment compensation contributions, the deficit came to €23 billion. The Federal Employment Agency partly offset the deficit with its reserves of €6 billion.²² In addition, central government issued intrayear loans of €17 billion. At the end of the year, it converted these loans into a grant.

Robust revenue growth due to increased contribution receipts and higher contributions for insolvency benefit payments

The Federal Employment Agency's revenue (excluding the central government grant to offset the deficit) grew robustly by 6½%. Contribution receipts increased by just over 4½%. This was connected, not least, to the renewed rise in employment. A year earlier, the contribution base had declined by 1½% due to the crisis. Growth in revenue from insolvency benefit contributions was exceptionally strong given that the contribution rate had doubled to 0.12%.²³

Lower expenditure due to reduced short-time working and improved labour market situation

Expenditure fell by 5½%, though was still 75% above the pre-crisis level of 2019. Given the improved labour market situation, spending on unemployment benefits declined (-5½%). The Federal Employment Agency's expenditure on short-time working was down by 7½% on the year, although it still amounted to €21 billion. €8 billion of this was spent on social security contributions, via which the Federal Employment Agency is providing enterprises with pandemic-related relief. Insolvency benefit

dropped by 60% from the elevated level recorded a year earlier. Despite exemptions from the obligation to file for insolvency having expired at the end of April 2021, insolvency benefit hit its lowest level in more than 20 years.

The Federal Employment Agency's finances should improve significantly this year. Its budget plan, approved in December, envisages a deficit of €1½ billion in the core budget. This deficit is to be offset by a central government grant. On the revenue side, contribution receipts are projected to increase by a considerable 4%. The insolvency benefit contribution rate was lowered to 0.09%. On the expenditure side, the budget plan envisages a sharp decline in spending on unemployment benefits and short-time working benefits. However, coronavirus infection rates have gone back up since the budget plan was put together. This means that pandemic-related burdens will probably ease off more slowly than projected. The Federal Government has since partially extended the pandemic-related special arrangements until the end of June 2022. All in all, the agency's finances are likely to develop somewhat less favourably than planned.

Small deficit planned for 2022 – offset by central government grant

²¹ In the core budget, i.e. excluding the civil servants' pension fund. Transfers to the fund are recorded as expenditure, lowering the core budget balance. These transfers were suspended in 2021 (as previously during 2020) because of the coronavirus crisis. As a result, the fund posted a deficit of €½ billion. Its reserves declined to €8½ billion at the end of the year.

²² Consequently, the Federal Employment Agency no longer has any reserves available to it in the contribution-funded unemployment insurance scheme. The insolvency benefit and winter employment compensation reserves, which are funded by specific levies, came to a combined total of just over €2½ billion at the end of 2021 (up €1 billion on the year).

²³ This brought the contribution rate up to its 2010-2020 average.

of paper issued by euro area MFIs. ⁹ Including national banknotes still in circulation. ¹⁰ The German contributions to the Eurosystem's monetary aggregates should on no account be interpreted as national monetary aggregates and are therefore not comparable with the erstwhile German money stocks M1, M2 or M3. ¹¹ The

difference between the volume of euro banknotes actually issued by the Bundesbank and the amount disclosed in accordance with the accounting regime chosen by the Eurosystem (see also footnote 2 on banknote circulation in Table III.2).

euro banknotes put into circulation by the Bundesbank in accordance with the accounting regime chosen by the Eurosystem (see also footnote 2 on banknote circulation in Table III.2). The volume of currency actually put into circulation by the

Bundesbank can be calculated by adding to this total the item "Intra-Eurosystem liability/claim related to banknote issue" (see "Other liability items"). ⁵ Excluding central governments' deposits. ⁶ In Germany, only savings deposits.

* Monetary financial institutions (MFIs) comprise banks (including building and loan associations), money market funds, and the European Central Bank and national central banks (the Eurosystem). ¹ Source: ECB. ² In Germany, only savings deposits. ³ Excluding holdings of MFIs; for the German contribution, excluding German MFIs' portfolios of securities issued by MFIs in the euro area. ⁴ In Germany, bank debt securities with maturities of up to one year are classed as money market paper.

