The German original of this Monthly Report went to press at 11 a.m. on 18 March 2022.

Publishing schedules for selected statistics can be downloaded from our website. The statistical data are also published on the website.

The Monthly Report is published by the Deutsche Bundesbank, Frankfurt am Main, by virtue of Section 18 of the Bundesbank Act. It is available to interested parties free of charge.

This is a translation of the original German language version, which is the sole authoritative text.

■ Economic conditions

Underlying trends

Economic recovery originally expected ...

The impact of Russia's attack on Ukraine is likely to place a noticeable strain on economic activity in Germany from March. Before the invasion, the economic situation in the first quarter of 2022 was better than expected despite the Omicron wave. Retail sales and turnover in the hotel and restaurant sector recovered slightly in January from the steep decline in December. According to data provided by the company health insurance institutions, sickness rates were not strikingly high compared with December, either. Furthermore, materials shortages continued to ease. Given the bulging order books, industrial output therefore continued to grow in January. The same holds true for construction, which also benefited from the mild weather. Supply bottlenecks may have improved further in February, although survey results are sending out mixed signals in this respect. In any case, sentiment in the German economy brightened on a broad basis in January and February according to the ifo Institute. In addition, the pandemic containment measures are gradually being eased.

... significantly weakened through impact of Russia's attack on Ukraine

However, Russia's invasion of Ukraine means that supply chain problems are likely to intensify again as early as March. Moreover, energy commodity prices surged in the wake of the war and the economic sanctions imposed. This will probably put a damper on household consumption and the output of energy-intensive industries. Together with the looming disruptions to foreign trade and the heightened uncertainty, the consequences of the war are likely to slow the economic recovery originally expected by a significant degree. Only a small period of the first quarter is affected by this, however. Economic activity could more or less stagnate. From today's perspective, however, the strong recovery expected for the second

quarter is likely to turn out considerably weaker. The magnitude of the repercussions of the conflict are very uncertain, however, and dependent on how the situation evolves.

Industry

Industrial output continued to rise in January 2022. This was partly attributable to a slight easing of supply bottlenecks and the still high demand for industrial products. According to ifo Institute surveys, the percentage of enterprises to see output hampered by delivery bottlenecks declined significantly. Survey results provided by IHS Markit also indicate fewer delivery problems in January. In seasonally adjusted terms,¹ industrial output was up distinctly (+1¼%) on the previous month and there was even a substantial increase in comparison with the average of the fourth quarter (+3%). Broken down by main groupings, the production of capital goods rose strongly in most sectors. The output of consumer goods was also up steeply. By contrast, the manufacture of intermediate goods showed less dynamic growth.

Industrial output benefited in January from a slight easing of supply bottlenecks

New industrial orders rose markedly in January and were up by 1¾% on the previous month in seasonally adjusted terms. In quarter-on-quarter terms, they were in fact substantially higher (+5%). A look at the regional breakdown shows that the rise was attributable to the inflow of orders from non-euro area countries. By contrast, demand from euro area countries was down somewhat and domestic demand fell distinctly. Broken down by sector, the manufacturers of capital goods reported a steep increase in orders. In particular, orders were up strongly in other transport equipment

Marked rise in new industrial orders

¹ Seasonal adjustment here and in the remainder of this text also includes adjustment for calendar variations, provided they can be verified and quantified.

and among producers of motor vehicles and motor vehicle parts. Producers of intermediate goods experienced a stagnation in their inflow of orders but considerably more orders were received in the manufacture of basic metals and production of fabricated metal products. Producers of consumer goods saw a slight drop in incoming orders although manufacturers of pharmaceutical products posted a steep rise in orders. Overall, industrial orders in January were up considerably on the pre-crisis level of the fourth quarter of 2019 (+14¼%). Compared with industrial output, which was still 1½% below its pre-crisis level, demand for industrial products remained exceptionally high.

Nominal industrial sales rose steeply in January in line with industrial output. They were up by 3¼% on the month in seasonally adjusted terms and by 6% in quarter-on-quarter terms. Broken down by regional sales markets, the strong rise compared with the previous quarter was broadly based. Broken down by sector, there was a particularly steep increase in sales of capital goods but sales of intermediate and consumer goods expanded strongly, too. By contrast, nominal exports of goods declined substantially in January in spite of higher export sales (-3%). Exports of goods were down by 1½% compared with the previous quarter. In price-adjusted terms, goods exports were even significantly below the average of the previous quarter (-4%). This was largely due to goods exports to the euro area. Nominal goods imports were down steeply on the previous month (-4%), with just a slight decline on the average of the previous quarter (-½%). The sharp rise in import prices for energy, in particular, virtually balanced out the strong contraction in price-adjusted goods imports (-5¼%).

Construction

Construction output displayed robust growth in January 2022, rising by 10% on the month in seasonally adjusted terms and by 7% com-

Nominal industrial sales substantially higher in January, but exports of goods down

Robust growth in construction output

pared with the fourth quarter of 2021. Output in the finishing trades was up particularly substantially on the quarter, with the figure for the previous month additionally having undergone a strong upward revision. Output in the main construction sector likewise increased steeply, with a slightly stronger rise posted in building construction than in civil engineering. Construction activity was bolstered in January by the comparatively mild weather for this time of year. Furthermore, demand for construction work remained high. New orders were up significantly in the fourth quarter of 2021 – the latest period for which figures are available – compared with the previous quarter. In addition, the reach of existing orders once again climbed to a record high in February according to ifo Institute surveys. Equipment utilisation also reached a new peak in February. The percentage of enterprises in the main construction sector reporting a disruption to production due to a lack of staff declined for the third consecutive month. The shortage of materials also continued to dissipate after peaking in June 2021.

Labour market

Employment up substantially at beginning of 2022

The positive labour market development was not noticeably hampered by the Omicron wave at the beginning of the year. After seasonal adjustment, employment in fact expanded exceptionally substantially in January 2022. With an increase of 80,000 persons on the previous month, the rise was somewhat stronger than in the months of the second half of 2021. The comparatively mild winter weather may also have contributed to the positive developments in employment, however. The increase in jobs subject to social security contributions was particularly robust (according to initial estimates as at December 2021). According to the initial estimate by the Federal Employment Agency, the number of persons in cyclically induced short-time work declined again slightly in December, although the number of registrations for short-time work had suggested a different development. The loss of working hours per

short-time worker rose significantly, however. Up until February, the number of registrations for cyclically motivated short-time work remained slightly elevated. Other leading indicators for employment developments nevertheless showed very optimistic sentiment. However, the relevant surveys conducted by the ifo Institute and the Institute for Employment Research (IAB) could not yet take into account the most recent developments since Russia's invasion of Ukraine.

After seasonal adjustment, registered unemployment continued its marked decline in February, falling by 33,000 persons. The unemployment rate dropped by 0.1 percentage point to 5.0% and thus returned to its very low pre-crisis level. Unemployment fell in both the statutory insurance scheme, which is influenced by cyclical factors, and, of late, more sharply among those receiving the basic welfare allowance. The IAB's unemployment barometer climbed well into positive territory in February. Unemployment is therefore expected to continue to decrease over the next few months, although the fallout from the war in Ukraine has not yet been factored in here either.

Slight fall in unemployment

Prices

The rise in international crude oil prices, evident for some time now, accelerated sharply from the end of February, triggered by the Russian invasion of Ukraine. The price for a barrel of Brent crude oil stood at US\$134 for a time and was thus over 37% higher than before 24 February 2022. Prices have come down slightly since, presumably due to OPEC potentially stepping up production and the resurgence in infection rates in China, and stood at US\$111 as this report went to press. European prices for natural gas at the trading hub in the Netherlands also fell. They dropped to €105 from their recent high of more than €240 per megawatt hour. However, they were thus still roughly 22% higher than before the war. The prices of other commodities in which Russia

Crude oil prices sharply higher since beginning of war and very volatile

has a high share of production also rose sharply as a result of the war.

Persistent price pressure at upstream production stages even before the Russian invasion

The usual delays in data collection mean that the latest figures for prices at the upstream stages of the economy are those for January 2022. However, even at the beginning of the year, the already distinct upward pressure on prices intensified further. Import prices went up very steeply, with the energy component accounting for roughly half of this rise. Prices also rose markedly at the producer level, with the non-energy component making the largest contribution. Import prices increased by just under 27% in year-on-year terms and by 25% at the producer level.

Inflation rate up further in February

After seasonal adjustment, consumer prices as measured by the Harmonised Index of Consumer Prices (HICP) rose again substantially in February by 0.6% compared with the previous month. The Russian invasion of Ukraine was not yet a factor in the marked increase as prices are usually collected in the first three weeks of the respective month. The inflation rate stood at 5.5% on the year and was thus up by 0.4 percentage point compared with January. Higher inflation was evident in all the components with the exception of services. Due to the war in Ukraine, the inflation rate is likely to continue to edge slightly upwards in the next few months, probably largely on the back of energy prices. It is, however, currently particularly difficult to assess how energy markets will develop. Prices for food and industrial goods, too, are expected to receive additional impetus as a result of the slump in wheat exports from Ukraine and Russia and new disruptions to supply chains.

■ Public finances²

Statutory health insurance scheme

The statutory health insurance (SHI) scheme (comprising the health insurance institutions

and the health fund) finished 2021 with a significant deficit. This deficit came in below both last year's level and the amount forecast. According to preliminary figures, it stood at €4½ billion (2020: -€6 billion).³ The health fund was the driving force behind this improvement. By contrast, the health insurance institutions saw a rise in their deficit.⁴

The health fund posted a surplus of €1½ billion in 2021. In autumn 2020, the group of SHI estimators forecast a deficit of €1 billion. The deficit had totalled €3½ billion in 2020. This year-on-year improvement stems primarily from the fact that central government has now almost fully refunded the health fund's pandemic-related burdens. In addition to these refunds, the health fund received the regular central government grant of €14½ billion and a special grant of €5 billion. Contribution receipts grew steeply, by 5%.⁵ Almost two percentage points of this growth were attributable to a rise in the average supplementary contribution rate (+ 0.3 percentage point to 1.3%). The expenditure side recorded pandemic-related expenses of €17½ billion.⁶ Expenditure by the health fund not directly related to the pandemic went up

Health fund in surplus – reserves up to €7½ billion

² In the short commentaries on public finances, the emphasis is on recent outturns. The quarterly editions of the Monthly Report (published in February, May, August and November), by contrast, contain an in-depth description of public finance developments during the preceding quarter. For detailed data on budgetary developments and public debt, see the statistical section of this report.

³ Preliminary accounting figures for 2021 compared with the final annual outturn for 2020 (see the table on p. 9). By contrast, the chart on p. 10 shows preliminary outturns.

⁴ In 2021, reserves belonging to the health insurance institutions totalling €8 billion were redistributed among the institutions via the health fund. The associated payment flows between the health insurance institutions and the health fund do not influence the financial situation of the SHI scheme and its two constituent parts overall. The revenue and expenditure growth figures in this report are therefore adjusted for this.

⁵ They rose considerably more sharply than the group of SHI estimators had assumed when projecting expenditure in autumn 2020. This enabled the health fund to close the year in surplus rather than with the expected deficit.

⁶ These include funds for tests (almost €6½ billion), vaccinations (cost share accruing to the vaccination centres and remuneration for doctors and pharmacists, €3½ billion) and protective face masks for risk groups (€1½ billion). They also encompass financial assistance for hospitals to compensate them for empty beds resulting from the pandemic (€5 billion).

by 4½%. At the end of the year, the fund's reserves amounted to €7½ billion and were thus €3 billion above their statutory lower limit.⁷

Health insurance institutions' deficit up; reserves down by less than anticipated

The health insurance institutions posted a deficit of almost €6 billion in 2021. This constitutes a rise of just over €3 billion on the previous year. In autumn 2020, the group of SHI estimators had forecast a deficit of €8 billion. Expenditure did rise steeply, by just over 5%; however, growth lagged 1½ percentage points behind what the group of SHI estimators had expected. Of the spending on benefits, expenditure on remedies and therapeutic appliances (+ 11%) and pharmaceuticals (+ 8%), in particular, was up substantially. This was partly due to the fact that VAT was temporarily lower in the second half of 2020. Spending on hospital treatment, a major expenditure item, rose by 4½%. Yet, together with the compensation for empty beds that was granted for some time, the SHI scheme paid 1% less to hospitals than a year earlier. Following strong growth in 2020,

spending on medical treatments expanded at a below-average rate of 1½%. Administrative expenditure even fell by just under ½%, eased by slightly lower pension provisions. Health insurance institutions' revenue (for the most part, transfers from the health fund) grew by 4%. The health insurance institutions' financial reserves sank considerably as a result of the deficit. Overall, however, they still had reserves of €11 billion at year-end. For the health insurance institutions as a whole, the financial reserves were thus €6½ billion above the statutory lower limit.

With the figures projected by the group of SHI estimators and the resultant €7 billion in additional central government funds, the SHI

⁷ The newly introduced Hospital Future Fund also has extensive reserves. According to provisional figures, outflows from this fund amounted to €250 million in 2021. This leaves just under €3 billion in central government funds and a little over €1 billion from state government for additional investment in technical equipment for hospitals.

Finances of the statutory health insurance scheme*

 Deutsche Bundesbank

Group of SHI estimators expects deficit for scheme as a whole

scheme as a whole would close 2022 with a deficit of around €2 billion. The health fund alone would bear the strain of this deficit, as parts of its liquidity reserves are used to provide the health insurance institutions with additional funds. The health insurance institutions receive €½ billion to compensate for part of the losses caused by the reduction of SHI scheme contributions on occupational pensions since 2020, and an additional €1½ billion from the liquidity reserves because of a special rule.⁸ On top of this, further liquidity reserve funds are transferred to the innovation and structural funds.

According to the results of the group of SHI estimators, if the average supplementary contribution rate does not change, the higher funds from central government should put the health insurance institutions on course to a balanced budget. The group of SHI estimators forecast a slight slowing in expenditure growth next year (4½%). As far as revenue is concerned, the health insurance institutions will receive extensive special transfers in order to stabilise the average supplementary contribution rate. Over and above the €2 billion from the health fund's liquidity reserves, central government will provide a special grant of €14 billion. All in all, special transfers will be €10 billion up on 2021.

Health insurance institutions set to record balanced budget thanks to higher central government funds

As things currently stand, there is good reason to believe that the outturn for the scheme as a whole could be better than expected in autumn. For one thing, the 2021 expenditure base for the projected expenditure growth is around ½ percentage point lower than expected. Furthermore, the actual average supplementary contribution rate is somewhat higher than anticipated. However, risk is heightened due to the war in Ukraine.

Better outturn possible in 2022 – but heightened risk due to war in Ukraine

The SHI scheme will continue to face considerable challenges in the years to come. As in previous years, the structural expenditure trend is expected to rise significantly more steeply than the revenue base. This has nothing to do with the pandemic. Without fundamentally curbing expenditure dynamics, ever larger supplementary contribution rates and/or ever higher tax grants will remain necessary in the future. As things currently stand, there will be no repetition of central government's €14 billion in special grants in 2023. This means that the supplementary contribution rates would need to rise by around one percentage point.

As of 2023: curb structurally high expenditure dynamics to rein in rise in supplementary contribution rates

⁸ The health insurance institutions are allocated the funds exceeding the minimum reserve level of the health fund based on the result of the group of SHI estimators in autumn 2021. However, as the outturn for 2021 was actually better than anticipated, €1½ billion worth of reserves that are available in principle will not be distributed.

Public long-term care insurance scheme

Deficit due to pandemic-related special burdens

The core budget of the public long-term care insurance scheme was €1½ billion in deficit in 2021.⁹ This represents a deterioration of €2½ billion compared with the previous year.¹⁰ Without the pandemic-related special payments on both the revenue and expenditure side, there would have been a surplus of almost €1½ billion and the result would have been roughly the same as in 2020. The reserves shrank to €7 billion at the end of 2021. However, they still exceeded the statutory lower limit of half of one month's expenditure by just over €4½ billion. Nevertheless, there were reports of liquidity shortfalls in autumn. In the end, central government provided a non-repayable special grant of €1 billion.

Lower central government funds balanced by payments from health insurance institutions

Contribution receipts increased by 3½%. Higher employee contributions (+4%) were partly offset by slightly lower contributions payable on unemployment benefits. Contributions payable on pensions increased by 2½%. Central government funds were down by just under €1 billion. However, there was an extremely sharp rise in other revenue. This was due to the statutory and private health insurance schemes contributing just over €1 billion to the pandemic-related special payments made to the long-term care insurance scheme. Total revenue increased by a little over 3½%.

Pandemic-related special payments and continued high underlying pace of expenditure growth

Expenditure (+9½%) was up by much more than revenue. Of this, 3½ percentage points (€2 billion) were attributable to the rise in pandemic-related special payments to long-term care facilities and for coronavirus tests.¹¹ With benefit rates unchanged, the long-term care insurance scheme's expenditure on benefits continued to rise steeply, by 6%, with cash benefits even going up by 8½%. Spending on non-cash benefits, an even larger expenditure item, rose by 4½%. Expenditure on residential nursing care remained unchanged at last year's level, which had gone down slightly.

Finances of the public long-term care insurance scheme*

Source: Federal Ministry of Health. * Preliminary quarterly figures. The final annual figures differ from the total of the reported preliminary quarterly figures as the latter are not revised subsequently. ¹ Including transfers to the long-term care provident fund.
 Deutsche Bundesbank

⁹ The developments outlined here and in the remainder of the text exclude the provident fund. Since 2015, this fund has received transfers from the core area corresponding to the receipts of 0.1 percentage point of the contribution rate. Assets accumulated in this way are to be depleted again in the 2030s to dampen the expected contribution rate rise. At the end of 2021, these accumulated reserves amounted to just under €10 billion.

