## Overview

### War and supply bottlenecks weighing on economic recovery and driving inflation

*War against Ukraine and anti-coronavirus measures in China straining the global economy*

The consequences of Russia's war of aggression against Ukraine, which began at the end of February 2022, are weighing on the global economy. Activity is being throttled in particular by the surge in the prices of numerous commodities, which is driving up enterprises' production costs and diminishing households' purchasing power. Heightened uncertainty about the availability of key raw materials and intermediate inputs is adding to the gloom surrounding the business climate. This is affecting a number of European countries in particular that are heavily dependent on Russian energy supplies. March also saw the disruptions to international supply chains flare up again, after having previously faded into the background somewhat. Given the strict measures introduced in China to combat the spread of the coronavirus, these problems could become considerably more acute in the near future.

*Perceptible rise in commodity prices since the start of the war ...*

Following the start of the war, the prices of fossil fuels as well as some industrial metals and food, of which Russia and Ukraine are among the world's most significant producers, increased abruptly. This was mainly on account of concerns about future supply stoppages and embargo measures. After it became clear that energy commodities would initially be largely exempt from western sanctions, and with Russian commodity exports falling only moderately to date, prices declined again sizeably for the most part. Food prices, however, especially those for wheat and corn, continued to rise until this report went to press.

*... and, as a result, stronger consumer price inflation*

In combination with the strong price pressures at upstream stages of production, the high energy and food prices played a major role in the further considerable increase in consumer prices across the globe. In the industrial coun-

tries, annual consumer price inflation reached 7.6% in April, its highest level in more than 40 years. The narrower core definition of inflation, excluding energy and food, continued to climb as well, reaching 5.0%. In view of persistently high prices for commodities, transport services and other intermediate goods, consumer prices are likely to keep rising sharply in the coming months.

### Financial markets concerned over rising inflation rates and war against Ukraine

Mounting inflation concerns and the war against Ukraine also shaped developments in global financial markets in recent weeks. Given higher inflation rates and expectations, bond market yields rose markedly worldwide, also against the backdrop of key central banks pushing to recalibrate monetary policy. For example, the UK and US central banks further tightened their monetary policy stance by repeatedly raising their policy rates. In addition, the Federal Reserve announced that, starting in June 2022, it would reduce its holdings of assets purchased under monetary policy purchase programmes. The Bank of Japan, by contrast, pledged to stick to its policy of keeping yields low. The war against Ukraine added to the inflation concerns that had already been worrying market participants, not least on account of the considerably higher energy prices; the conflict ultimately also stoked expectations of a faster adjustment of the monetary policy stance. Moreover, the war increased uncertainty surrounding the economic outlook. This culminated in growing financial market volatility and a sharp but brief slump in stock prices. Significantly stronger headwinds on the stock exchanges came from the higher interest rate level. Overall, European and US stocks have declined substantially in value in the year to date. In foreign exchange markets, the feared eco-

*Financial market developments influenced by rising inflation rates, war against Ukraine and less accommodative monetary policy*

conomic fallout from the war and expectations concerning differences in the pace of monetary policy adjustment in the major currency areas pushed down the euro's exchange rate.

*Monetary policy: ECB Governing Council signals prospect of swifter normalisation*

The end of the extremely expansionary monetary policy drew closer in the euro area, too. In March, the Governing Council of the ECB decided to scale back purchases under the asset purchase programme (APP) more rapidly over the course of the second quarter than had been planned in December. April saw the ECB Governing Council conclude that the net purchases could be discontinued in the third quarter. The ECB Governing Council also amended its forward guidance on policy rates. According to the new wording, the Governing Council will make any adjustments to the key ECB interest rates "some time" after the end of the net asset purchases under the APP. With this new wording, the Governing Council is maintaining optionality in terms of the timing of its first interest rate moves. This also includes the possibility of making the first increase in key interest rates very soon after the end of the net purchases under the APP. Recent statements by numerous members of the Governing Council have given a significant push to corresponding market expectations of a first interest rate hike, with markets currently anticipating the first move in July and pricing in four 25-basis-point increases by the end of the year.