⁵ Excluding liabilities arising from securities issued. ⁶ After deduction of inter-MFI participations. ⁷ The German contributions to the Eurosystem's monetary aggregates should on no account be interpreted as national monetary aggregates and are therefore not comparable with the erstwhile German money stocks M1, M2 or M3. ⁸ Including DEM banknotes still in circulation (see also footnote 4 on p. 10*). ⁹ For the German contribution, the difference between the volume of euro banknotes

2022 Jan.

Discrepancies may arise from rounding. * The banking system's liquidity position is defined as the current account holdings in euro of euro area credit institutions with the Eurosystem. Amounts are derived from the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. ¹ Figures are daily averages for the reserve maintenance period ending in the month indicated. Following the changeover in the frequency of Governing Council monetary policy meetings to a six-week cycle, a reserve maintenance period no longer ends in every month. No figures

are available in such cases. ² Source: ECB. ³ Includes liquidity provided under the Eurosystem's asset purchase programmes. ⁴ From August 2009 includes liquidity absorbed as a result of the Eurosystem's foreign exchange swap operations. ⁵ From 2002 euro banknotes and other banknotes which have been issued by the national central banks of the Eurosystem and which are still in circulation. In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is

allocated to the ECB on a monthly basis. The counterpart of this adjustment is shown under "Other factors". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly basis, to the NCBS, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro banknotes allocated to an NCB and the value of the euro banknotes which that NCB has put into circulation is likewise shown under "Other factors". From 2003 euro

banknotes only. ⁶ Remaining items in the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. ⁷ Equal to the difference between the sum of liquidity-providing factors and the sum of liquidity-absorbing factors. ⁸ Calculated as the sum of the "Deposit facility", "Banknotes in circulation" and "Credit institutions' current account balances".

III. Consolidated financial statement of the Eurosystem

1. Assets *

€ billion

As at reporting date	Total assets	Gold and gold receivables	Claims on non-euro area residents denominated in foreign currency			Claims on euro area residents denominated in foreign currency	Claims on non-euro area residents denominated in euro			
			Total	Receivables from the IMF	Balances with banks, security investments, external loans and other external assets		Total	Balances with banks, security investments and loans	Claims arising from the credit facility under ERM II

* The consolidated financial statement of the Eurosystem comprises the financial statement of the European Central Bank (ECB) and the financial statements of the national central banks of the euro area Member States (NCBs). The balance sheet items for foreign currency, securities, gold and financial instruments are valued at market

rates at the end of the quarter. ¹ In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is allocated to the ECB on a monthly basis. The counterpart of this adjustment is disclosed as an "Intra-Eurosystem liability related to

III. Consolidated financial statement of the Eurosystem

Liabilities to non-euro area residents denominated in euro	Liabilities to euro area residents in foreign currency	Liabilities to non-euro area residents denominated in foreign currency			Counterpart of special drawing rights allocated by the IMF	Other liabilities 2	Intra-Eurosystem liability related to euro banknote issue 1	Revaluation accounts	Capital and reserves	As at reporting date

euro banknote issue". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly basis, to the NCBs, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro

banknotes allocated to the NCB according to the aforementioned accounting procedure and the value of euro banknotes put into circulation is also disclosed as an "Intra-Eurosystem claim/liability related to banknote issue". 2 For the Deutsche Bundesbank: including DEM banknotes still in circulation. 3 Source: ECB.

IV. Banks

1. Assets and liabilities of monetary financial institutions (excluding the Deutsche Bundesbank) in Germany *

* This table serves to supplement the "Overall monetary survey" in Section II. Unlike the other tables in Section IV, this table includes - in addition to the figures reported by

banks (including building and loan associations) - data from money market funds.
1 See footnote 1 in Table IV.2. 2 Excluding deposits of central governments.

IV. Banks

in other Member States ²				Deposits of central governments		Liabilities arising from repos with non-banks in the euro area	Money market fund shares issued ³	Debt securities issued ³		Liabilities to non-euro area residents	Capital and reserves	Other Liabilities ¹	Period
With agreed maturities		At agreed notice		Total	of which: domestic central governments			Total	of which: with maturities of up to 2 years ³				
Total	of which: up to 2 years	Total	of which: up to 3 months

³ In Germany, debt securities with maturities of up to one year are classed as money market paper; up to the January 2002 Monthly Report they were published together

with money market fund shares. ⁴ Statistical breaks have been eliminated from the flow figures (see also footnote * in Table II.1).