¹⁰ Preliminary accounting figures for 2021 compared with the final annual outturn for 2020.

¹¹ Special payments amounted to €5 billion in total. The long-term care insurance scheme reimbursed non-residential and (partially) residential long-term care facilities for coronavirus testing costs (just over €1½ billion). Furthermore, these facilities received financial compensation for additional expenditure relating to the pandemic. They were also compensated for revenue shortfalls caused by the non-utilisation of long-term care services on account of the pandemic, for instance because no new long-term care patients could be accepted. Had there been no pandemic, however, spending on benefits for residential long-term care patients, above all, would have been higher.

Virtually no change in deficit expected for 2022

The long-term care insurance scheme's financial situation is not likely to change much this year. The revenue base is expected to grow significantly, although the war in Ukraine is a source of uncertainty. On the expenditure side, pandemic-related special payments have been extended until mid-2022. They are expected to be less than half as high as last year. By contrast, the new regular central government grants of €1 billion and a higher contribution rate for childless persons (+ 0.1 percentage point) will only compensate for some of the additional burdens stemming from the latest long-term care reform.¹² The financial situation is set to deteriorate in the coming years. Demographic developments and the expanded benefits will push expenditure up markedly. Without a change to the contribution rate, the freely available reserves would be more or less exhausted after 2023. Successive significant rises in the contribution rate are therefore on the cards.

■ Securities markets

Bond market

High net issuance of German debt securities in January 2022

At €143.3 billion, gross issuance in the German bond market in January 2022 was significantly up on the previous month's figure of €84.1 billion. After taking account of increased redemptions and changes in issuers' holdings of their own debt securities, the outstanding volume of domestic bonds rose by €39.1 billion, following a drop of €27.6 billion in December 2021. The outstanding volume of foreign debt securities in the German market grew by €22.0 billion, which meant that the outstanding volume of domestic and foreign debt securities in Germany increased by €61.1 billion on balance in January.

Enterprises' capital market debt higher

Domestic enterprises expanded their capital market debt by €16.6 billion in January, following net redemptions of €9.0 billion in December. The bulk of this net issuance was attributable to other financial intermediaries.

Domestic credit institutions issued bonds totalling €13.3 billion net in January, following net redemptions of €16.6 billion in the previous month. This net issuance was mainly attributable to mortgage Pfandbriefe (€5.9 billion) and debt securities (€5.5 billion) issued by specialised credit institutions. Public Pfandbriefe and other bank debt securities that can be structured flexibly were also issued, albeit to a lesser extent, in the amount of €1.0 billion each in net terms.

Net issuance by credit institutions

The public sector issued bonds worth €9.1 billion net in the reporting month. Central government increased its capital market debt by €7.3 billion on balance. It mainly issued two-year Federal Treasury notes (Schätze) (€7.1 billion) and five-year Federal notes (Boblis) (€6.5 billion), but also 30-year Federal bonds (Bunds) on a smaller scale (€4.5 billion). This contrasted with net redemptions of ten-year Federal bonds (Bunds) totalling €6.6 billion. State and local governments issued bonds in the amount of €1.8 billion on balance.

Public sector capital market debt up

Domestic non-banks were the strongest group of buyers in January. They added bonds worth €39.9 billion net to their portfolios, focusing their interest on foreign securities. The Bundesbank acquired debt securities worth €15.0 billion net, largely under the Eurosystem's asset purchase programmes, which consisted almost exclusively of domestic securities issued by the public sector. Foreign investors purchased domestic debt securities for a net of €9.1 billion. By contrast, domestic credit institutions sold bonds worth €2.9 billion on balance.

Purchases of debt securities

Equity market

In the reporting month, domestic enterprises raised fresh capital resources of €0.4 billion on balance by placing new shares in the German equity market. Net issuance of foreign equities in Germany totalled €5.3 billion in the same period. Domestic non-banks dominated on the

Net issuance of German equities

¹² See Deutsche Bundesbank (2021).

buyers' side, acquiring assets in the amount of €7.2 billion net. Domestic credit institutions expanded their equity portfolios by €2.1 billion net, while non-resident investors sold domestic equities for €3.6 billion on balance.

Mutual funds

Inflows to mutual funds

Domestic mutual funds recorded an inflow of €17.0 billion in January. The main beneficiaries were specialised funds reserved for institutional investors (€11.8 billion). Among the various asset classes, the bulk of investment flowed into mixed securities funds (€5.1 billion), equity funds (€4.2 billion), bond funds (€3.2 billion) and open-end real estate funds (€2.8 billion). Foreign mutual funds placed shares worth €6.5 billion in the German market in January. On balance, domestic non-banks were virtually the only purchasers of mutual fund shares in the reporting month (€21.7 billion). Domestic credit institutions and foreign investors purchased mutual fund shares worth €1.2 billion and €0.6 billion net, respectively.

Balance of payments

Current account surplus narrows considerably

Germany's current account recorded a surplus of €11.0 billion in January 2022, down €13.6 billion on the previous month's level. The surplus in the goods account declined considerably, with the surplus in invisible current transactions, which comprise services as well as primary and secondary income, contracting even more strongly.

Falling surplus in goods account

In January, the surplus in the goods account fell by €4.3 billion on the month to €4.5 billion because receipts recorded a sharper decrease than expenditure.

Decline in services account balance as well as in primary and secondary income

The surplus in invisible current transactions declined by €9.3 billion to €6.5 billion in January 2022, owing to lower results in all three sub-accounts. The surplus of €1.5 billion in the services account in December 2021 turned into a

deficit of €0.3 billion in the reporting month. Receipts recorded a stronger decline than expenditure, especially in the context of charges for the use of intellectual property, other business services and computer services. Net receipts in primary income fell by €5.3 billion to €12.8 billion, with the revenue side showing a particular decline following the payment of the EU's agricultural subsidies to Germany in December 2021. In addition, the secondary income deficit rose by €2.2 billion to €6.1 billion, notably on account of lower general government revenue from current taxes on income and wealth of non-residents.

In January 2022, events in the international financial markets were shaped by rising yields linked to persistently high inflation rates and expectations that the major central banks would take further steps towards normalising monetary policy. Germany's cross-border portfolio investment generated net capital exports of €27.2 billion (December 2021: €34.0 billion).

Deutsche Bundesbank

Domestic investors added, on balance, €33.4 billion worth of securities issued by non-residents to their portfolios, purchasing bonds (€19.5 billion), mutual fund shares (€6.5 billion), shares (€4.9 billion) and money market paper (€2.5 billion). Non-resident investors acquired German securities to the tune of €6.1 billion net. They purchased bonds (€13.8 billion) and mutual fund shares (€0.6 billion), while offloading money market paper (€4.7 billion) and shares (€3.6 billion).

In January, the balance of financial derivatives recorded net outflows (€12.5 billion). These were linked to the issuance of structured securities in Germany.

Financial derivatives

Direct investment generated net capital imports of €3.8 billion in January (December: net capital exports of €6.7 billion). Non-resident enterprises injected their affiliated enterprises in Germany with direct investment funds worth €30.7 billion net. They increased their equity capital in German enterprises by €2.4 billion and granted intra-group loans in the amount of €28.4 billion. Conversely, domestic enterprises stepped up their foreign direct investment by €27.0 billion. They supplied foreign branches with additional equity capital of €10.5 billion, just over half of which took the form of re-invested earnings. Furthermore, they issued intra-group loans in the amount of €16.5 billion.

Direct investment generates net capital imports

Other statistically recorded investment – which comprises loans and trade credits (where these do not constitute direct investment), bank deposits and other investments – registered net capital exports amounting to €27.7 billion in January (following net capital imports of €24.9 billion in December). The Bundesbank's net claims grew by €89.4 billion. Although its TARGET2 claims declined by €110.8 billion, its liabilities from deposits by non-euro area residents fell even more sharply. Monetary financial institutions (excluding the Bundesbank) recorded net capital imports (€98.3 billion). Large-volume transactions of this kind with

Outflows in other investment

non-residents are not unusual at the beginning of the year; they mirror the countervailing transactions at the end of the year. Transactions by enterprises and households (€30.3 billion) and by general government (€6.2 billion) led to net outflows of funds abroad.

The Bundesbank's reserve assets grew slightly – at transaction values – by €0.3 billion in January. *Foreign reserves*

Monetary policy in a prolonged period of low interest rates – a discussion of the concept of the reversal rate

Since the financial and sovereign debt crisis, interest rates in the euro area have been at a low, sometimes even negative, level. This prolonged phase of low interest rates raises a question for monetary policymakers: could the effect of expansionary monetary policy measures on banks' lending reverse itself? The interest rate level at which such a reversal occurs is referred to in the literature on the subject as the "reversal rate". To hit a reversal rate, two conditions have to be met. First, the expansionary monetary policy measures must constrain the profitability and thus also the capital ratios of banks. Second, squeezed capital ratios must manifest themselves in reduced lending. If both conditions are satisfied, banks could respond to expansionary monetary policy measures by curtailing their lending.

During the period of low interest rates, expansionary monetary policy measures contributed to reducing the interest rate level in the euro area still further. Empirical studies show that a falling interest rate level depresses the net interest margin and thereby the profitability of banks above all when interest rates are already low. This kind of negative effect exerted on net interest margins by expansionary monetary policy measures can be offset by opposing effects, however. Falling interest rates tend to bolster macroeconomic developments, bringing down credit default risks and stimulating credit demand. While the negative effect on the net interest margin increases over time, this is unlikely to be the case for the positive effects. This is why the longer interest rates stay low, the greater the probability that expansionary monetary policy measures will exert a negative overall effect on the profitability and thus the capital ratios of banks. The first condition for the existence of a reversal rate is therefore more likely to be met the longer the period of low interest rates lasts.

The key factors for the second reversal rate condition are the banks' capital ratios and the regulatory capital requirements that they have to fulfil: if banks have capital ratios well in excess of the regulatory requirements, it is unlikely that a fall in those capital ratios will lead to a contraction in lending. This is because banks are most likely to respond to reduced capital ratios by cutting back on lending when they are operating with ratios only just over the requirements. In a banking system where the capital ratios of many banks lie barely above what is required by regulators, hitting the reversal rate is thus a possibility.

The reversal rate is unobservable and time-varying. It is therefore not possible to precisely quantify the reversal rate for the present situation. Nevertheless there exist indicators which allow us to assess whether the reversal rate has been encountered in the past. In particular, the evolution in the headroom between banks' capital ratios and regulatory requirements is of pivotal importance in this regard. Developments in this gap and additional indicators show no signs so far that the reversal rate has been reached before, in Germany or the euro area.

Introduction

Very low interest rates in the euro area since the financial crisis

In view of the financial and sovereign debt crisis and the very low rates of inflation in the euro area, the Governing Council of the European Central Bank (ECB) made multiple cuts to its policy rates in the years from 2009 to 2019. In June 2014, the deposit facility rate in the Eurosystem entered negative territory for the first time. Alongside this, the ECB Governing Council implemented additional monetary policy measures which contributed to a low general level of interest rates in the euro area. These include the various asset purchase programmes, such as the expanded asset purchase programme (APP) and the pandemic emergency purchase programme (PEPP) as well as the three series of targeted longer-term refinancing operations (TLTROs). The excess liquidity generated by these measures was a key driver behind money market rates following the interest rate on the deposit facility deep into negative territory. The APP also contributed to the lowering

of long-term capital market yields and thus had a flattening effect on the yield curve.¹

With interest rates sinking further and further and the period of low interest rates persisting for longer and longer, the question arose as to whether such a setting could, in fact, see the effect of monetary policy on banks' lending abating or even reversing. Based on the idea that the effect could end up working in the opposite direction, the term reversal rate was coined in the literature. It describes the interest rate level below which further monetary policy easing ceases to stimulate bank lending and instead constrains it. This article centres around explaining the concept of the reversal rate.

Reversal rate: interest rate level at which the effect of monetary policy reverses

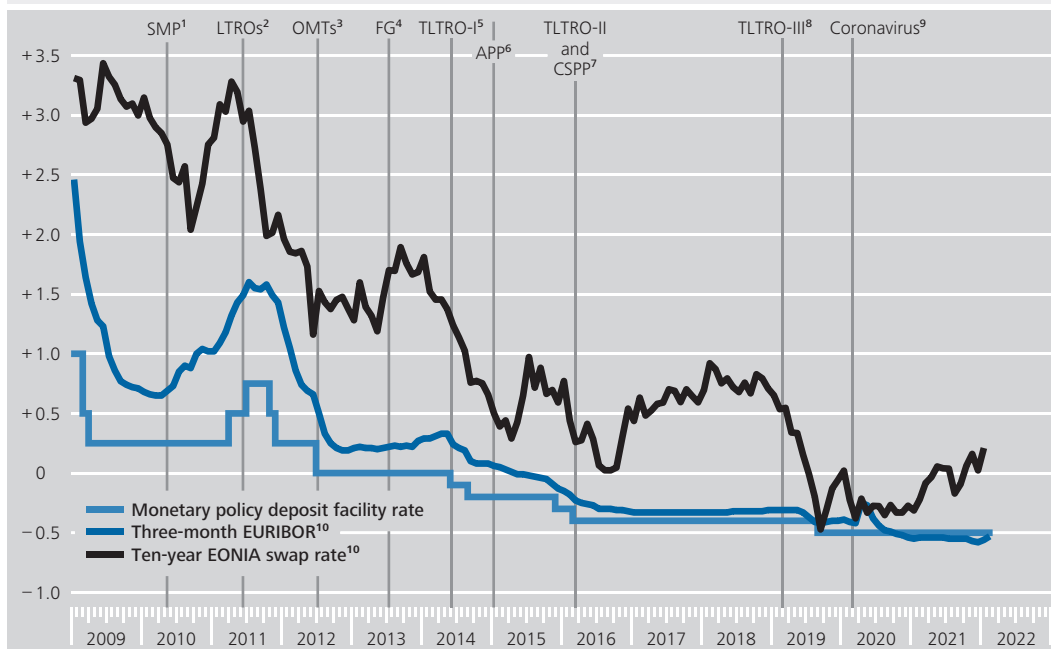

Monetary policy's influence on the general level of interest rates tends to depend on the set of instruments involved: very short maturities (particularly money market rates) are influ-

Monetary policy influences interest rate level across all maturities

enced by the conventional interest rate policy, medium-term maturities by forward guidance and long-term maturities by the asset purchase programmes.² But a host of other factors alongside monetary policy also have an impact on the long-term interest rate of an economy. Examples of other determinants include households' propensity to consume or save, enterprises' propensity to invest and the propensity of economic agents to assume risks or to convert assets into liquidity without complications.³

Upshot of empirical literature: net interest margin declines when the interest rate level is very low

The fear that monetary policy could hit the reversal rate was kindled by findings in the empirical literature suggesting that a very low, possibly negative, interest rate level tends to have a detrimental impact on banks' profitability:⁴ taken by itself, a period of low interest rates depresses banks' net interest margin⁵ and thereby their net interest income (the difference between interest income and interest expenditure) as bank interest rates decline more sharply on the income side than on the expenditure side. This is because banks tend to be reluctant to apply negative interest rates to customers' deposits. Where the interest rate level is very low and the period of low interest rates persists for longer and longer, there comes a point as of which deposit rates all but cease to be adjusted while lending rates continue to fall. The theoretical literature, too, shows that a key element increasing the probability of a reversal rate scenario is the fact that banks' funding costs decrease less than the income side.⁶

If banks do not compensate for the decline in their net interest margin, their profits fall, ceteris paribus

If banks are unable to compensate for the decline in their net interest margin through other revenue or cost components and/or higher lending, their profits decrease, ceteris paribus. This, in turn, makes it harder for banks to build up capital through retained earnings.⁷ The empirical literature shows that the longer the period of low interest rates lasts, the more net interest margins are squeezed.⁸ If the period of low interest rates persists over a long time,

banks thus need to make greater and greater adjustments to their business strategy if they wish to offset the influence of the decreasing net interest margin on their profitability.

A bank's capital ratio – its capital⁹ as a percentage of (risk-weighted) assets – is one of the factors determining its lending behaviour. One reason is because a change in the capital ratio will have an impact on the bank's funding costs. Empirical studies suggest that a lower capital ratio is associated with lower funding costs.¹⁰ Funding costs, for their part, are a central component of the lending rate.¹¹ Another reason is that banks have to comply with regulatory minimum capital requirements. Falling short of these requirements triggers supervisory intervention. If a bank is operating with a capital ratio in close proximity to the regulatory minimum, then it may curtail its lending to prevent an undershooting of the requirement. There are studies based on bank-level data which show that it is primarily banks with low excess capital buffers – i.e. the difference between the actual capital ratio and the capital ratio required for regulatory purposes – that scale back lending.¹²

Banks operating close to the regulatory minimum capital requirement will be inclined to curtail lending

Banks reducing their lending in a period of low interest rates because they are capital-constrained does not necessarily mean that the reversal rate has been reached, however. The

Reversal rate scenario: expansionary monetary policy measures responsible for curtailment of bank lending

academic literature only refers to this if the curtailment of lending can be attributed to the expansionary monetary policy stance. This means two conditions must be satisfied before we can say that a reversal rate scenario has occurred (see the chart above):

- the expansionary monetary policy stance weighs on profitability and thus banks' capital endowment and ...
- ... the erosion of the capital endowment causes banks to reduce their lending.