IV. Banks

2. Principal assets and liabilities of banks (MFIs) in Germany, by category of banks *

€ billion

End of month	Number of reporting institutions	Balance sheet total ¹	Cash in hand and credit balances with central banks	Lending to banks (MFIs)			Lending to non-banks (non-MFIs)					Participating interests	Other assets ¹
				Total	of which:		Total	of which:			Securities issued by non-banks		
					Balances and loans	Securities issued by banks		Loans	Bills

* Assets and liabilities of monetary financial institutions (MFIs) in Germany. The assets and liabilities of foreign branches, of money market funds (which are also classified as MFIs) and of the Bundesbank are not included. For the definitions of the respective items, see the footnotes to Table IV.3. **1** Owing to the Act Modernising Accounting Law (Gesetz zur Modernisierung des Bilanzrechts) of 25 May 2009, derivative financial instruments in the trading portfolio (trading portfolio derivatives) within the meaning of

Section 340e (3) sentence 1 of the German Commercial Code (Handelsgesetzbuch) read in conjunction with Section 35 (1) number 1a of the Credit Institution Accounting Regulation (Verordnung über die Rechnungslegung der Kreditinstitute) are classified under "Other assets and liabilities" as of the December 2010 reporting date. Trading portfolio derivatives are listed separately in the Statistical Series Banking statistics, in Tables I.1 to I.3. **2** For building and loan associations: including deposits under savings

¹ The reserve maintenance period starts on the settlement day of the main refinancing operation immediately following the meeting of the Governing Council of the ECB for which the discussion on the monetary policy stance is scheduled. ² Article 3 of the Regulation of the European Central Bank on the application of minimum reserves (excluding liabilities to which a reserve ratio of 0% applies, pursuant to Article 4(1)). ³ Amount after applying the reserve ratio to the reserve base. The reserve ratio for

liabilities with agreed maturities of up to two years was 2% between 1 January 1999 and 17 January 2012. Since 18 January 2012, it has stood at 1%. ⁴ Article 5(2) of the Regulation of the European Central Bank on the application of minimum reserves. ⁵ Average credit balances of credit institutions at national central banks. ⁶ Average credit balances less required reserves after deduction of the lump-sum allowance. ⁷ Required reserves after deduction of the lump-sum allowance.

* The interest rate statistics gathered on a harmonised basis in the euro area from January 2003 are collected in Germany on a sample basis. The MFI interest rate statistics are based on the interest rates applied by MFIs and the related volumes of euro-denominated deposits and loans to households and non-financial corporations domiciled in the euro area. The household sector comprises individuals (including sole proprietors) and non-profit institutions serving households. Non-financial corporations include all enterprises other than insurance corporations, banks and other financial institutions. The most recent figures are in all cases to be regarded as provisional. Subsequent revisions appearing in the following Monthly Report are not specially marked. Further information on the MFI interest rate statistics can be found on the Bundesbank's website (Statistics/Money and capital markets/Interest rates and yields/Interest rates on deposits and loans). ^o The statistics on outstanding amounts are collected at the end of the month. ¹ The effective interest rates are calculated either as

annualised agreed interest rates or as narrowly defined effective rates. Both calculation methods cover all interest payments on deposits and loans but not any other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance. ² Data based on monthly balance sheet statistics. ³ Secured and unsecured loans for home purchase, including building and home improvements; including loans granted by building and loan associations and interim credits as well as transmitted loans granted by the reporting agents in their own name and for their own account. ⁴ Loans for consumption are defined as loans granted for the purpose of personal use in the consumption of goods and services. ⁵ For the purpose of these statistics, other loans are loans granted for other purposes such as business, debt consolidation, education, etc. ⁶ Including overdrafts (see also footnotes 12 to 14 on p. 47).