Looking at the two necessary conditions, this article discusses the concept of a reversal rate in the light of the existing theoretical and empirical literature and explores the monetary policy implications.

Discussion of the conditions required for the existence of a reversal rate

Monetary policy and banks' capital endowment

The economic literature shows that monetary policy measures influence banks' capital endowment and thus potentially their lending choices by acting on the institutions' profitability.¹³ This monetary policy transmission channel has grown in significance during the prolonged period of low interest rates in the large currency areas. According to results found in the empirical literature, the relationship between the interest rate level and banks' net interest margin depends on how high the interest level is. Especially when the interest rate level is low, the empirical literature finds that a further reduction in that level leads to a decreasing net interest margin.¹⁴ This positive relationship between the interest rate level and the net interest margin also becomes stronger if the interest rate level falls still further,¹⁵ for it is particularly when interest rates are low that income on the assets side of the bank's balance sheet will respond more sharply to the change in the interest rate level than the costs on the liabilities side.¹⁶ This response of varying intensity is also extremely important in the highly regarded the-

Reduction in net interest margin amplified in periods of low interest rates when interest rate level sinks further

¹³ For details on what is referred to as the "bank capital channel" of monetary policy, see Van den Heuvel (2007). See also Chami and Cosimano (2010) and Disyatat (2011); these papers do not directly make use of the term "bank capital channel" but still describe a monetary policy transmission channel through which monetary policy measures are propagated via the profitability and capital endowment of the banking system.

¹⁴ See Claessens et al. (2018) and Klein (2020).

oretical model of Brunnermeier and Koby (2019) (see the box on pp. 22 ff.).¹⁷

Net interest margin decreases the longer the period of low interest rates lasts

Furthermore, the negative impact exerted by a low interest rate level on the net interest margin increases the longer the level stays low.¹⁸ One reason is that, over time, older, higher-interest loans gradually mature and are replaced by new loans at lower rates of interest. The other reason is that interest rates on customer deposits do not fall to the same extent as lending rates. Experience during the period of low interest rates in the euro area shows that, in the aggregate, banks hardly ever apply negative interest rates to customer deposits: the volume-weighted interest rate aggregated across all customer deposits has settled at just over the zero mark in most euro area countries. This also reduces the income that banks generate on the funding side (liabilities-side margin contribution¹⁹). When interest rates are at a “normal” level, the interest on customer deposits averages out at lower than the interest rate on the interbank market, meaning that banks generate a profit through the liabilities-side margin contribution. However, this changes in a period of low interest rates: because the interest rate on customer deposits falls less sharply than interest rates in the interbank market, the liabilities-side margin contribution shrinks or even turns negative.²⁰ The longer the period of low interest rates lasts, the greater the contraction in both sources of revenue usually tapped in classical loan/deposit business – the net interest margin and the liabilities-side margin contribution.

Monetary policy affects banks’ profitability via various channels

A negative effect of a low interest level on the net interest margin is a necessary, but not sufficient, condition for monetary policy to have a negative impact on banks’ profitability and thus on their capital. This is because monetary policy has a positive impact on banks’ profitability through various channels, for example via macroeconomic developments. The more favourable these developments are, the lower the average default risk. Lower credit risk, in turn, drives down banks’ loan loss provision-

ing.²¹ Lower levels of loan loss provisioning reduce banks’ expenditure and therefore have a positive effect on their profitability.²² In addition, favourable macroeconomic developments stimulate loan demand. This can enable banks to compensate for the decreasing net interest margin – at least in part – through a greater lending volume.

The low interest rate period seen in the euro area over the past decade tended to be characterised by favourable economic developments. Monetary policy accommodation is likely to have played a part in this development. In addition, one-off valuation gains on account of monetary policy easing improved banks’ profitability. These positive effects of low interest rate policy on banks’ profitability must be weighed up against the negative effect on the net interest margin, as a reversal rate can only be achieved if the overall effect of monetary policy measures on banks’ profitability, and thus their capital, is negative.²³

While the pressure on the net interest margin increases with the duration of the low interest rate phase, this is unlikely to apply to the positive effect on loan loss provisioning via eco-

Expansionary monetary policy also positively affects banks’ profitability through the positive impact on the economy

¹⁷ Similarly to Brunnermeier und Koby (2019), in the model of König und Schliephake (2021) a reduction in the interest margin as a result of monetary policy easing causes a reversal rate to arise, too. In contrast to the model of Brunnermeier and Koby (2019), however, it is not the binding effect of a regulatory capital requirement which provokes such a scenario; rather, in the model of König und Schliephake (2021), the pressure on profitability leads banks to increase risk-taking and this, taken by itself, leads to higher lending rates and a reduction in lending. If risk appetite increases to a sufficient degree, a reversal rate can be reached in this model context as well.

¹⁸ See Altavilla et al. (2018) and Claessens et al. (2018).

¹⁹ The liabilities-side margin contribution is the spread between a customer deposit and wholesale funding with the same maturity.

²⁰ See Deutsche Bundesbank (2018).

²¹ Lower credit risk also reduces banks’ stock of risk-weighted assets. If the stock of risk-weighted assets declines, the denominator of the risk-weighted capital ratio falls and thus, taken in isolation, drives up the ratio.

²² At the same time, however, the relationship postulated in the risk-taking channel could also occur, according to which low interest rates raise banks’ risk appetite, which is likely to push up their loan loss provisioning (see, inter alia, Borio and Zhu (2012)).

²³ For information on the calculation of such a net effect for the euro area, see Boucinha and Burlon (2020).

Theoretical concept of the reversal rate

The concept of the reversal rate was developed in a model-theoretical paper by Brunnermeier and Koby (2019). In this model, the stylised bank holds loans and debt securities on the assets side of its balance sheet. On the liabilities side are customer deposits and equity capital. In the model, monetary policy is implemented by means of a single interest rate. The interest rate applied to debt securities always corresponds to this monetary policy rate, and is therefore a given from the bank's perspective. The bank sets both its lending and deposit rates with a view to maximising its profit. The volume of the bank's lending decreases given a rising lending rate, while deposits increase when the deposit rate climbs.

The bank's balance sheet structure must satisfy two conditions.

- First, the bank must hold debt securities in at least the amount of a predetermined share of its customer deposits. This can be interpreted as a provision put in place to guarantee liquidity.¹
- Second, the bank must hold equity capital in at least the amount of a predetermined share of the loans that it grants. This condition reflects a regulatory capital requirement.

If one of these conditions restricts the bank's business policy, this condition becomes binding. This means that, in such an event, the bank must pursue a different business policy than it would in the absence of this binding condition. The amount of capital necessary to fulfil the second condition comprises two components: exogenous capital at the start of the period under

review and the bank's net interest income at the end of this period. The latter is equivalent to the difference between interest income from lending and debt securities and interest expenditure on customer deposits. Net interest income thus results from investment activities decided upon by the bank during the period under review. This means that the bank's relevant capital endowment in this period is forward-looking, as it already includes income and expenditure stemming from investment activities in this period.²

If the monetary policy rate declines, so too does the interest income the bank receives via debt securities. This reduces net interest income and therefore the bank's capital endowment.³ Provided that no binding effect results from the two aforementioned conditions, the bank reacts to a monetary policy rate cut by expanding its lending. This is because from the bank's perspective, granting loans becomes more attractive relative to holding debt securities when the monetary policy rate – and therefore the rate of interest on debt securities – decreases. The monetary policy rate ultimately represents the interest rate of the bank's only alternative investment instrument and thus depicts the opportunity costs of lend-

¹ In reality, such provisions are more complex. In the European Union, for instance, the liquidity coverage requirement (LCR) and the net stable funding ratio (NSFR) are in force.

² See also Repullo (2020).

³ In the model of Brunnermeier and Koby (2019), a monetary policy rate cut additionally results in valuation gains, which in turn increase the bank's capital endowment when taken in isolation. Theoretically, however, the volume of such gains could be assumed to be equal to zero without changing the underlying mechanism of the model. For more on this, see Repullo (2020). This channel is therefore excluded from the presentation of the model in the remainder of this box.

ing. The bank can expand its lending by lowering the lending rate. The interest rate on deposits is also lowered following a decline in the monetary policy rate as a response to decreased opportunities to generate interest income. Despite these adjustment reactions, the bank in the model cannot prevent its net interest income from contracting due to falling interest rates on debt securities and lending.

The sharper the decline in the monetary policy rate, the lower the bank's net interest income and thus its equity capital, too. At the same time, the bank will want to lend at higher volumes the sharper the decline in the monetary policy rate turns out to be. However, this requires the bank to have the necessary capital at hand. If the monetary policy rate falls below a certain level, the bank is no longer able to expand its loan volume to the desired extent, as it is constrained by its capital endowment. From this point onwards, capital requirements become binding, and the volume of loans that the bank is able to grant is determined solely by its capital endowment. The monetary policy rate at which this binding effect of capital requirements comes into play is the reversal rate. Below this interest rate, a further decline in the monetary policy rate results in a decreasing loan volume.

In Brunnermeier and Koby's model, the existence of a reversal rate is ultimately due to the fact that a declining interest rate level results in banks' income sinking faster than their expenditure. This asymmetry in the reactions of income and expenditure can also be seen in the empirical literature on the impact of the low interest rate environment,⁴ which often justifies this observation by the fact that banks are hesitant to apply negative interest rates to customer deposits.⁵

In the model, however, the existence of this asymmetry is based on another assumption: namely that banks are required to invest in debt securities (assets side) but may not use them to finance themselves (liabilities side).⁶ Debt securities are, in the model, the only bank asset for which the interest rate applied is directly determined from the monetary policy rate. A monetary policy rate cut thus implies that interest income generated by a bank's assets will decline. That being said, no corresponding decline in funding costs will occur, as these are directly determined only by the interest rate on customer deposits.

Repullo (2020) abandons this restrictive assumption with regard to the bank's funding structure. He analyses the consequences of the bank being granted the additional option of also financing itself via debt securities within the context of Brunnermeier and Koby's model. Overall, the existence of the reversal rate in the model is dependent on the bank's net position in debt securities,⁷ as this net position dictates how a decline in the monetary policy rate will affect the bank's profits. If the bank finances itself via debt securities to a greater extent than it invests in them (net borrower in debt securities), a monetary policy rate cut in the model will decrease the bank's interest expenditure more significantly than its interest income. Consequently, the monetary policy

⁴ See, for instance, Busch and Memmel (2017), Claessens et al. (2018) and Klein (2020).

⁵ See, for example, Busch and Memmel (2017) and Heider et al. (2019).

⁶ In their paper, Brunnermeier and Koby indicate that a lower bound on the deposit rate is not essential for the existence of a reversal rate in the context of their model. If there is such a bound, however, the reversal rate is higher the higher the bound is set.

⁷ Other investment and funding options such as the interbank market can be substituted for debt securities here. The deciding factor is that the rate of interest applied to the investment and funding options examined is directly determined by the monetary policy rate and is a given from the bank's perspective.

rate cut boosts the profitability and therefore the capital endowment of a bank such as this. This is why there is no reversal rate for such a bank in the model. In this connection, then, the key role of the net position in debt securities is conditional on a number of assumptions in the model.⁸ In reality, these are unlikely to be fully met. Generally, it can therefore be assumed that alongside the net position in debt securities, other factors are key when it comes to determining how a monetary policy rate cut will affect a bank's profits and whether or not a reversal rate exists.

Another core assumption made in Brunnermeier and Koby's model is that the bank cannot increase its capital through the issuance of equity instruments. In the model, the bank's capital endowment, which is key to the fulfilment of its capital requirements, is determined solely on the basis of an exogenously given initial capital endowment and the bank's net interest income. Repullo demonstrates that a lack of opportunities to issue equity instruments is decisive for the existence of a reversal rate. He considers a model in which the bank not only issues debt securities but is also able to raise capital via the market. It may do the latter to any extent it desires, as long as it generates the return required by the equity investors (shareholders). This is assumed to correspond to the monetary policy rate plus a constant mark-up.

In Repullo's model, two variables determine the bank funding costs that are instrumental to lending: namely the return required by shareholders and the interest rate on the debt securities issued by the bank. If the monetary policy rate declines, both the interest rate on debt securities and the return required by shareholders fall, too. In response to declining funding costs, the bank lowers its lending rates and expands

its lending. In Repullo's model, then, as long as the bank generates the return required by shareholders, a decrease in the monetary policy rate always results in an expansion of lending. A scenario matching that of Brunnermeier and Koby's model, in which a decline in the monetary policy rate can entail a decrease in banks' lending, is therefore precluded in Repullo's model.

In the event that the bank cannot generate the return required by the shareholders, however, it must exit the market in Repullo's model. The prerequisites for this are the monetary policy rate being lowered to a negative level, banks being unable to decrease their deposit rate to under zero and, at the same time, not being able to reject depositors. In such a setting, losses from deposit-taking may rise to the extent that it becomes impossible for the bank to obtain sufficiently high profits from lending to generate the returns required by the shareholders. In Repullo's model too, therefore, a monetary policy rate cut below a certain level could, in principle, have a contractionary rather than an expansionary effect on lending. However, the consequences of such an adverse scenario are very serious in this model: no more lending will take place at all as the bank has closed down.⁹

⁸ Here, the assumption that the volume of loans and deposits only depends on the lending rate or the deposit rate respectively, in particular, seems to be key. On the basis of this assumption, a bank that is a net borrower in debt securities can always improve its profitability in the event of a monetary policy rate cut. If it leaves its balance sheet structure unchanged, interest income and interest expenditure from lending and deposit business will remain the same. However, interest expenditure for debt securities issued declines more sharply than interest income on debt securities held. As a result, the bank's net interest income increases overall. If, by contrast, borrowers and depositors also react to a monetary policy rate cut when the interest rates on lending and deposits remain unchanged, the bank's profitability could deteriorate even if it is a net borrower in debt securities.

⁹ The bank under review in Repullo's model is a monopolist in a local market.

This result is attributable to the fact that the bank in Repullo’s model first has to raise the entirety of its equity capital for the period under review. Alternatively, it can be assumed, as in the model of Brunnermeier and Koby, that the bank has a starting amount of capital carried over from the previous period at the beginning of the period under review. In this scenario, the bank would receive no new equity capital from its investors if it was unable to fulfil their requirements with regard to returns on their investment. The bank could, however, use equity capital from its initial capital endowment for lending purposes, meaning that it would not have to exit the market. A reversal rate scenario similar to that seen in the model of Brunnermeier and Koby would then be conceivable in principle: if the bank does not receive any new equity capital, it may potentially conduct less lending business following an interest rate cut than

would otherwise have been the case. For if the monetary policy rate were higher, the loss incurred from deposit-taking would be lower. This could then make it possible for the bank to generate the return required by the shareholders, to obtain new equity capital and therefore to grant more loans than in the lower monetary policy rate scenario. If the loss entailed by deposit-taking activities was so high that the bank also recorded a loss overall, this would, in addition, exhaust the available capital over time. The bank would then have to successively scale back its lending even more over the following periods relative to a higher monetary policy rate scenario.

Likelihood of a negative overall effect of monetary policy increases the longer the period of low interest rates lasts

economic developments. In addition, the valuation gains incurred with each interest rate cut only have a one-off positive effect on profitability. Therefore, the likelihood of a negative overall effect of monetary policy on banks’ profitability, and thus on their capital base, increases with the duration of the low interest rate phase.

Significance of capital for lending

Two channels are key to the relationship between the capital ratio and lending

A bank’s capital ratio can influence its lending and the lending rates it charges.²⁴ Two key channels can be distinguished here.

- The first channel operates via the bank’s total funding costs (hereinafter referred to as the “funding costs channel”).
- The second channel focuses on the binding force of regulatory capital requirements

(hereinafter referred to as the “capital requirement channel”).²⁵

Funding costs channel

The funding costs channel is derived from the influence of the capital ratio on the total funding costs²⁶ of a bank.

A bank’s capital ratio influences its funding costs

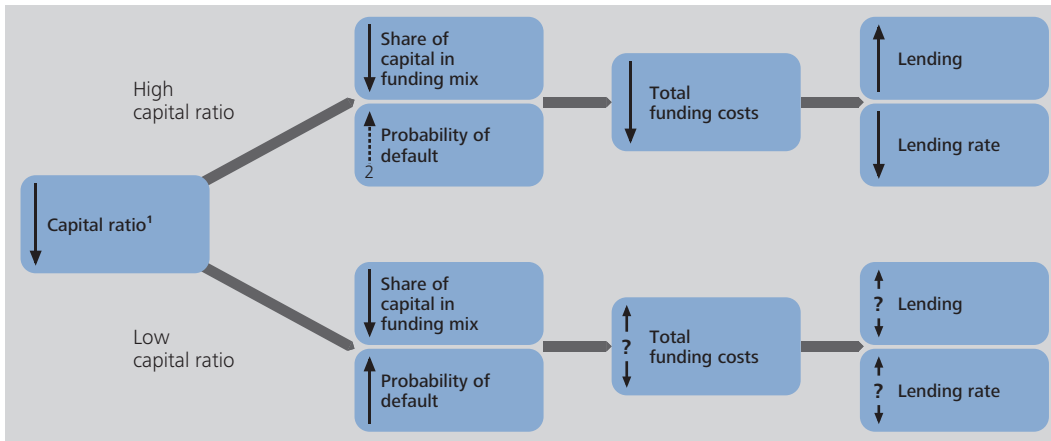

- A higher capital ratio reduces the risk of a bank failing, meaning that the costs per unit of equity and debt decrease. As a result,

²⁴ The capital ratio is the ratio between the level of a bank’s capital and the total assets or risk-weighted assets. Hereinafter the term “capital ratio” encompasses both possible definitions. By contrast, we will omit below the fact that different types of capital ratio exist, each differing in terms of which instruments are counted as capital in the numerator.

²⁵ The regulatory capital requirement sets the size of the minimum capital ratio. The difference between the capital ratio and the regulatory capital requirement is the excess capital buffer.

²⁶ Here and in the remainder of this article, the term “total funding costs” always refers to the ratio between total funding costs in absolute terms and total assets.

Significance of capital for lending: the funding costs channel

1 Ratio of capital to total assets. 2 Only a weak increase.
 Deutsche Bundesbank

taken in isolation, the bank's total funding costs fall.

- A higher capital ratio also leads to a shift in the funding mix from debt to equity.²⁷ Given that equity is normally associated with higher costs for a bank than debt – since equity is riskier for investors than debt – this results in higher total funding costs for a bank when viewed in isolation.²⁸

Relationship between capital ratio and funding costs likely to be non-linear

Which of the two relationships mentioned above is dominant – and thus determines whether the overall relationship between the capital ratio and the total funding costs is positive or negative – depends on the size of the capital ratio (see the chart above). If the capital ratio is low, a bank's risk of default is likely to rise more strongly as a result of a given drop in the capital ratio than in the case of a high ratio. Consequently, the costs per unit of equity and debt probably also increase more sharply in such a scenario, meaning that the relationship between the capital ratio and total funding costs is not linear. Arnould et al. (2020) do in fact find evidence of such non-linearity in the euro area.

Empirical studies mostly conclude that a lower capital ratio reduces total funding costs (this corresponds to the upper branch in the chart above).²⁹ However, they typically disregard ef-

fects that the capital ratio has on the costs per unit of debt as well as the non-linearity mentioned above. Therefore, their informative value for banks with low capital ratios is possibly only limited. For other banks, these empirical findings mean that their total funding costs decrease if their capital ratio falls.

Since banks typically pass a change in their total funding costs through to borrowers, a falling lending rate tends to be expected if the capital ratio declines.³⁰ On account of the non-linearity mentioned above, however, the direction of this relationship could change if the capital ratio is sufficiently low.

Empirical studies indicate positive relationship between capital ratio and funding costs

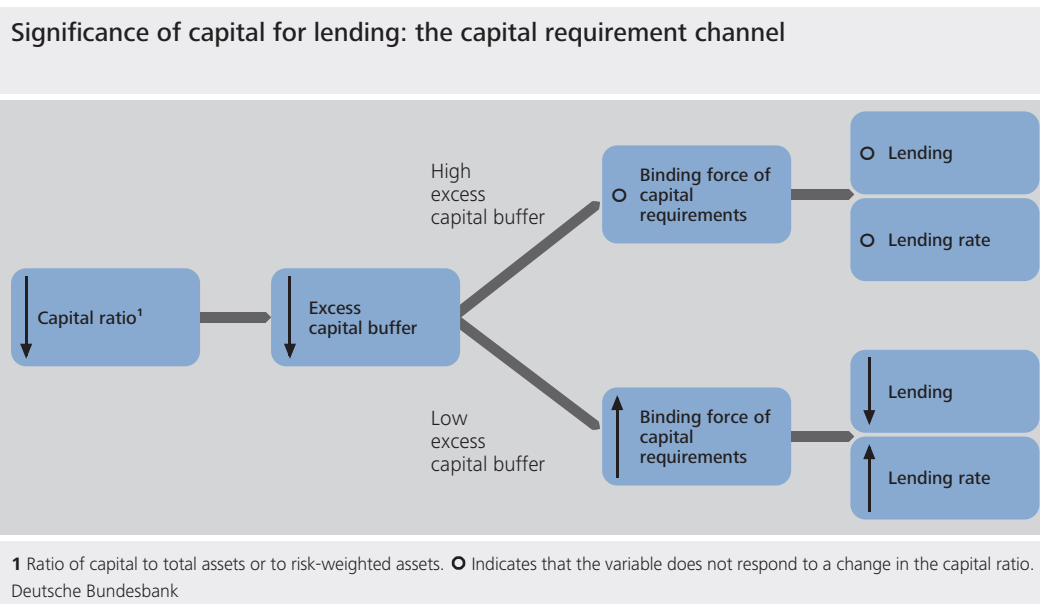

Positive relationship between capital ratio and lending rate if banks pass changes in funding costs through to borrowers

²⁷ This only applies to a capital ratio based on risk-weighted assets if the capital ratio based on total assets increases at the same time. This is the case if capital increases and/or total assets decrease.

²⁸ The higher risk involved for equity providers stems from the fact that losses initially cause a reduction in capital. Debt is only affected once equity is exhausted. Moreover, equity funding is also more expensive for banks because, unlike debt funding costs, they cannot be deducted from taxable profits.

²⁹ For more information on this topic, see, for example, Miles et al. (2012). See Birn et al. (2020) for an overview of the literature. According to this literature overview, empirical studies typically find that the decline in the costs per unit of equity only offsets up to around 50% of the increase in funding costs resulting from a rise in the share of equity in the funding mix.

³⁰ For instance, Illes et al. (2015) find that banks in the euro area pass a large part of a change in their funding costs through to their customers by adjusting their lending rates. However, the funding costs observed here do not include capital costs.

Capital requirement channel

Binding force of regulatory capital requirements leads to constraints in lending

The capital requirement channel stems from the binding force of a regulatory capital requirement. Such a binding force exists if a bank lends less than it would in the absence of this requirement. If a bank's new loans exceed those that are repaid or default, its credit volume grows and thus the denominator of its capital ratio. Therefore, ceteris paribus, the capital ratio falls if lending increases. If a bank's excess capital buffer is low, it potentially has to cut back on its lending to avoid its capital ratio falling. In this context, banks do not wait until they would otherwise violate regulatory capital requirements to constrain their lending. Instead, it seems plausible that they strive for a target capital ratio above the regulatory capital requirement.³¹ They could therefore already constrain their lending at the point where their capital ratio would otherwise fall below their target capital ratio. A target capital ratio provides a bank with a certain degree of flexibility: first, it creates scope for a potential expansion of lending in future. Second, a bank can thus hedge against unexpected events, meaning that losses do not immediately cause it to undershoot regulatory capital requirements.

The capital requirement channel is based on the assumption that banks are unable to issue

equity instruments to stabilise their excess capital buffer. This is likely to be the case for many unlisted banks.³² Yet, even for listed banks this way of raising capital is probably not always possible without any constraints (see also the box on pp. 22 ff.). It therefore also cannot be ruled out that these banks will cut back on their lending if their excess capital buffer is too low.

Therefore, as a general rule: the lower a bank's excess capital buffer, the higher the likelihood that the regulatory capital requirement exerts a binding force on its lending.³³ A bank is likely to curtail its lending if its excess capital buffer falls below the target capital ratio.³⁴ The greater the extent to which the excess capital buffer undershoots the target level, the greater the restrictions on lending are likely to be. This results in a positive relationship between a bank's excess capital buffer and its lending below a cer-

Capital requirement channel is conditional upon banks not issuing equity instruments to counter a low excess capital buffer

Capital requirement channel tends to suggest a positive relationship between the excess capital buffer and lending. ...

³¹ See, inter alia, Berger et al. (2008), Deutsche Bundesbank (2018) and Couaillier (2021).

³² In Germany, unlisted banks – such as cooperative banks and savings banks – make up a significant part of the banking sector.

³³ See Imbierowicz et al. (2020); Bank for International Settlements (2021), pp. 31-33; Berrospide et al. (2021); and European Central Bank (2021), pp. 106-114.

³⁴ Here and in the rest of this article, it is implicitly assumed that curtailment (expansion) of a bank's supply of credit is associated with a curtailment (expansion) of its lending.

tain excess capital buffer level. For a given regulatory capital requirement, this implies, at the same time, that a falling capital ratio is associated with a decline in lending below a certain level of the excess capital buffer (see the lower branch in the chart on p. 27). By contrast, if the excess capital buffer is sufficiently high, lending does not respond to a change in the capital ratio according to this channel (see the upper branch in the chart on p. 27).

... and therefore a negative relationship between the excess capital buffer and lending rate

Since credit demand typically falls as the lending rate rises, a bank can cut back its lending by raising the lending rate. Consequently, a negative relationship between a bank's excess capital buffer and the lending rate can be derived from the above considerations if this buffer drops below a certain level. For a given regulatory capital requirement, a negative relationship consequently also exists between a bank's capital ratio and the lending rate if the capital ratio falls below a certain level.

The relationships outlined initially only apply to the capital requirement channel presented in this section. The overall relationship between a bank's capital ratio and its lending hinges on the interaction between the funding costs channel and the capital requirement channel. The overall impact of both channels will be discussed in the next section.

Joint examination of both channels

The funding costs and capital requirement channels imply opposite signs for the relationship between the capital ratio and lending.

- The funding costs channel tends to give rise to a negative relationship between the capital ratio and lending, which is most likely to become apparent if the capital ratio is high.
- By contrast, the capital requirement channel gives rise to a positive relationship between the excess capital buffer and lending if the excess capital buffer is low. For a given regulatory capital requirement, this also results in

a positive relationship between a bank's capital ratio and its lending.

All in all, the relationship between the capital ratio and lending – and thus also the relationship between the capital ratio and the lending rate – therefore depends on the size of the excess capital buffer. If the excess capital buffer is sufficiently low, a decline in capital leads to a reduction in lending and to a rise in the lending rate. This is also suggested by the results of an empirical study conducted by the Bundesbank (see the box on pp. 29 ff.) For banks in Germany, these results indicate that a decline in the capital ratio tends to be associated with an increase in the lending rate on loans to non-financial corporations if banks' excess capital buffer is low. This relationship is reversed in the case of large excess capital buffers. The results of the study also suggest that the non-linear relationship has strengthened during the coronavirus pandemic, with a decline in the capital ratio during the pandemic resulting in a stronger rise in the lending rate for banks with a low excess capital buffer than prior to the pandemic. A decline in the capital ratio caused the lending rate for banks with a high excess capital buffer to fall more sharply than before the onset of the pandemic. A simple aggregate analysis does not provide any evidence to suggest that an increase in lending rates due to a decline in the capital ratios is currently likely in the German banking system. This is because banks' excess capital buffers are too high on average for a negative relationship to be expected. Thus, the empirical study shows no indication that German banks currently meet the second necessary condition for reaching a reversal rate.

Overall, both channels suggest a non-linear relationship between the capital ratio and lending

Both channels with reversed signs

Time variability of the reversal rate

Thus far, the article has identified two necessary conditions for a reversal rate to materialise.

Reversal rate time-varying and unobservable

The relationship between banks' capital and lending rates: econometric analysis based on AnaCredit credit data statistics

This box presents an analysis of the relationship between the capital ratios of banks in Germany and the lending rates they charge. The principal focus here is on whether this relationship exhibits non-linearities. The analysis is conducted at the individual loan level for the period from July 2019 to October 2021. AnaCredit credit data statistics, prudential reporting data and credit institutions' balance sheet statistics data serve as the data basis. The analysis focuses on interest rates on new loans to non-financial corporations.¹ The estimation sample comprises around 430,000 observations, of which approximately 150,000 are from 2019, 180,000 are from 2020 and roughly 100,000 are from 2021. Data from AnaCredit and the balance sheet statistics are available at the monthly level, the prudential data at the quarterly level.

To determine the empirical relationship, the interest rate on a loan is regressed on different loan and bank-side variables. The analysis takes place at the individual loan level and all loans are equally weighted in the estimation.² Fixed effects are included to control for borrower-side and macroeconomic influences on the lending rates. Formally, the estimation can be described by the following equation:

$$\begin{aligned}
 R_{i,b,f,m} = & \beta_1 * EK_{b,q-1} + \beta_2 * EK_{b,q-1}^2 \\
 & + \beta_3 * Reg_{b,q} + \beta_4 * Reg_{b,q}^2 \\
 & + \beta_5 * EK_{b,q-1} * Reg_{b,q} \\
 & + \beta'_6 * \mathbf{b}_{b,q-1} + \beta'_7 * \mathbf{k}_{i,b,f,m} \\
 & + \beta'_8 * Covid_m * \mathbf{k}_{i,b,f,m} + \lambda_{f,q} \\
 & + \delta_m + \varepsilon_{i,b,f,m}
 \end{aligned}$$

$R_{i,b,f,m}$ is the interest rate on the loan i , which was newly granted in month m by

bank b to an enterprise from group f (see below for a definition of this group). $EK_{b,q-1}$ is the capital ratio – lagged by one quarter – of bank b .³ As outlined in the main text, it is to be expected that the relationship between the capital ratio and the lending rate is non-linear. To take this into account, the squared capital ratio $EK_{b,q-1}^2$ from the previous quarter $q-1$ is incorporated into the estimation. As a bank's excess capital buffer is likely to be paramount for the binding effect of regulatory capital requirements (see the main text), the regulatory capital requirement of the respective bank $Reg_{b,q}$ from the current quarter q is also incorporated into the estimation (the original and squared value, respectively).⁴ In this way, the regulatory capital requirement is kept constant, which means that a rise (fall) in the capital ratio in the estimation model increases (reduces) the excess capital

¹ The focus is on this loan category as lending to non-financial corporations, in particular, plays a key role from a monetary policy perspective.

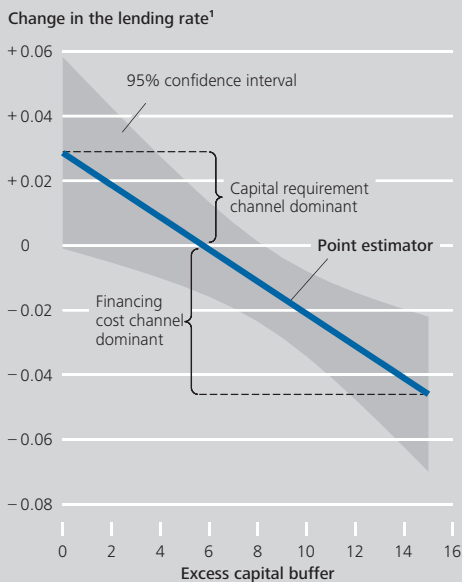

² Loans to enterprises from the sub-sector "Wholesale and retail trade and repair of motor vehicles and motorcycles" make up by far the largest share of new loans to non-financial corporations in terms of the number of loans granted. The results of the estimations presented here are therefore very sensitive to the (non-)inclusion of these loans in the estimation sample. The share of these loans in the underlying credit volume is, however, significantly smaller than their share in the number of loans granted. To prevent loans to this sector from having a decisive influence on the estimation results, they were removed from the estimation sample.

³ The capital ratio is calculated as the ratio of a bank's Common Equity Tier 1 (CET1) capital to its risk-weighted assets.

⁴ The term "regulatory capital requirement" here and below refers to the ratio of required CET1 capital to the bank's risk-weighted assets. The capital requirement used here includes (binding) capital add-ons under the Pillar 2 requirement and required buffers, but not (non-binding) capital add-ons under the Pillar 2 guidance. As (binding) capital add-ons and some of the buffer requirements are bank-specific, the requirement varies across the banks in the sample.

Effect of a reduction in the capital ratio on the lending rate*

Percentage points

* Reduction in the capital ratio of 1 percentage point depending on the size of the excess capital buffer. A constant regulatory capital requirement (ratio of required CET1 capital to risk-weighted assets) equal to the sample median is assumed. **1** Interest rate on new loans to non-financial corporations.

Deutsche Bundesbank

buffer by the same amount, ceteris paribus. In addition, the inclusion of the interaction term $EK_{b,q-1} * Reg_{b,q}$ takes account of the fact that the marginal effect of the capital ratio on the lending rate might depend on the size of the regulatory capital requirement. The vector $\mathbf{b}_{b,q-1}$ comprises other bank-side variables: the share of non-performing loans in total loans, the share of excess liquidity⁵ in total assets as well as the size of the respective bank's total assets.⁶ The vector $\mathbf{k}_{i,b,f,m}$ consists of the loan-side variables, including the volume, collateral, purpose⁷ and maturity of the respective loan. The dummy variable $Covid_m$ takes the value of 1 after the outbreak of the coronavirus pandemic in March 2020, and the value of 0 beforehand. On account of the interaction between the vector $\mathbf{k}_{i,b,f,m}$ and the dummy variable $Covid_m$, the effects of the loan-side variables can vary before and after the onset of the coronavirus pandemic. Fixed effects are included to control

for enterprise-side factors: for every quarter, a fixed effect $\lambda_{f,q}$ is incorporated for each group f of enterprises in the same sector that are of a similar size and from the same region.⁸ The time-fixed effects at the monthly level δ_m collectively capture the influence on lending rates of all variables that vary over time but not across banks, firms and loans. This replaces the inclusion of a series of possibly relevant macroeconomic variables such as capital market yields, monetary policy rates or inflation rates. The variable $\varepsilon_{i,b,f,m}$ is an error term. When calculating the standard errors of the estimators, the error terms are clustered at the quarterly bank level.

The results of the analysis indicate that the effect a bank's capital ratio has on the lending rates it charges is indeed non-linear. The adjacent chart shows that a decline in the capital ratio tends to be accompanied by an increase in the lending rate if the level of the bank's excess capital buffer is low. However, this effect is not significantly different from zero. By contrast, if the level of the excess capital buffer is sufficiently high, then a decline in the capital ratio leads to a decrease in the lending rate.⁹

In a further estimation, the estimation period was limited to the period after the

⁵ In this context, only excess liquidity that exceeds the exemption allowance is taken into account.