For footnotes * and 1 to 6, see p. 44*. For footnote x see p. 47*. + For deposits with an agreed maturity and all loans excluding revolving loans and overdrafts, credit card debt: new business covers all new agreements between households or non-financial corporations and the bank. The interest rates are calculated as volume-weighted average rates of all new agreements concluded during the reporting month. For overnight deposits, deposits redeemable at notice, revolving loans and overdrafts, credit card debt: new business is collected in the same way as outstanding amounts for the sake of simplicity. This means that all outstanding deposit and lending business at

the end of the month has to be incorporated in the calculation of average rates of interest. 7 Estimated. The volume of new business is extrapolated to form the underlying total using a grossing-up procedure. 8 Including non-financial corporations' deposits; including fidelity and growth premiums. 9 Excluding overdrafts. 10 Annual percentage rate of charge, which contains other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance.

For footnotes * and 1 to 6, see p. 44*. For footnotes + and 7 to 10, see p. 45*;
11 For the purposes of the interest rate statistics, a loan is considered to be secured if collateral (amongst others financial collateral, real estate collateral, debt securities) in at least the same value as the loan amount has been posted, pledged or assigned.
12 Including revolving loans which have all the following features: (a) the borrower may use or withdraw the funds to a pre-approved credit limit without giving prior notice to the lender; (b) the amount of available credit can increase and decrease as funds are borrowed and repaid; (c) the loan may be used repeatedly; (d) there is no obligation of regular repayment of funds. **13** Overdrafts are defined as debit balances

on current accounts. They include all bank overdrafts regardless of whether they are within or beyond the limits agreed between customers and the bank. **14** Including convenience and extended credit card debt. Convenience credit is defined as the credit granted at an interest rate of 0% in the period between payment transactions effected with the card during one billing cycle and the date at which the debt balances from this specific billing cycle become due. **15** The amount category refers to the single loan transaction considered as new business. **x** Dominated by the business of one or two banks. Therefore, the value cannot be published due to confidentiality.

Sources: The calculations for the insurance sectors are based on supervisory data according to Solvency I and II and for pension funds on IORP supervisory data and own data collections as of 2020 Q1. Until 2019 Q4 these are compiled using Solvency I supervisory data, supplemented by voluntary reports and own calculations. ¹ Accounts receivable to monetary financial institutions, including registered bonds, borrowers' note loans and registered Pfandbriefe. For pension funds as of 2020 Q1 fair values, previously book values. ² Including deposits retained on assumed reinsurance as well as registered bonds, borrowers' note loans and registered Pfandbriefe. For pension funds

as of 2020 Q1 fair values, previously book values. ³ Including reinsurance recoverables and claims of pension funds on pension managers. ⁴ Valuation of listed securities at the corresponding consistent price from the ESCB's securities database. ⁵ Not including the reinsurance business conducted by primary insurers, which is included there. ⁶ The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included. ⁷ Change in data sources.

Sources: The calculations for the insurance sectors are based on supervisory data according to Solvency I and II and for pension funds on IORP supervisory data and own data collections as of 2020 Q1. Until 2019 Q4 these are compiled using Solvency I supervisory data, supplemented by voluntary reports and own calculations. ¹ Including deposits retained on ceded business as well as registered bonds, borrowers' note loans and registered Pfandbriefe. ² Including claims of pension funds on pension managers and entitlements to non-pension benefits. ³ Technical reserves "life" taking account of

transitional measures. Health insurance is also included in the "non-life insurance" sector. ⁴ Own funds correspond to the sum of "Net worth" and "Shares and other equity". ⁵ Not including the reinsurance business conducted by primary insurers, which is included there. ⁶ Valuation at book values. The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included. ⁷ Change in data sources.

1 Bearer debt securities with maximum maturities according to the terms of issue of over 4 years. Structured debt securities, debt securities with unscheduled redemption, zero coupon bonds, floating rate notes and bonds not denominated in Euro are not included. Group yields for the various categories of securities are weighted by the amounts outstanding of the debt securities included in the calculation. Monthly figures

are calculated on the basis of the yields on all the business days in a month. The annual figures are the unweighted means of the monthly figures. Adjustment of the scope of securities included on 1 May 2020. 2 End of year or month. 3 Source: Deutsche Börse AG. 4 Only debt securities eligible as underlying instruments for futures contracts; calculated as unweighted averages.