⁶ Some of the variables in the vector $\mathbf{b}_{b,q-1}$ are available at a monthly frequency; these are lagged by three months.

⁷ Possible forms of the variable "purpose" are, for example, construction investment or the financing of working capital.

⁸ See Degryse et al. (2019). The results presented below are largely robust if, alternatively, for each quarter one fixed effect per enterprise is incorporated into the estimation.

⁹ Owing to the effect of the interaction between the capital ratio and regulatory capital requirement contained in the estimation, the straight line shown in the chart shifts if the requirement is fixed at a different level.

outbreak of the coronavirus pandemic.¹⁰ The results suggest that the relationship between the capital ratio and lending rates has intensified with the pandemic. For both small and large excess capital buffers, there is a stronger effect in terms of absolute value than in the estimation for the entire period. The effect is also significantly different from zero for small excess capital buffers.

The results indicate that banks with small excess capital buffers may strive to stabilise their capital ratios and thus their excess capital buffers. They seem to respond to a decline in their capital ratios by increasing lending rates in order to slow their lending. This suggests that the regulatory capital requirement has a binding effect on banks with small excess capital buffers: affected banks seek to avoid a further decline in their excess capital buffers in order to reduce the risk of breaching the regulatory capital requirement. To that end, they adjust their lending policies to developments in their capital ratios. By contrast, for banks with large excess capital buffers, the binding effect of the regulatory capital requirement is likely to play a less significant role. According to the chart, these banks respond to a decline in their capital ratios by reducing lending rates. This is likely to reflect the positive relationship between funding costs and the capital ratio: a lower capital ratio tends to be accompanied by lower total funding costs (see the main text). The banks then pass on the lower funding costs to their customers in the form of lower lending rates.

This interpretation of the results is also consistent with the fact that the relationship between capital and lending rates intensified after the coronavirus pandemic began. First, banks' capital costs probably rose during the pandemic.¹¹ Therefore, the positive

relationship between capital ratios and funding costs is likely to have intensified. Second, the heightened uncertainty triggered by the pandemic probably led banks with small excess capital buffers to respond more sensitively to a change in their capital ratios. If their capital ratios fall, these banks therefore seem to increase their lending rates more sharply than before the pandemic, despite the higher capital costs.

Based on the estimation results, the effect of the capital ratio on lending rates can be calculated for each bank.¹² The weighted average effect across all banks can then be calculated. The respective level of the outstanding volume of loans supplied to non-financial corporations acts as a weight. This means that those banks that play a bigger role in this loan segment are given a greater weight in the average. It turns out that the weighted average effect of a reduction in the capital ratio on lending rates is slightly negative. There is therefore no direct indication that a decline in German banks' capital ratios might currently prompt an increase in lending rates on loans to non-financial corporations on aggregate.

One caveat to be noted is that the analysis presented here is based on the assumption that a bank's capital ratio in the preceding quarter is exogenous. This implies that the bank gears its lending rates to this given

¹⁰ The dummy variable *Covid_m* and the interaction terms formed with it are then eliminated from the estimation as the dummy variable, by necessity, takes the value 1 for all observations.

¹¹ See Altavilla et al. (2021).

¹² As described above, the squared capital ratio is used in the estimation. Furthermore, it is interacted with the regulatory capital requirement. For this reason, the effect of the capital ratio depends on the level of the capital ratio itself and the level of the regulatory requirement. As these variables differ from bank to bank, this results in an individual effect of the capital ratio for each bank. The bank-specific values for these variables from the third quarter of 2021 were used in the calculation.

capital ratio. In reality, however, the direction of impact might also be the reverse: a bank that wants to expand its lending might already increase its ratio beforehand by raising new capital in the market, for example. If so, lending possibilities today would be a determinant of the development of the capital ratio in the past. This would contradict the assumption that the capital ratio of the previous quarter is exogenous. Consequently, the actual effect of the capital ratio on lending rates might be systematically higher or lower than the effect identified here. It should also be borne in mind that the analysis outlined in this box does not capture any spillover effects between banks. Such spillover effects could mean that, on aggregate, a change in the capital ratios has a different effect than the results presented here suggest.

- Expansionary monetary policy weighs on banks' profitability and thus their capital endowment and ...
- ... the erosion of the capital endowment causes banks to reduce their lending.

The level of the reversal rate is neither directly observable nor fixed; it is time-varying and depends, in particular, on the size of the excess capital buffer. The smaller the excess capital buffer, the more likely it is that a reduced capital endowment will have a dampening effect on lending. The reversal rate thus materialises earlier when banks have a smaller excess capital buffer than when it is large. In other words, as the excess capital buffer falls, the reversal rate rises. Consequently, all factors that change the excess capital buffer also change the level of the reversal rate. These factors include not only the duration of the low interest rate period but also, for example, changed capital requirements and the business cycle.

In a cyclical downturn, credit risk typically increases. If this heightened risk translates into higher risk weights, this triggers a rise in risk-weighted assets.³⁵ Ceteris paribus, this reduces banks' capital ratio and thus also their excess capital buffer. Tighter regulatory capital requirements likewise lower the excess capital buffer, all other things being equal. In addition, the net interest margin decreases the longer the low interest rate period lasts.³⁶ Taken in isolation, the resulting downward pressure on bank profitability is likely to raise the reversal rate over time.

However, margin compression can also have an expansionary effect on lending as long as the reversal rate has not yet materialised. This is indicated by the results of the euro area Bank

Reversal rate rises with falling excess capital buffer, among other factors

BLS results do not indicate that reversal rate has materialised in the euro area

³⁵ Furthermore, credit defaults place a direct strain on capital and thus, ceteris paribus, reduce the excess capital buffer.

³⁶ See Altavilla et al. (2018), Borio et al. (2017), Claessens et al. (2018) and Klein (2020).

Lending Survey (BLS) (see the adjacent chart). The participating banks responded to the downward pressure on their profitability from the negative deposit facility rate by expanding their lending, probably in an attempt to compensate for margin compression. The BLS results suggest that, despite the downward pressure on their margins, the participating euro area banks had sufficient scope in their capital endowment to expand their lending. The BLS thus gives no indication that a reversal rate has already materialised in the euro area.³⁷

Taken in isolation, capital endowment developments during the pandemic have not increased the likelihood of a reversal rate scenario in the euro area

The outbreak of the coronavirus pandemic led to concerns that pandemic mitigation measures would trigger a sharp increase in credit defaults in the hardest hit sectors. Banks would then have needed to increase their loan loss provisioning, resulting in downward pressure on their profitability and thus their capital endowment. This deterioration in banks' capital endowment would, ceteris paribus, have increased the likelihood of a reversal rate scenario in the euro area as it would have reduced the excess capital buffer in the banking system given the existing regulatory capital requirements. No such scenario materialised, however, partly because the regulatory capital requirements were temporarily loosened and fiscal policy support measures alleviated the impact of the pandemic.³⁸ In addition, supervisors asked banks to temporarily refrain from or limit dividends.³⁹ In reality, euro area banks' capital ratios have actually risen since the outbreak of the pandemic.⁴⁰ Excess capital buffers have also tended to increase in the quarters since the pandemic began.⁴¹ To date, developments in the capital endowment do not indicate, in and of themselves, that a reversal rate scenario in the euro area has become more likely during the pandemic.

Implications for monetary policy

The indicators addressed in this article suggest that a reversal rate for the aggregated banking

system has not yet materialised either in Germany or the euro area. The econometric analysis presented here does not give any indication that the German banking system is currently likely to experience lending constraints due to a decline in capital ratios. For the euro area, the BLS results show that, so far, banks have responded to the downward pressure on their margins due to the negative deposit facility rate by expanding their lending, not by restricting it. Furthermore, the capital endowment of euro area banks has improved since the outbreak of the coronavirus pandemic, which, ceteris paribus, has made a reversal rate scenario less likely.

Indicators suggest that the reversal rate has not materialised so far in the euro area as a whole

³⁷ This assessment is consistent with the results of Rostagno et al. (2019) and Darracq Pariès et al. (2020).

Reversal rate cannot be quantified for the current end ...

The reversal rate probably has not yet materialised in the euro area. However, it is impossible to tell how far the banking system is from the reversal rate at present because its level at the current end cannot be determined precisely enough. The level of the reversal rate changes all the time because the macroeconomic and/or regulatory environment also change. As a result, the analyses and indicators presented in this article do not allow the reversal rate to be quantified at the current end.

Nonetheless, the article illustrates which metrics can be helpful in assessing the potential

risk of hitting the reversal rate at the current end. One key metric is banks' excess capital buffer: its size is a crucial factor in banks' lending and thus also in the probability of a monetary policy measure triggering a reversal rate scenario. The concept of the reversal rate is therefore useful in monetary policy discussions as it shows which mechanisms can potentially lessen the impact of monetary policy in a period of low interest rates. It thus provides valuable insights into the indicators and factors that warrant closer attention from monetary policymakers in a low interest rate environment.

... but concept still useful in monetary policy discussions

■ German balance of payments in 2021

In 2021, the German economy's current account surplus increased by ½ percentage point to 7½% of nominal gross domestic product (GDP). The surplus more or less returned to its pre-pandemic level, following its short-lived decline in the previous year. It was chiefly the primary income surplus that grew in size, while the balances of the goods account, services account and secondary income remained largely unchanged. This outcome is only partly attributable to the reversal of developments observed in the first year of the pandemic. The primary income surplus recovered owing to a higher level of income from Germany's outward foreign direct investment amid the upswing in most host countries, and German exporters benefited from a rebound in foreign demand. However, strong increases in import prices in connection with pandemic-related supply bottlenecks reduced the surplus in the goods account. In addition, Germans' continued low spending on travel together with exceptionally high receipts from patents for vaccines in 2021 had a positive impact on Germany's services account, which usually runs a deficit.

From a saving and investment perspective, the rise in the current account surplus was attributable mainly to increased saving, which exceeded the cyclical recovery in investment. Saving by non-financial corporations went up, which may, to some extent, have been for precautionary and deleveraging purposes after the crisis-related strains of the year before. While household saving was down, it remained significantly above its pre-crisis level. Given the presence of temporary, persistently large crisis-related burdens, the general government deficit remained broadly unchanged.

The ongoing coronavirus pandemic affected not only the current account but also international capital flows in 2021. In particular, expansionary fiscal and monetary policy responses to the pandemic in many countries affected cross-border activities. At the same time, inflation rates and expectations rose in many places over the course of the year. As a result, a number of major central banks returned to a slightly more restrictive monetary policy. For example, the US Fed began tapering its net asset purchases in November and the Bank of England raised its Bank Rate. Other central banks such as the European Central Bank (ECB), the Bank of Canada and the Bank of Japan announced that they were considering either scaling back or fully discontinuing their asset purchase programmes. All in all, at €314½ billion in 2021, Germany's net capital exports were substantially higher than in the year before (€216½ billion).

Portfolio investment, financial derivatives and direct investment saw net capital exports. By contrast, other investment predominantly gave rise to capital inflows, with the Bundesbank's external claims from a higher TARGET2 balance rising less strongly than its external liabilities. Besides larger deposits from non-resident counterparties and the above average issuance of euro banknotes, a one-off effect stemming from the allocation of special drawing rights by the International Monetary Fund (IMF) had an impact here. In turn, the allocation of special drawing rights caused the Bundesbank's reserve assets to grow.

■ Current account

Underlying trends in the current account

Current account surplus up significantly on annual average

In a year-on-year comparison, Germany's current account surplus rose by €26½ billion in 2021 to €265½ billion. The balance increased by ½ percentage point to 7½% of nominal GDP. However, Germany's current account surplus shrank over the course of the year. The country's current account surplus amounted to 8¼% of GDP in the first quarter, decreasing as the year progressed to a seasonally adjusted 5½% in the final quarter.

The change in the current account balance was brought about by contrasting developments in certain sub-accounts. The main driver of growth in the aggregate was the significant rise in the primary income balance, due especially to the higher level of income from Germany's outward foreign direct investment amid the economic recovery in most host countries, the pace of which exceeded that in Germany.¹ The surplus in the goods account went up marginally. Relative to GDP, however, it went down slightly. While the economic recovery of Germany's trading partners raised the surplus in the reporting year by way of volume effects, these effects were outweighed by the impact of strong import price increases in connection with pandemic-related supply bottlenecks. The deterioration in German terms of trade over the course of the year was amplified by the rise in energy prices, in particular. In addition, supply-side production constraints in Germany gradually grew larger. On balance, the surplus in the goods account, and with it the current account surplus, shrank over the course of the year. Furthermore, travel started to normalise somewhat around mid-2021, which tended to reduce the surplus in the services account. On average in 2021, the larger receipts in the services account from charges for the use of intellectual property to develop vaccines offset higher deficits in other sub-items, such as cross-border travel. The deficit in the secondary income account remained broadly unchanged.

Higher primary income main reason for growth; increased import prices curbed surplus over course of year

The global economic recovery shaped the global setting in 2021. First, German exporters benefited from increased foreign demand. According to data from the Centraal Planbureau's

¹ Another reason for the stronger increase in the value on the revenue side is the higher starting level for revenue compared with expenditure, which is the result of Germany's larger outward foreign direct investment stock compared with its inward foreign direct investment stock. The direct investment income figures for 2021 compared with 2020 were estimated on the basis of growth factors of other OECD countries' direct investment income based on information from the OECD International Direct Investment Statistics. Final figures are not available until two years after the reports they are based on have been received and checked – currently, these figures are available for the years up to and including 2018.

Global mixture of favourable demand conditions, shortages and price increases for intermediate goods and energy

(CPB) World Trade Monitor, world trade increased very significantly across regions. Economic output in a number of countries, including the United States and China, returned to or exceeded pre-crisis levels. Other economies, including those in the euro area, were still lagging behind in terms of economic activity due to divergent pandemic developments and measures taken to combat them. Second, the global boost in demand led to delivery delays and shortages of important intermediate goods in light of the pandemic-related production and transport problems. This led to steep increases in the prices of inputs and industrial raw materials. The prices of fossil fuels also rose, in some cases drastically, in view of high demand and scarce supply. At just under US\$71, a barrel of Brent crude oil cost around two-thirds more in 2021 than in the year before. According to the Hamburg Institute of International Economics, natural gas and coal prices have tripled and doubled, respectively.² German exporters also faced slight headwinds stirred up by the appreciation of the euro. The currency's nominal effective exchange rate against the currencies of the euro area's 42 most important trading partners, on average across 2021, was roughly 1¼% higher than the previous year's level.

Surplus position vis-à-vis euro area countries increased

From a regional perspective, the current account surplus vis-à-vis euro area countries rose to 3% of GDP, with increases in the balances of the goods account and primary income exceeding the larger deficit in the services account. The current account surplus vis-à-vis non-euro area countries remained unchanged, at 4½% of GDP. Here, increases in the balances of primary income and the services account offset the decrease in the goods surplus.

Significant increases in investment activity and aggregate saving

Aggregate net lending/net borrowing rose slightly relative to GDP in the reporting year.³ Both domestic investment and domestic saving recovered significantly on aggregate, but did not completely rebound from the low levels of the previous year. Amongst other things, supply bottlenecks dampened backlog and catch-

Price and volume effects on the German foreign trade balance*

 Deutsche Bundesbank

up effects in business investment. Meanwhile, private residential investment increased sharply. While household saving was down, it remained significantly above its pre-crisis level due to certain opportunities to consume, such as trips abroad, being available only to a limited extent or not being taken up to the same extent as before the outbreak of the coronavirus pandemic. Given the presence of temporary, persistently large crisis-related burdens, the general government deficit remained broadly unchanged. However, saving by non-financial corporations increased very significantly, due in part to lower distributions. This may, to some extent, have been for precautionary and deleveraging purposes after the crisis-related strains

² Significant mark-ups were recorded for natural gas and coal compared with 2019, too. Prices went up by only one-tenth for crude oil, suggesting that developments in 2021 also reflect certain signs of recovery.

³ As in previous years, the statements in this report are based on revised balance of payments figures for the past four years. The net lending/net borrowing figures from the national accounts do not yet include these revisions.

Savings and investment in the German economy

As a percentage of GDP

¹ Including consumption of fixed capital.
 Deutsche Bundesbank

of the year before. On balance, the increase in net lending/net borrowing by non-financial corporations exceeded the decrease for households, while net lending/net borrowing by general government remained unchanged.

Goods flows and balance of trade

At 8% in price-adjusted terms, goods exports recorded very strong year-on-year growth in 2021. Imports of goods grew less strongly, by 3¼%. The fact that exports of certain capital goods such as machinery and motor vehicles

Foreign trade saw strong growth on annual average, ...

were significantly depressed in 2020 due to the pandemic was a contributing factor behind the relatively high percentage growth rate for exports. As a result, the volume of total exports in the reporting year was still slightly below the annual average for 2019, a level to which imports returned. In 2021, the year-on-year increase in exports and particularly imports was far higher in terms of value than in price-adjusted terms, at 14% and 17% respectively. On balance, the foreign trade balance fell by €7½ billion to €173 billion.

The recovery of Germany's foreign trade activities from their pandemic-related slump in 2020 slowed down over the course of 2021. The main reason for this was sluggish industrial activity in Germany and its trading partners for large parts of the reporting year; this activity was hampered by delivery delays and materials shortages in the second half of the year, in particular. In real terms, total exports in the fourth quarter were up by only 1½% on the year, and imports were down by 1¾%.

... but affected by supply bottlenecks over course of year

In regional terms, German exporters recorded very strong increases in sales to almost every partner country in the euro area. Deliveries to countries outside the euro area also saw strong growth. In this context, the increases in sales to central and eastern European countries as well as to the United States were especially pronounced. In addition, there was perceptible growth in exports to commodity-exporting countries such as Russia, Brazil and South Africa, which are also likely to have benefited from greater scope for expenditure as a result of income from their commodity sales. Sales to China likewise recorded a significant increase in line with the strong expansion of the Chinese economy. By contrast, exports to the United Kingdom declined markedly as the transitional period ensuring reciprocal market access under EU single market rules had come to an end.

Very strong increase in exports to euro area and sales regions outside the euro area

With regard to the range of exported goods, practically all areas saw very steep growth in price-adjusted terms in the year under review.

Very strong growth in exports of wide range of products

Exports of intermediate goods more than recovered from the decline recorded in the previous year. Among capital goods, there was a considerable increase in exports of motor vehicles and motor vehicle parts as well as of machinery and equipment. Exports of other transport equipment such as aircraft suffered from the global travel outlook, which remains subdued by the coronavirus pandemic, and declined further. Very strong growth was recorded by exports of electrical equipment, chemical products, computers, and electronic and optical products. Exports of consumer goods also made strong gains. This was bolstered by the very sharp hike in demand for pharmaceutical products; in this context, the global need for coronavirus vaccines made in Germany also played a major role.

Strong expansion in imports of wide range of goods, but motor vehicle imports more subdued

Imports of intermediate goods saw very steep growth. Among capital goods, there was an especially sharp rise in deliveries of machinery and equipment from foreign manufacturers. These benefited from an improvement in the pandemic situation leading to a reduction in uncertainty, which had also weighed on the investment plans of German enterprises. Meanwhile, imports of motor vehicles and motor vehicle parts suffered heavily from global supply bottlenecks and saw only moderate growth. Deliveries of consumer goods rose steeply, with imports of pharmaceutical products expanding especially strongly, which was linked to the need for coronavirus vaccines and tests.

Sharp expansion in deliveries from euro area and third countries

Broken down by region, deliveries from the euro area and from other countries saw similarly strong growth in price-adjusted terms, with manufacturers in almost every partner country recording growth in their sales to Germany. Among Germany's major trading partners in the euro area, imports from Belgium grew exceptionally strongly in terms of value, with coronavirus vaccines produced in that country also playing a significant role. Among third countries, key energy suppliers such as Russia and the OPEC countries saw very considerable revenue growth from sales to Germany,

which was partly due to inflation for energy products.

Slight increase in balance of trade in goods despite decline in foreign trade balance

The other components of trade in goods – which comprise the supplementary trade items, net goods exports in merchanting trade and trade in non-monetary gold – more than compensated for the decline in the foreign trade surplus overall. In net terms, the goods surplus rose by €2½ billion in 2021.⁴

Invisible current transactions

Massive rise in services sales; strong impact of one-off developments

In the cross-border trade in services, receipts and expenditure rose steeply in 2021, similarly to the goods trade, following the slump in the previous year. At 17½%, services exports grew to the same extent as services imports, which rose by 18½%. As a result, this account, which had posted large deficits in the past and recorded a slight surplus for the first time in many decades during the course of the pandemic, also posted a small surplus of €½ billion last year. However, this was only partially attributable to the recovery, i.e. a return to pre-pandemic conditions. One-off developments in certain sub-accounts had a major impact on the overall services account.

Before the outbreak of the coronavirus pandemic, German residents' traditionally high foreign travel expenditure was responsible for the large deficit in the services account. With gains of €6½ billion in the year under review, this item saw hardly any recovery following its coronavirus-related collapse of almost three-fifths – or nearly €50 billion – in the first year of the pandemic. Due to the pandemic situation and the associated obstacles to travel, long-distance journeys in particular, but also Alpine winter tourism, were even weaker in 2021 than they had been in the previous year. By contrast, expenditure for summer travel to Mediterranean countries rose again. In terms of travel income – which is dominated by travel for trade fairs, events and business trips – Germany has seen no recovery thus far. The deficit in the travel account, which has been shrinking strongly over the course of the pandemic so

Deficit in foreign travel account still much smaller than usual

⁴ On balance, the higher supplementary trade items were the key factor in this. Here, there was a very sharp rise in the c.i.f. charges for imports, amongst others; these comprise the costs of freight and insurance from the border of the supplier's country to the German border. Furthermore, net income from merchanting trade rose steeply by €6½ billion, as receipts from sales grew to a larger extent than expenditure for purchases. In this context, a key role was played by transactions in the automotive industry; a considerable share of merchanting transactions are generally attributable to this industry. This was contrasted by a rise of €7 billion in net expenditure for trade in non-monetary gold. Here, transaction values rose on the expenditure side and fell on the receipts side.

far, widened again by €7 billion on balance. However, at €22 billion, it remained well short of the considerable deficits to which Germany is accustomed.

Transport services see massive growth in sales with increased deficit

Cross-border transport services reflect goods-related economic activity in the services sector and, for Germany, are normally in deficit. Following the decline in both receipts and expenditure in this area resulting from the reduced trade in goods in 2020, both sides of the balance sheet were extended significantly beyond their pre-crisis levels during the year under review. However, this was only partially attributable to the renewed considerable rise in import and export volumes. Due to disrupted supply chains and higher energy prices, there was a massive increase in freight rates for international goods transport. Forwarding agents, shipping companies and air transport enterprises domiciled in Germany benefited from this, making gains of more than 41% over the previous year. However, domestic customers' expenditure with non-resident transport companies also grew, by 39%. As a result of this development, the deficit that had been accrued in this sub-account in the previous year widened only slightly by €2½ billion. Other components of the services account related to the goods trade, such as manufacturing, maintenance and repair services, experienced only marginal changes in their balances compared with 2020.

Significant one-off effect in income from charges for the use of intellectual property

The very steep rise in services receipts in 2021 was significantly bolstered by a one-off effect in charges for the use of intellectual property. In this item, expenditure rose by €3 billion, while receipts grew by just over €17 billion. Licence fees for vaccines played a major role in this context. As a result, the surplus grew massively in 2021 to €32 billion.

Other knowledge-based and business services recorded larger deficit

In the year under review, receipts and expenditure for other knowledge-based and business services saw somewhat below average growth. Here, the deficit for cross-border telecommunications and information services remained vir-

tually unchanged, while sales in both directions rose considerably. In the first year of the pandemic, there had only been a small dip in an otherwise very strong trend. There was limited recovery in receipts in the area of other business services from abroad. By contrast, expenditure for research and development, professional, technical and commercial services, as well as management consultancy services grew to a greater extent. In net terms, the deficit in this category widened by around €4 billion.

Expansion in financial services

In the year under review, domestic enterprises generated a slightly smaller surplus from cross-border financial services and insurance and

pension fund services than they had in 2020. The main reason for this was the steep rise in expenditure for financial services usually provided by banks, which exceeded the growth on the receipts side. Sales of these services had also increased in the previous year due to relocations away from the financial centre of London as a result of Brexit. By contrast, cross-border insurance and pension fund services only recorded marginal changes in sales and in the balance compared with the previous year.

Following a decline in 2020, the surplus on the primary income balance widened again considerably in the year under review. Germany's receipts from abroad exceeded payments to other countries by €126½ billion and were thus higher than they had been immediately prior to the pandemic. Combined, cross-border compensation of employees and other primary income were almost balanced, as in the preceding year. The dominant balance sheet item was investment income. In the second year of the pandemic, corporate earnings saw a strong recovery. Net receipts from cross-border investment rose by €29 billion compared with the first year of the pandemic, amounting to €126 billion according to preliminary calculations. In this context, receipts to resident investors and capital donors from foreign investments grew massively by more than one-sixth, reaching a total of €213 billion. This rise is largely attributable to the upswing in receipts from direct investment, although this had also been preceded by a very sharp drop. By contrast, payments to foreign financiers saw hardly any growth, rising by ½%, and thus remained far short of the pre-crisis level. This was partly due to the fact that the rise in payments from residents to non-resident capital donors for their direct investment was somewhat counterbalanced by a corresponding decline in expenditure for portfolio investment.

Surplus in investment income grows to outstrip pre-crisis level

Much like in the year before, the deficit in the cross-border secondary income account widened slightly last year by €1½ billion to €54 billion. For Germany, unilateral payments grew

Deficit in secondary income account widened somewhat

considerably on both the receipts and expenditure side. Government payment flows were the major factor in this. Germany's contributions to the EU budget based on gross national income rose significantly in 2021. In the opposite direction, inflows to Germany included coronavirus-related special assistance from the EU budget, amongst others. Receipts from income and wealth taxes on persons resident abroad also increased slightly once again.

■ Capital movements

Underlying trends in capital movements

Germany's net capital exports again higher than in previous year

In 2021, Germany's current account surplus was mirrored by net capital exports of €314½ billion.⁵ Following the sharp economic downturn in 2020, enterprises and financial players started 2021 with confidence and hopeful for a rapid upswing, with vaccination campaigns being launched in some advanced economies at the end of 2020 and the beginning of 2021. The ongoing fiscal support and the strongly expansionary monetary policy also stimulated investors' risk appetite.

Financial markets influenced by risks: coronavirus pandemic and inflation concerns

However, the spread of new virus variants showed that the coronavirus pandemic was still far from over. Furthermore, in the second half of the year, unexpectedly high inflation rates and emerging inflation concerns increasingly proved to be a strain. Some central banks reacted by ushering in or at least signalling a tighter monetary policy stance: for example, the Fed in the United States tapered its asset purchases as of November, and the Bank of England increased its base rate (Bank Rate). The Eurosystem announced a marked reduction in the total envelope of its purchase programmes: the net purchases under the pandemic emergency purchase programme (PEPP) will be discontinued at the end of March 2022. Furthermore, in the first quarter of 2022, the Governing Council of the ECB expects to conduct net purchases under the PEPP at a lower pace than

in the previous quarter. At the same time, it decided to temporarily step up purchases under the expanded asset purchase programme (APP) to a limited extent. This deteriorating economic environment was compounded by mounting political risks relating to the Russia-Ukraine conflict that had already begun to escalate in 2021.

Although underlying conditions were challenging at times, German stakeholders benefited from Germany's integration in the global economy in 2021 as well. Cross-border ties are a key component in the economic growth of domestic firms.⁶ Unhindered access to international financial markets opens up additional funding opportunities for enterprises seeking capital and allows investors to diversify their asset investments. The free movement of capital facili-

⁵ The difference between the current account and financial account balances is primarily attributable to statistical errors and omissions (€51 billion).

tates cross-border investment, whereas foreign capital controls may have a dampening effect on financial flows to and from Germany (see the box on pp. 47 ff.).

Overall, the cross-border transactions of domestic market participants resulted in net cap-

ital exports in portfolio investment, financial derivatives and direct investment. Once again, the Eurosystem's purchase programmes had a profound impact on portfolio transactions. As the Bundesbank largely acquired domestic debt securities under its asset purchases, residents partly shifted their portfolios towards foreign, often higher-yielding assets. Non-residents, too, disposed of German paper on balance. Other investment recorded net capital imports. While German TARGET2 claims reached an all-time high at the end of 2021, the liabilities of the Bundesbank and the rest of the banking system to non-euro area residents rose even more strongly than the Bundesbank's claims on the ECB.

Germany's portfolio transactions shaped by Eurosystem purchase programmes

Portfolio investment

In 2021, there were net capital exports of €255 billion in portfolio investment, which was much higher than the €43 billion recorded in 2020. The main cause of these high outflows was the fact that domestic investors boosted their portfolios of foreign interest-bearing securities and foreign equities significantly, by €221½ billion. For instance, they showed considerable interest in foreign mutual fund shares (€103½ billion), and there was also strong demand for foreign shares (€56 billion).

Domestic investors acquired foreign mutual fund shares and equities ...

One reason for German investors' elevated foreign investment may lie in the search for yield associated with an increased appetite for risk: the stock markets in the United States, and even in other EU countries, for example, outperformed those in Germany. Accordingly, shares issued by firms in the US topped the list of purchases by German investors by a wide margin, at €26 billion. Furthermore, domestic investors added large volumes of equities from the Netherlands, the United Kingdom, Italy and Japan to their portfolios. Among the countries issuing mutual fund shares, Luxembourg and Ireland – two countries that are home to many investment companies – stood out.

... focusing on shares issued by US corporations

Impact of foreign capital controls on German financial flows*

In recent years, numerous countries have made greater use of capital controls in order to shield themselves from undesirable external disturbances or prevent outflows due to internal imbalances. The administrative design of these interventions has varied considerably in the specifics, depending on the motive. International organisations such as the International Monetary Fund (IMF) and the Organisation for Economic Co-operation and Development (OECD) have engaged in in-depth discussions of the circumstances under which interventions in financial flows can be justified.¹

There is no consensus on the impact of capital controls in the academic literature. Klein (2012) argues that temporary capital controls have no marked effect on the growth of financial variables, on the real exchange rate or on growth in gross domestic product (GDP). By contrast, Erten and Ocampo (2016) conclude that capital controls can help to reduce macroeconomic instabilities, therefore lending themselves to use as countercyclical policy instruments. In their literature review, Erten, Korinek and Ocampo (2021) show that different methods for measuring financial flows are a key reason why empirical studies arrive at differing results.

A large number of studies have so far focused on emerging market economies. This analysis looks at whether foreign capital controls reduce cross-border financial transactions between Germany and its partner countries. It explicitly does not set out to assess whether or not the measures implemented were effective. The study uses declarations from the German balance of payments statistics for the period from January 1999 to December 2017. The transactions

are available at a monthly frequency, but for most parts of the analysis they are aggregated to annual values because the measures for capital controls only vary over the years. The data permit a much more detailed analysis than studies using macro-data, which have so far dominated the relevant literature.

The balance of payments data are augmented by information on capital controls. To this end, this analysis uses the database of Fernández et al. (2016). The authors generate binary variables of the IMF's Annual Report on Exchange Arrangements and Exchange Restrictions (AREAER) for a total of 99 countries to form aggregate indices. In doing so, they concentrate on the AREAER's capital account category and thus on direct effects on financial flows. This approach resembles that of Chinn and Ito (2008),² but unlike them, Fernández et al. (2016) define separate measures for inflows and outflows, broken down into ten different asset categories.

The first question addressed is whether capital controls in general reduce Germany's cross-border financial flows. To this end, the empirical study uses a panel setting with multiple fixed effects:

* This analysis is based on a research paper by Goldbach and Nitsch (2020).

¹ See IMF (2012) and OECD (2015).

² The measure applied by Chinn and Ito (2008) is used very frequently in the empirical literature. However, the measure only provides indications for total financial flows and thus is not broken down into inflows and outflows or into different asset categories. Furthermore, the measure is based on a broader approach: all four of the overarching AREAER categories (FX Regime, Export Proceeds, Capital Account and Current Account) are used. This index therefore also takes into account indirect effects on financial flows which are attributable to export restrictions, for example.

Effect of foreign capital controls on Germany's cross-border financial flows^o

$$\begin{aligned} \text{Log}(\text{financial flows})_{dact} &= \alpha \\ &+ \beta \text{capital controls}_{ct-1} \\ &+ \{\gamma \text{control variable}_{ct-1}\} + \pi_{dac} + \sigma_t + \varepsilon_{dact} \end{aligned}$$

where $\text{financial flows}_{dact}$ is a measure for German financial flows (outflows from Germany, inflows to Germany, sum of outflows and inflows) of declarant d in asset category a with country c in year t ; $\text{capital controls}_{ct-1}$ is the (aggregate) measure of time-lagged capital controls from Fernandez et al. (2016) for country c in the previous year $t-1$; $\text{control variable}_{ct-1}$ is a vector with additional control variables; π_{dac} stands for combined fixed effects (declarant-asset-partner country), while σ_t represents time-specific fixed effects. Using the time-lagged variables serves as a way of taking into account, at least in part, possible endogeneity problems owing to reverse causality. Other control variables for cross-border financial flows are real GDP per capita, stock market capitalisation, real GDP growth and the government debt-to-GDP ratio.

The above table illustrates the estimation results for three different indices. The control variables are excluded in the baseline specification (columns 1 to 3); for comparison, the estimation results including control variables are shown in columns 4 to 6. This table indicates that both the aggregate index and the separate indices for controls on inflows and outflows have a significantly negative effect on Germany's bilateral financial flows. The results of the baseline specification and of the version with control variables are very similar. The control variables themselves have a significant effect on financial flows in some cases. How financial flows react to capital controls can depend on whether these controls are implemented on a temporary or long-term basis. Robustness checks suggest that temporary capital controls tend to have no ef-

³ The values of the variable "capital controls" vary between zero and one. The higher the value, the more capital controls are in place which affect cross-border financial flows. If a country introduces restrictions, fewer bilateral financial flows between Germany and that country are expected.

fect. The negative impact on cross-border financial flows is thus attributable to strict and long-term capital controls.

The microdata can be used to examine further mechanisms. For example, the effect of capital controls on market entries (“extensive margin”) and on the change in existing business relationships (“intensive margin”) can be assessed independently of one another. To do so, total German financial flows with a given partner country are decomposed into multiple elements, such as the number of declarants or the average volume of an ongoing entry (at the declarant-asset-month level).

The above table presents the estimation results. As before, the β coefficient is negative. Capital controls thus appear to have an effect on both the extensive (number) and intensive (average value) margin of bilateral financial relationships. However, roughly half of the coefficients are statistically insignificant. The strongest effect occurs for inflows to Germany. Other control variables generally do not affect the results.