Source: Bundesbank calculations based on Federal Statistical Office data. ¹ Annual figures based on the calculations of the Federal Statistical Office. Bundesbank supplementary estimations for the reporting years after 2011 that are not yet available. The quarterly figures contain numerous off-budget entities which are assigned to the general government sector as defined in the national accounts but are not yet included in the annual calculations. From 2012 also including the bad bank FMSW. ² The annual figures do not tally with the sum of the quarterly figures, as the

latter are all provisional. The quarterly figures for some insurance sectors are estimated. ³ The development of the types of expenditure recorded here is influenced in part by statistical changeovers. ⁴ Including discrepancies in clearing transactions between central, state and local government. ⁵ On the revenue side, this contains proceeds booked as disposals of equity interests and as loan repayments. On the expenditure side, this contains the acquisition of equity interests and loans granted. ⁶ Including central government liquidity assistance to the Federal Employment Agency.

Sources: Federal Statistical Office; Federal Employment Agency. * Annual and quarterly figures: averages; calculated by the Bundesbank; deviations from the official figures are due to rounding. 1 Workplace concept; averages. 2 Monthly figures: end of month. 3 Number within a given month. 4 Mid-month level. 5 Relative to the total civilian labour force. 6 Excluding government-assisted forms of employment and seasonal jobs, including jobs located abroad. 7 From January 2017 persons receiving additional income assistance (unemployment benefit and unemployment benefit II at the same time) shall be assigned to the legal category of the Third Book of the Social Security

Code (SGB III). 8 Statistical break due to late recording of unemployed persons in the legal category of the Second Book of the Social Security Code (SGB II). 9 Initial preliminary estimate by the Federal Statistical Office. 10 From May 2021, calculated on the basis of new labour force figures. 11 Unadjusted figures estimated by the Federal Employment Agency. In 2019 and 2020, the estimated values for Germany deviated from the final data by a maximum of 0.1% for employees subject to social contributions, by a maximum of 0.9% for persons solely in jobs exempt from social contributions, and by a maximum of 55.3% for cyclically induced short-time work.

* Non-financial groups admitted to the Prime Standard segment of the Frankfurt Stock Exchange which publish IFRS consolidated financial statements on a quarterly or half-yearly basis and make a noteworthy contribution to value added in Germany. Excluding groups engaged in real estate activities. 1 Earnings before interest, taxes, depreciation and amortisation. 2 Quantile data are based on the groups' unweighted return on sales. 3 Annual figures do not always match the sum of the two half-year fig-

ures. See Quality report on consolidated financial statement statistics, p. 3. 4 Adjusted for substantial changes in the basis of consolidation of large groups and in the reporting sample. See the explanatory notes in Statistical Series Seasonally adjusted business statistics. 5 Including groups in agriculture and forestry. 6 From this point onwards: significant changes in IFRS standards, impairing comparability with previous periods.

XII. External sector

* Assets and liabilities vis-à-vis all countries within and outside the euro area. Up to December 2000 the levels at the end of each quarter are shown, owing to revaluations, at market prices; within each quarter, however, the levels are computed on the basis of cumulative transaction values. From January 2001 all end-of-month levels are valued at market prices. **1** Mainly net claims on TARGET2 balances (acc. to the respective country designation), since November 2000 also balances with non-euro area central banks

within the ESCB. **2** Mainly long-term debt securities from issuers within the euro area. **3** Including estimates of currency in circulation abroad. **4** See Deutsche Bundesbank, Monthly Report, October 2014, p. 22. **5** Difference between External assets and External liabilities. **6** Euro opening balance sheet of the Bundesbank as at 1 January 1999.

* The assets and liabilities vis-à-vis non-residents of banks (MFIs) in Germany are shown in Table 4 of Section IV, "Banks". Statistical increases and decreases have not been

eliminated; to this extent, the changes in totals are not comparable with the figures shown in Table XII.7.

XII. External sector

9. ECB's euro foreign exchange reference rates of selected currencies *

* The effective exchange rate corresponds to the weighted external value of the currency concerned. The method of calculating the indicators of the German economy's price competitiveness is consistent with the procedure to compute the effective exchange rates of the euro. A decline in the figures implies an increase in competitiveness. The weights are based on trade in manufactured goods and services. For more detailed information on methodology and weighting scale, see the website of the Deutsche Bundesbank (<https://www.bundesbank.de/content/796162>). 1 The calculations are based on the weighted averages of the changes in the bilateral exchange rates of the euro vis-à-vis the currencies of the following countries: Australia, Bulgaria, Canada, China, Croatia, Czechia, Denmark, Hong Kong, Hungary, Japan, Norway, Poland, Romania, Singapore, South Korea, Sweden, Switzerland, the United Kingdom and the United States. Where current price and wage indices were not avail-