In a final step, the effects of temporary capital controls within the European Union are studied. Starting in spring 2010, market participants increasingly began to have doubts about the solvency of the Greek government. This mounting nervousness was also felt by Cyprus, which had close

Deutsche Bundesbank

economic and financial ties to Greece. Concerned about the stability of its domestic banking sector, Cyprus implemented capital controls in March 2013, which remained in place until April 2015. The measures included a restriction on transferring money abroad. Greece imposed capital controls itself in June 2015, which were lifted in stages up until September 2019.

The previous approach is modified as follows: the study uses monthly data and constructs a balanced panel for European Union countries. A binary variable takes the value of one for Greece and Cyprus if capital controls are implemented in the respective country at the time. Control variables are the real effective exchange rate, inflation, reserve assets, long-term government bond yields and the stock market return.

The above table illustrates the estimation results. The previous results are confirmed.

Capital controls within the European Union also reduce Germany's cross-border financial flows. Since the capital controls were introduced in Greece and Cyprus during turbulent times, the control variables serve as further important factors. The estimated effect even becomes stronger as soon as these variables are taken into account in the regressions.

The aim of this study was to examine whether foreign capital controls reduce Germany's bilateral financial flows. The results support this thesis. Long-term measures, in particular, explain this relationship. In addition, capital controls introduced abroad reduce market entries by domestic players – which is to say, the establishment of financial relationships with foreign participants – (or lead to market exits) as well as transactions in existing business relationships. It was also demonstrated that capital controls within the European Union have this effect as well.

Also demand for euro-denominated foreign bonds ...

Foreign bonds were likewise in demand (€68½ billion). Compared with the previous year, however, investors shifted their focus from foreign currency bonds to instruments denominated in euro – despite the appreciation of other key currencies against the euro. These euro-denominated instruments made up over two-thirds of German net purchases. Among the public sector bonds denominated in euro, Italian government debt securities were particularly sought after, followed by instruments issued by Austria or the European Union. The latter instruments included the EU’s new issues to fund the European unemployment insurance programme (Support to mitigate Unemployment Risks in an Emergency – SURE) and the European Recovery and Resilience Facility (NextGenerationEU – NGEU).

function merely as a hub for international transactions and German institutions, too, have primarily repatriated their trading activities.

In 2021, foreign investors sold securities issued in Germany to the tune of €33½ billion on balance. In 2020, they had still been adding large volumes of domestic paper to their portfolios (€149 billion). The acquisition of structured debt securities from German issuers had played a major role at the time.⁷ This effect was much less significant in the year under review.

Net sales of German securities by non-residents ...

On the whole, foreign investors scaled back their holdings of German long-term debt securities in particular (€52 billion), with their sales of public sector bonds alone amounting to €75½ billion net. The Bundesbank’s purchases under the APP and the PEPP had an impact in this regard. By contrast, non-resident investors added private bonds issued in Germany to their portfolios on balance (€23 billion), stocking up on corporate bonds and divesting themselves of bank bonds. They also parted with German shares (€3½ billion) and mutual fund shares (€3 billion).

... explainable by asset purchase programmes

... and foreign currency bonds

German investors’ purchases of foreign currency bonds (€23½ billion) were spread across multiple countries, with issuance from the United States and the United Kingdom being the most significant. By contrast, domestic investors offloaded money market instruments issued abroad on balance (€6½ billion).

Withdrawal of United Kingdom from EU reflected in gross figures

The United Kingdom’s withdrawal from the EU left its mark on German portfolio investment in 2021 as well. The country finally left the European single market at the start of the year. The free trade agreement between the United Kingdom and the EU largely excludes financial services. In order to retain access to European financial markets, banks with an international focus have moved parts of their business out of the United Kingdom over the last few years to existing or newly established subsidiaries in Germany and other EU countries. This primarily relates to investment banking. This led, in particular, to a strong rise in the purchases and sales of foreign securities by financial institutions located here. Thus, transaction volumes virtually doubled from 2020 to 2021. That said, this increase in gross flows was not reflected in the aforementioned net portfolio investment figures for Germany, as the German branches of international commercial banks frequently

This development is consistent with the picture that German equity indices have underperformed against the indices of other advanced economies and that the euro has depreciated against key currencies. However, non-residents parked more liquidity in domestic money market instruments (€25 billion), of which around two-fifths were the structured securities mentioned earlier. The fact that the Federal government issued a large volume of short-dated bonds also became noticeable in the first quarter.

Financial derivatives (which are aggregated to form a single item in the balance of payments) recorded net capital exports of €61 billion in

⁷ In turn, the German affiliates involved purchased external assets in the form of economically equivalent derivatives or fixed-term deposits within their financial group, and they are recorded under financial derivatives or other investment. See Deutsche Bundesbank (2021b).

Deutsche Bundesbank

2021, a clear decline from the year before (€96½ billion). The main reason behind this decrease was fewer compensatory intra-group transactions in the form of over-the-counter options for the aforementioned transactions in structured debt securities. Nevertheless, they still account for just under half of the total balance of derivatives. On balance, a small volume of funds was invested in options and forward contracts. Cross-border forward and futures contracts relating to electricity and gas recorded net capital imports, whereas they had still registered net capital exports in 2020.

Intra-group transactions still dominate net capital exports of financial derivatives

Direct investment

Despite the persistently challenging environment caused by the coronavirus pandemic, global direct investment flows rebounded in 2021 after having declined considerably in 2020. The United Nations Conference on Trade and Development estimates that global direct investment flows rose by 77% on the year in 2021 and were thus higher than before the outbreak of the pandemic.⁸ The observed recovery varied considerably not only across regions but also across different sectors and types of cross-border direct investment. For example, greenfield investment activity remained much lower on average across all industrial sectors than prior to the pandemic. By contrast, there were higher flows of cross-border funding for infrastructure in many economic sectors through project financing. Mergers and acquisitions also picked up significantly, especially in the services sector. All in all, direct investment flows to advanced economies rose much more strongly than those to developing countries. A higher number of cross-border mergers and acquisitions were also carried out in advanced economies than in other countries.

Global direct investment flows up significantly again in 2021

German enterprises were no exception in this regard. Compared with the preceding year,

⁸ See United Nations Conference on Trade and Development (2022).

Substantial net capital exports due to German investment abroad

they stepped up their cross-border exposures considerably in 2021 through direct investment. Conversely, non-resident enterprises likewise boosted their direct investment in Germany, albeit to a lesser extent than in 2020. Overall, the second year of the pandemic presented German enterprises with an international focus with major challenges, however.⁹ In addition to the adverse effects of the coronavirus pandemic, geopolitical tensions also caused difficulties for enterprises operating abroad. Moreover, as mentioned earlier, the United Kingdom finally exited the European single market on 1 January 2021, resulting in a new playing field for cross-border investment. Business activities had already been relocated – to Germany in some cases – in the run-up to the UK’s withdrawal.

Looking at direct investment by German investors, 2021 saw, on balance, net capital exports of €102 billion – a record high when considered over the long term. This was in contrast to 2020, which had seen modest net capital imports.

German enterprises again expanded their equity investments ...

German enterprises invested €163½ billion abroad in 2021, around €44 billion more than in 2020. Once again, they strongly expanded their equity investments in foreign affiliates in particular (€113 billion). Similarly sized portions of these funds were for equity capital in the narrower sense and reinvested earnings. Comparatively high cross-border transaction values were recorded for enterprises specialised in providing professional and technical services.¹⁰ Last year, too, cross-border corporate takeovers by enterprises domiciled in Germany played a significant role in terms of volume.¹¹

... but also made much more credit available to affiliated enterprises

Enterprises domiciled in Germany issued €50½ billion in intra-group credit to foreign affiliated enterprises in 2021, significantly more than in 2020 (€29½ billion), predominantly in the form of loans. These loans were issued to subsidiaries and affiliates abroad. Subsidiaries domiciled in Germany also made large amounts of funds available to their foreign parent enterprises.

German enterprises engage in direct investment in many countries all over the globe. In 2021 alone, they made investments in over 60 countries. A large part (around 75%) of those

Europe and the United States key destinations for German direct investment

⁹ See Association of German Chambers of Industry and Commerce (2021a, 2021b).

¹⁰ The data refer only to decipherable net transfers used to augment equity capital.

¹¹ According to Refinitiv (Thomson ONE) data, in 2021 roughly €50½ billion was used to finance takeovers of companies domiciled abroad and previously under foreign ownership where the German stake after the transaction is at least 10%. This was somewhat less than in 2020, when the takeover value was given as €58½ billion. The time at which mergers and acquisitions are captured in the balance of payments can, however, differ from that recorded by Refinitiv, meaning that the reported figures are not directly comparable.

investments in 2021 were in partner countries in Europe. Just over a third of all German direct investment was thus made in other euro area countries. Within the euro area, particularly large amounts flowed into Luxembourg and the Netherlands, both significant holding company locations. Outside the euro area but still within Europe, comparatively high amounts were made available to affiliated enterprises in Switzerland and the United Kingdom. Outside Europe, the United States was the recipient of considerable German investment.

Inflows of capital from abroad via equity investment and intra-group lending

Foreign enterprises provided domestic enterprises with direct investment funds totalling €62 billion in 2021. This was about half the amount of funds provided to affiliated enterprises in 2020 in net terms, a year in which the inflow of capital was fairly large even in comparison to previous years. Foreign firms boosted the equity capital they provided to German branches by €37 billion. Moreover, they also made €25 billion in loans available to affiliated enterprises domiciled in Germany, largely via trade credits.

Considerable investment from the UK and euro area countries

Direct investment by firms from the United Kingdom was especially high (€23 billion). This was dominated by intra-group lending, which has been noticeably gaining importance over the last few years, not least because of relocation of business activities to Germany. Enterprises in Germany received a combined €35½ billion from euro area countries in 2021. The majority of these funds were also distributed via intra-group lending.

Other investment

Net capital imports in other investment

Other investment, comprising loans and trade credits (where these do not constitute direct investment) as well as bank deposits and other assets, saw net capital imports of €135 billion in 2021. In 2020, other investment gave rise to net capital exports of €81 billion. The balance of other investment often sees high volatility

– including changes in sign – but the reversal of trend in 2021 was particularly large.

This was largely due to considerable net inflows reported via the banking system. The Bundesbank's liabilities to non-residents arising from currency and deposits increased by €196 billion in 2021. For the most part, the increase in foreign liabilities was driven by a rise in deposits of non-euro area residents at the Bundesbank. This includes the balances of foreign central banks, monetary authorities, international organisations and commercial banks. These deposits often show a clear temporary rise at the end of a given year – as was the case in 2021.¹² The Bundesbank's liabilities arising from the allocation of euro banknotes within the Eurosystem went up by €36½ billion last year. Above and beyond that, the counterpart of special drawing rights allocated by the IMF recorded as a liability also rose strongly (see the reserve assets section on pp. 55 f. for further information).

Bundesbank accounts record net inflows

The Bundesbank's gross claims on non-residents also increased (by €123½ billion) in 2021. These primarily reflected the Bundesbank's higher TARGET2 claims on the ECB (€124½ billion). Their recent increase mirrored increased asset purchases as part of the APP and PEPP. The close relationship between the development of the Bundesbank's TARGET2 claims and asset purchases by Eurosystem central banks had already been observed in previous years.¹³ In 2021, the corresponding rise in German TARGET2 claims was, however, comparatively small. This was down to the countervailing effects of the financing and outpayment flows resulting from the European support programmes NGEU and SURE.¹⁴ On balance, the transaction-related increase in liabilities was €103½ billion larger than the increase in the Bundesbank's claims on non-residents in 2021.

TARGET2 claims rose less strongly than the effects of the asset purchase programmes suggested

¹² In January 2022, non-euro area residents reduced their deposits parked at the Bundesbank significantly again.

¹³ See Deutsche Bundesbank (2020, 2019, 2017a, 2017b, 2016).

¹⁴ See Drott et al. (2022).

Other MFIs also recorded net capital imports

Transactions via the accounts of other monetary financial institutions (MFIs) also saw net inflows of capital into Germany in 2021. These amounted to €46½ billion net. This was primarily down to higher deposits by foreign institutions, particularly group-affiliated banks. Additionally, deposits by foreign enterprises and households with domestic MFIs also rose on a smaller scale. In lending business, MFIs domiciled in Germany (excluding the Bundesbank) increased their deposits with foreign institutions. Above and beyond that, they issued more funds to foreign borrowers. On balance, their loan claims on foreign banks rose, primarily vis-à-vis group-affiliated banks, more strongly than their claims on enterprises or households abroad.

Net capital exports via non-banks' transactions

Other investment by non-banks led to net outflows of funds abroad. At €15 billion, net capital exports in 2021 were nevertheless much lower than in 2020 (€61½ billion). In this context, enterprises' and households' transactions produced net capital exports of €18½ billion. They issued loans to foreign business partners and again increased their deposits at foreign commercial banks. As with financial derivatives, this reflected (to an extent) counterpart entries to their transactions involving structured securities issued in Germany. Unlike in 2020, their liabilities to non-residents also rose steeply as they took out more loans – especially short-term loans – from overseas. By contrast, transactions by general government gave rise to net capital imports of around €4 billion.

Reserve assets

Reserve assets rose primarily due to large allocation of special drawing rights

The Bundesbank's reserve assets rose by €32 billion in 2021 on account of transactions. Of this, €31 billion was accounted for by its share of new special drawing rights allocated by the IMF,¹⁵ which, in August 2021, had decided upon and implemented a large allocation of special drawing rights to its member countries.¹⁶ Special drawing rights simultaneously constitute a liability and an asset on the Bun-

Deutsche Bundesbank

desbank's balance sheet. On the one hand, they are recognised as reserve assets in the Bundesbank's external position. On the other, an equal counterpart entry is made on the liabilities side as an adjustment item for special drawing rights. The allocated special drawing rights thus do not change a country's net external position and instead create a balance sheet extension.

The international reserve holdings are also influenced by balance sheet adjustments which,

¹⁵ See Deutsche Bundesbank (2022).

¹⁶ See International Monetary Fund (2021).

*Balance sheet
value increase

price effects*

in compliance with internationally agreed accounting standards, are not recognised in the balance of payments. The end-of-year revaluation of the reserve assets resulted in an increase of nearly €10½ billion in 2021. This was

due chiefly to rising gold prices. On the reporting date of 31 December 2021, the value of Germany's reserve assets stood at €261½ billion.

of paper issued by euro area MFIs. ⁹ Including national banknotes still in circulation. ¹⁰ The German contributions to the Eurosystem's monetary aggregates should on no account be interpreted as national monetary aggregates and are therefore not comparable with the erstwhile German money stocks M1, M2 or M3. ¹¹ The

difference between the volume of euro banknotes actually issued by the Bundesbank and the amount disclosed in accordance with the accounting regime chosen by the Eurosystem (see also footnote 2 on banknote circulation in Table III.2).

euro banknotes put into circulation by the Bundesbank in accordance with the accounting regime chosen by the Eurosystem (see also footnote 2 on banknote circulation in Table III.2). The volume of currency actually put into circulation by the

Bundesbank can be calculated by adding to this total the item "Intra-Eurosystem liability/claim related to banknote issue" (see "Other liability items"). ⁵ Excluding central governments' deposits. ⁶ In Germany, only savings deposits.

Discrepancies may arise from rounding. * The banking system's liquidity position is defined as the current account holdings in euro of euro area credit institutions with the Eurosystem. Amounts are derived from the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. ¹ Figures are daily averages for the reserve maintenance period ending in the month indicated. Following the changeover in the frequency of Governing Council monetary policy meetings to a six-week cycle, a reserve maintenance period no longer ends in every month. No figures

are available in such cases. ² Source: ECB. ³ Includes liquidity provided under the Eurosystem's asset purchase programmes. ⁴ From August 2009 includes liquidity absorbed as a result of the Eurosystem's foreign exchange swap operations. ⁵ From 2002 euro banknotes and other banknotes which have been issued by the national central banks of the Eurosystem and which are still in circulation. In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is

II. Overall monetary survey in the euro area

allocated to the ECB on a monthly basis. The counterpart of this adjustment is shown under "Other factors". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly basis, to the NCBS, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro banknotes allocated to an NCB and the value of the euro banknotes which that NCB has put into circulation is likewise shown under "Other factors". From 2003 euro

banknotes only. **6** Remaining items in the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. **7** Equal to the difference between the sum of liquidity-providing factors and the sum of liquidity-absorbing factors. **8** Calculated as the sum of the "Deposit facility", "Banknotes in circulation" and "Credit institutions' current account balances".

III. Consolidated financial statement of the Eurosystem

1. Assets *

€ billion

* The consolidated financial statement of the Eurosystem comprises the financial statement of the European Central Bank (ECB) and the financial statements of the national central banks of the euro area Member States (NCBs). The balance sheet items for foreign currency, securities, gold and financial instruments are valued at market

rates at the end of the quarter. ¹ In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is allocated to the ECB on a monthly basis. The counterpart of this adjustment is disclosed as an "Intra-Eurosystem liability related to

III. Consolidated financial statement of the Eurosystem

euro banknote issue". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly basis, to the NCBs, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro

banknotes allocated to the NCB according to the aforementioned accounting procedure and the value of euro banknotes put into circulation is also disclosed as an "Intra-Eurosystem claim/liability related to banknote issue". ² For the Deutsche Bundesbank: including DEM banknotes still in circulation. ³ Source: ECB.

* This table serves to supplement the "Overall monetary survey" in Section II. Unlike the other tables in Section IV, this table includes - in addition to the figures reported by

banks (including building and loan associations) - data from money market funds.
1 See footnote 1 in Table IV.2. 2 Excluding deposits of central governments.

IV. Banks

in other Member States 2				Deposits of central governments		Liabilities arising from repos with non-banks in the euro area	Money market fund shares issued 3	Debt securities issued 3		Liabilities to non-euro area residents	Capital and reserves	Other Liabilities 1	Period
With agreed maturities		At agreed notice		Total	of which: domestic central governments			Total	of which: with maturities of up to 2 years 3				
Total	of which: up to 2 years	Total	of which: up to 3 months

3 In Germany, debt securities with maturities of up to one year are classed as money market paper; up to the January 2002 Monthly Report they were published together

with money market fund shares. 4 Statistical breaks have been eliminated from the flow figures (see also footnote * in Table II.1).

IV. Banks

2. Principal assets and liabilities of banks (MFIs) in Germany, by category of banks *

€ billion

* Assets and liabilities of monetary financial institutions (MFIs) in Germany. The assets and liabilities of foreign branches, of money market funds (which are also classified as MFIs) and of the Bundesbank are not included. For the definitions of the respective items, see the footnotes to Table IV.3. **1** Owing to the Act Modernising Accounting Law (Gesetz zur Modernisierung des Bilanzrechts) of 25 May 2009, derivative financial instruments in the trading portfolio (trading portfolio derivatives) within the meaning of

Section 340e (3) sentence 1 of the German Commercial Code (Handelsgesetzbuch) read in conjunction with Section 35 (1) number 1a of the Credit Institution Accounting Regulation (Verordnung über die Rechnungslegung der Kreditinstitute) are classified under "Other assets and liabilities" as of the December 2010 reporting date. Trading portfolio derivatives are listed separately in the Statistical Series Banking statistics, in Tables I.1 to I.3. **2** For building and loan associations: including deposits under savings

¹ The reserve maintenance period starts on the settlement day of the main refinancing operation immediately following the meeting of the Governing Council of the ECB for which the discussion on the monetary policy stance is scheduled. ² Article 3 of the Regulation of the European Central Bank on the application of minimum reserves (excluding liabilities to which a reserve ratio of 0% applies, pursuant to Article 4(1)). ³ Amount after applying the reserve ratio to the reserve base. The reserve ratio for

liabilities with agreed maturities of up to two years was 2% between 1 January 1999 and 17 January 2012. Since 18 January 2012, it has stood at 1%. ⁴ Article 5(2) of the Regulation of the European Central Bank on the application of minimum reserves. ⁵ Average credit balances of credit institutions at national central banks. ⁶ Average credit balances less required reserves after deduction of the lump-sum allowance. ⁷ Required reserves after deduction of the lump-sum allowance.

* The interest rate statistics gathered on a harmonised basis in the euro area from January 2003 are collected in Germany on a sample basis. The MFI interest rate statistics are based on the interest rates applied by MFIs and the related volumes of euro-denominated deposits and loans to households and non-financial corporations domiciled in the euro area. The household sector comprises individuals (including sole proprietors) and non-profit institutions serving households. Non-financial corporations include all enterprises other than insurance corporations, banks and other financial institutions. The most recent figures are in all cases to be regarded as provisional. Subsequent revisions appearing in the following Monthly Report are not specially marked. Further information on the MFI interest rate statistics can be found on the Bundesbank's website (Statistics/Money and capital markets/Interest rates and yields/Interest rates on deposits and loans). ° The statistics on outstanding amounts are collected at the end of the month. 1 The effective interest rates are calculated either as

annualised agreed interest rates or as narrowly defined effective rates. Both calculation methods cover all interest payments on deposits and loans but not any other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance. 2 Data based on monthly balance sheet statistics. 3 Secured and unsecured loans for home purchase, including building and home improvements; including loans granted by building and loan associations and interim credits as well as transmitted loans granted by the reporting agents in their own name and for their own account. 4 Loans for consumption are defined as loans granted for the purpose of personal use in the consumption of goods and services. 5 For the purpose of these statistics, other loans are loans granted for other purposes such as business, debt consolidation, education, etc. 6 Including overdrafts (see also footnotes 12 to 14 on p. 47).

For footnotes * and 1 to 6, see p. 44*. For footnote x see p. 47*. + For deposits with an agreed maturity and all loans excluding revolving loans and overdrafts, credit card debt: new business covers all new agreements between households or non-financial corporations and the bank. The interest rates are calculated as volume-weighted average rates of all new agreements concluded during the reporting month. For overnight deposits, deposits redeemable at notice, revolving loans and overdrafts, credit card debt: new business is collected in the same way as outstanding amounts for the sake of simplicity. This means that all outstanding deposit and lending business at

the end of the month has to be incorporated in the calculation of average rates of interest. 7 Estimated. The volume of new business is extrapolated to form the underlying total using a grossing-up procedure. 8 Including non-financial corporations' deposits; including fidelity and growth premiums. 9 Excluding overdrafts. 10 Annual percentage rate of charge, which contains other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance.

For footnotes * and 1 to 6, see p. 44*. For footnotes + and 7 to 10, see p. 45*;
11 For the purposes of the interest rate statistics, a loan is considered to be secured if collateral (amongst others financial collateral, real estate collateral, debt securities) in at least the same value as the loan amount has been posted, pledged or assigned.
12 Including revolving loans which have all the following features: (a) the borrower may use or withdraw the funds to a pre-approved credit limit without giving prior notice to the lender; (b) the amount of available credit can increase and decrease as funds are borrowed and repaid; (c) the loan may be used repeatedly; (d) there is no obligation of regular repayment of funds. **13** Overdrafts are defined as debit balances

on current accounts. They include all bank overdrafts regardless of whether they are within or beyond the limits agreed between customers and the bank. **14** Including convenience and extended credit card debt. Convenience credit is defined as the credit granted at an interest rate of 0% in the period between payment transactions effected with the card during one billing cycle and the date at which the debt balances from this specific billing cycle become due. **15** The amount category refers to the single loan transaction considered as new business. **x** Dominated by the business of one or two banks. Therefore, the value cannot be published due to confidentiality.

Sources: The calculations for the insurance sectors are based on supervisory data according to Solvency I and II and for pension funds on IORP supervisory data and own data collections as of 2020 Q1. Until 2019 Q4 these are compiled using Solvency I supervisory data, supplemented by voluntary reports and own calculations. ¹ Accounts receivable to monetary financial institutions, including registered bonds, borrowers' note loans and registered Pfandbriefe. For pension funds as of 2020 Q1 fair values, previously book values. ² Including deposits retained on assumed reinsurance as well as registered bonds, borrowers' note loans and registered Pfandbriefe. For pension funds

as of 2020 Q1 fair values, previously book values. ³ Including reinsurance recoverables and claims of pension funds on pension managers. ⁴ Valuation of listed securities at the corresponding consistent price from the ESCB's securities database. ⁵ Not including the reinsurance business conducted by primary insurers, which is included there. ⁶ The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included. ⁷ Change in data sources.

Sources: The calculations for the insurance sectors are based on supervisory data according to Solvency I and II and for pension funds on IORP supervisory data and own data collections as of 2020 Q1. Until 2019 Q4 these are compiled using Solvency I supervisory data, supplemented by voluntary reports and own calculations. ¹ Including deposits retained on ceded business as well as registered bonds, borrowers' note loans and registered Pfandbriefe. ² Including claims of pension funds on pension managers and entitlements to non-pension benefits. ³ Technical reserves "life" taking account of

transitional measures. Health insurance is also included in the "non-life insurance" sector. ⁴ Own funds correspond to the sum of "Net worth" and "Shares and other equity". ⁵ Not including the reinsurance business conducted by primary insurers, which is included there. ⁶ Valuation at book values. The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included. ⁷ Change in data sources.

1 Bearer debt securities with maximum maturities according to the terms of issue of over 4 years. Structured debt securities, debt securities with unscheduled redemption, zero coupon bonds, floating rate notes and bonds not denominated in Euro are not included. Group yields for the various categories of securities are weighted by the amounts outstanding of the debt securities included in the calculation. Monthly figures

are calculated on the basis of the yields on all the business days in a month. The annual figures are the unweighted means of the monthly figures. Adjustment of the scope of securities included on 1 May 2020. 2 End of year or month. 3 Source: Deutsche Börse AG. 4 Only debt securities eligible as underlying instruments for futures contracts; calculated as unweighted averages.

Source: Bundesbank calculations based on Federal Statistical Office data. ¹ Annual figures based on the calculations of the Federal Statistical Office. Bundesbank supplementary estimations for the reporting years after 2011 that are not yet available. The quarterly figures contain numerous off-budget entities which are assigned to the general government sector as defined in the national accounts but are not yet included in the annual calculations. From 2012 also including the bad bank FMSW. ² The annual figures do not tally with the sum of the quarterly figures, as the

latter are all provisional. The quarterly figures for some insurance sectors are estimated. ³ The development of the types of expenditure recorded here is influenced in part by statistical changeovers. ⁴ Including discrepancies in clearing transactions between central, state and local government. ⁵ On the revenue side, this contains proceeds booked as disposals of equity interests and as loan repayments. On the expenditure side, this contains the acquisition of equity interests and loans granted. ⁶ Including central government liquidity assistance to the Federal Employment Agency.

Sources: Federal Statistical Office; Federal Employment Agency. * Annual and quarterly figures: averages; calculated by the Bundesbank; deviations from the official figures are due to rounding. 1 Workplace concept; averages. 2 Monthly figures: end of month. 3 Number within a given month. 4 Mid-month level. 5 Relative to the total civilian labour force. 6 Excluding government-assisted forms of employment and seasonal jobs, including jobs located abroad. 7 From January 2017 persons receiving additional income assistance (unemployment benefit and unemployment benefit II at the same time) shall be assigned to the legal category of the Third Book of the Social Security

Code (SGB III). 8 Statistical break due to late recording of unemployed persons in the legal category of the Second Book of the Social Security Code (SGB II). 9 Initial preliminary estimate by the Federal Statistical Office. 10 Unadjusted figures estimated by the Federal Employment Agency. In 2019 and 2020, the estimated values for Germany deviated from the final data by a maximum of 0.1% for employees subject to social contributions, by a maximum of 0.9% for persons solely in jobs exempt from social contributions, and by a maximum of 55.3% for cyclically induced short-time work. 11 From May 2021, calculated on the basis of new labour force figures.

* Non-financial groups admitted to the Prime Standard segment of the Frankfurt Stock Exchange which publish IFRS consolidated financial statements on a quarterly or half-yearly basis and make a noteworthy contribution to value added in Germany. Excluding groups engaged in real estate activities. 1 Earnings before interest, taxes, depreciation and amortisation. 2 Quantile data are based on the groups' unweighted return on sales. 3 Annual figures do not always match the sum of the two half-year figures.

ures. See Quality report on consolidated financial statement statistics, p. 3. 4 Adjusted for substantial changes in the basis of consolidation of large groups and in the reporting sample. See the explanatory notes in Statistical Series Seasonally adjusted business statistics. 5 Including groups in agriculture and forestry. 6 From this point onwards: significant changes in IFRS standards, impairing comparability with previous periods.

* Assets and liabilities vis-à-vis all countries within and outside the euro area. Up to December 2000 the levels at the end of each quarter are shown, owing to revaluations, at market prices; within each quarter, however, the levels are computed on the basis of cumulative transaction values. From January 2001 all end-of-month levels are valued at market prices. **1** Mainly net claims on TARGET2 balances (acc. to the respective country designation), since November 2000 also balances with non-euro area central banks

within the ESCB. **2** Mainly long-term debt securities from issuers within the euro area. **3** Including estimates of currency in circulation abroad. **4** See Deutsche Bundesbank, Monthly Report, October 2014, p. 22. **5** Difference between External assets and External liabilities. **6** Euro opening balance sheet of the Bundesbank as at 1 January 1999.

XII. External sector

8. External positions of enterprises *

€ million

* The effective exchange rate corresponds to the weighted external value of the currency concerned. The method of calculating the indicators of the German economy's price competitiveness is consistent with the procedure to compute the effective exchange rates of the euro. A decline in the figures implies an increase in competitiveness. The weights are based on trade in manufactured goods and services. For more detailed information on methodology and weighting scale, see the website of the Deutsche Bundesbank (<https://www.bundesbank.de/content/796162>). 1 The calculations are based on the weighted averages of the changes in the bilateral exchange rates of the euro vis-à-vis the currencies of the following countries: Australia, Bulgaria, Canada, China, Croatia, Czechia, Denmark, Hong Kong, Hungary, Japan, Norway, Poland, Romania, Singapore, South Korea, Sweden, Switzerland, the United Kingdom and the United States. Where current price and wage indices were not avail-

able, estimates were used. 2 ECB calculations. Includes countries belonging to the group EER-19 and additionally Algeria, Argentina, Brazil, Chile, Colombia, Iceland, India, Indonesia, Israel, Malaysia, Mexico, Morocco, New Zealand, Peru, Philippines, the Russian Federation, Saudi Arabia, South Africa, Taiwan, Thailand, Turkey, Ukraine and United Arab Emirates. 3 Annual and quarterly averages. 4 Euro area countries (from 2001 including Greece, from 2007 including Slovenia, from 2008 including Cyprus and Malta, from 2009 including Slovakia, from 2011 including Estonia, from 2014 including Latvia, from 2015 including Lithuania) as well as Canada, Denmark, Japan, Norway, Sweden, Switzerland, the United Kingdom and the United States. 5 Euro area countries (current composition) and countries belonging to the group EER-19. 6 Euro area countries (current composition) and countries belonging to the group EER-42.

Overview of publications by the Deutsche Bundesbank

This overview provides information about selected recent economic and statistical publications by the Deutsche Bundesbank. Unless otherwise indicated, these publications are available in both English and German, in printed form and on the Bundesbank's website.

The printed publications are available free of charge to interested parties and may be obtained through the Bundesbank's order portal. Up-to-date figures for selected statistical datasets are available on the Bundesbank's website. In addition, the new Statistical Series provide a new basic structure and advanced options for using data and are also available on the Bundesbank's website.

■ Annual Report

■ Financial Stability Review

■ Monthly Report

A list of the articles published in the period from 2010 to 2021 is available on the Bundesbank's website.

Monthly Report articles

May 2021

- The current economic situation in Germany

June 2021

- Outlook for the German economy for 2021 to 2023
- Government finances: Central bank bond purchases increase sensitivity to interest rate changes
- Federal debt: allocate premia on accruals basis in budgetary interest expenditure
- Local government finances: how cash advances can be limited and budget imbalances avoided

July 2021

- Cross-border corporate takeovers: the impact of internationalisation on enterprises in Germany
- Crypto tokens and decentralised financial applications
- Digital risks in the banking sector
- Macroprudential policy and growth-at-risk

- The current economic situation in Germany

September 2021

- The Eurosystem's monetary policy strategy
- The impact of the Eurosystem's monetary policy on Bitcoin and other crypto tokens
- The performance of German credit institutions in 2020

October 2021

- State government finances in 2020: deficit due to temporary effects of pandemic, escape clauses also used to build reserves
- The global economy during the coronavirus pandemic
- What do households in Germany think about the digital euro? First results from surveys and interviews

- The regulation of remuneration at credit institutions

November 2021

- The current economic situation in Germany

December 2021

- Outlook for the German economy for 2022 to 2024
- German enterprises' profitability and financing in 2020

January 2022

- Changes in the secured money market
- Climate change and climate policy: analytical requirements and options from a central bank perspective
- Scenario-based equity valuation effects induced by greenhouse gas emissions

February 2022

- The current economic situation in Germany

March 2022

- Monetary policy in a prolonged period of low interest rates – a discussion of the concept of the reversal rate
- German balance of payments in 2021

■ Statistical Series*

Banks

- Banking statistics, monthly
- Statistics on payments and securities trading, September

Corporate financial statements

- Consolidated financial statement statistics, June/December
- Financial statement statistics (extrapolated results), December
- Financial statement statistics (ratios), May
- Financial statement statistics (ratios – provisional data), May

Economic activity and prices

- Seasonally adjusted business statistics, monthly

Exchange rates

- Exchange rate statistics, monthly

External sector

- Balance of payments statistics, monthly
- Direct investment statistics, April
- International investment position and external debt, monthly

Macroeconomic accounting systems

- Financial accounts, June

Money and capital markets

- Capital market indicators, monthly
- Investment funds statistics, monthly
- Securities issues statistics, monthly

■ Special Statistical Publications

- 1 Banking statistics guidelines, January 2021²
- 2 Banking statistics, customer classification, January 2022²

- 3 Aufbau der bankstatistischen Tabellen, July 2013^{1,2} 48/2021
 Do inflation expectations improve model-based inflation forecasts?
- 7 Notes on the coding list for the balance of payments statistics, September 2013 49/2021
 US trade policy and the US dollar

■ Special Publications

- Makro-ökonomisches Mehr-Länder-Modell, November 1996¹ 50/2021
 Using energy and emissions taxation to finance labor tax reductions in a multi-sector economy: An assessment with EMuSe
- Europäische Organisationen und Gremien im Bereich von Währung und Wirtschaft, May 1997¹ 51/2021
 Optimal monetary policy using reinforcement learning
- Die Zahlungsbilanz der ehemaligen DDR 1975 bis 1989, August 1999¹ 52/2021
 Exchange rate depreciations and local business cycles: The role of bank loan supply
- The market for German Federal securities, May 2000 53/2021
 Economic analysis using higher frequency time series: Challenges for seasonal adjustment