able, estimates were used. 2 ECB calculations. Includes countries belonging to the group EER-19 and additionally Algeria, Argentina, Brazil, Chile, Colombia, Iceland, India, Indonesia, Israel, Malaysia, Mexico, Morocco, New Zealand, Peru, Philippines, the Russian Federation, Saudi Arabia, South Africa, Taiwan, Thailand, Turkey, Ukraine and United Arab Emirates. 3 Annual and quarterly averages. 4 Euro area countries (from 2001 including Greece, from 2007 including Slovenia, from 2008 including Cyprus and Malta, from 2009 including Slovakia, from 2011 including Estonia, from 2014 including Latvia, from 2015 including Lithuania) as well as Canada, Denmark, Japan, Norway, Sweden, Switzerland, the United Kingdom and the United States. 5 Euro area countries (current composition) and countries belonging to the group EER-19. 6 Euro area countries (current composition) and countries belonging to the group EER-42.

Overview of publications by the Deutsche Bundesbank

This overview provides information about selected recent economic and statistical publications by the Deutsche Bundesbank. Unless otherwise indicated, these publications are available in both English and German, in printed form and on the Bundesbank's website.

The printed publications are available free of charge to interested parties and may be obtained through the Bundesbank's order portal. Up-to-date figures for selected statistical datasets are available on the Bundesbank's website. In addition, the new Statistical Series provide a new basic structure and advanced options for using data and are also available on the Bundesbank's website.

■ Annual Report

■ Financial Stability Review

■ Monthly Report

A list of the articles published in the period from 2010 to 2021 is available on the Bundesbank's website.

Monthly Report articles

April 2021

- The impact of monetary policy depending on the debt situation in the non-financial private sector: Evidence for the euro area
- Assessments and expectations of firms in the pandemic: findings from the Bundesbank Online Panel Firms
- Digital money: options for payments

May 2021

- The current economic situation in Germany

June 2021

- Outlook for the German economy for 2021 to 2023
- Government finances: Central bank bond purchases increase sensitivity to interest rate changes
- Federal debt: allocate premia on accruals basis in budgetary interest expenditure
- Local government finances: how cash advances can be limited and budget imbalances avoided

July 2021

- Cross-border corporate takeovers: the impact of internationalisation on enterprises in Germany
- Crypto tokens and decentralised financial applications
- Digital risks in the banking sector
- Macroprudential policy and growth-at-risk

August 2021

- The current economic situation in Germany

September 2021

- The Eurosystem's monetary policy strategy
- The impact of the Eurosystem's monetary policy on Bitcoin and other crypto tokens

- The performance of German credit institutions in 2020

October 2021

- State government finances in 2020: deficit due to temporary effects of pandemic, escape clauses also used to build reserves
- The global economy during the coronavirus pandemic
- What do households in Germany think about the digital euro? First results from surveys and interviews
- The regulation of remuneration at credit institutions

November 2021

- The current economic situation in Germany

December 2021

- Outlook for the German economy for 2022 to 2024
- German enterprises' profitability and financing in 2020

January 2022

- Changes in the secured money market
- Climate change and climate policy: analytical requirements and options from a central bank perspective
- Scenario-based equity valuation effects induced by greenhouse gas emissions

February 2022

- The current economic situation in Germany

■ Statistical Series*

Banks

- Banking statistics, monthly
- Statistics on payments and securities trading, September

Corporate financial statements

- Consolidated financial statement statistics, June/December
- Financial statement statistics (extrapolated results), December
- Financial statement statistics (ratios), May
- Financial statement statistics (ratios – provisional data), May

Economic activity and prices

- Seasonally adjusted business statistics, monthly

Exchange rates

- Exchange rate statistics, monthly

External sector

- Balance of payments statistics, monthly
- Direct investment statistics, April
- International investment position and external debt, monthly

Macroeconomic accounting systems

- Financial accounts, June

Money and capital markets

- Capital market indicators, monthly
- Investment funds statistics, monthly
- Securities issues statistics, monthly