*Monetary growth flagging further*

The broad monetary aggregate M3 grew significantly in the first quarter of 2022 as well. However, growth continued to lose momentum compared to the strong inflows of the preceding quarters. This was due to the reduction in net asset purchases under the pandemic emergency purchase programme (PEPP), which were discontinued in March, as planned. At the same time, lending to the domestic private sector continued to rise sharply in the first quarter, primarily in the form of loans to households for house purchase, but also as loans to non-financial corporations. The expectation of rising bank lending rates is likely to have been an important driver of the buoyant demand for

credit. The banks responding to the Bank Lending Survey (BLS) reported that they had tightened credit standards for loans to enterprises again somewhat in the first quarter, for the first time in a year.

## **Strong recovery that would have been expected in the German economy from spring onwards significantly weakened**

Economic activity in Germany picked up slightly in the first quarter of 2022, after declining somewhat in the final quarter of 2021. According to the Federal Statistical Office's flash estimate, real gross domestic product (GDP) was 0.2% up on the quarter after seasonal adjustment. Construction provided a strong boost, helped by the mild weather conditions. On the back of a good start to the year, industrial output also increased somewhat on the quarter. The effects of Russia's war on Ukraine have been weighing considerably on the economy since the start of the conflict, however. Supply bottlenecks flared up again in industry and construction, after having arguably eased somewhat at the beginning of the quarter. The sharp rise in energy prices, too, will have dampened output. Exports declined sharply in March and were also well below the previous quarter's level in the first quarter of 2022 as a whole. High energy prices also exacerbated the already high rate of price increase, diminishing the purchasing power of household incomes. This depressed private consumption, which was impaired further by the pandemic and the associated containment measures. By contrast, construction investment and investment in machinery and equipment are likely to have increased, despite the supply bottlenecks.

This is also borne out by German banks' continued robust lending to households and non-financial corporations. Household demand for loans, especially those for house purchase, re-

*German economy weighed down by pandemic, high inflation and the Russian attack on Ukraine in Q1 2022*

*Robust uptick in German banks' loans to domestic private sector*

mained strong. In addition to their income and asset situation, which remains favourable, households' desire to lock in interest rates played a role here. Demand for loans was again high on the part of enterprises, too. The borrowed funds were used for the short-term bridging of unplanned financing needs for inventories and working capital and to fund fixed investment.

*Employment and unemployment barely touched by strains on the economy*

The German labour market developed exceptionally favourably in the first quarter of 2022. Employment expanded strongly and unemployment continued to decline markedly. In contrast to the number of hours worked per employee, which likely remains depressed, both indicators were back to where they had been just before the outbreak of the pandemic. However, this also saw the return of the labour shortages seen in pre-crisis times. The factors weighing on economic activity in the first quarter – the strong spread of the Omicron variant and, most recently, Russia's invasion of Ukraine – are more likely to have had an adverse impact on actual hours worked by employees and labour productivity. Short-time work for economic reasons increased again somewhat, for instance. Nevertheless, the leading labour market indicators remained optimistic for the coming months after having been briefly shaken by the outbreak of war.

*Negotiated wages rose considerably in Q1 due to high one-off payments; actual earnings probably rose substantially as well*

Negotiated wages recorded significantly stronger increases in the first quarter of 2022 than in the final quarter of 2021, rising by 4.4% on the year mainly as a result of high one-off payments and coronavirus bonuses. By contrast, after adjustment for such one-off payments, basic remuneration was up by only 1.6%. Actual earnings are likely to have risen even more steeply than negotiated wages in the first quarter, mainly on account of the marked decline in short-time work compared with the previous year.

At present, the growth in negotiated wages is still being influenced by existing collective agreements that had been concluded in a set-

ting of lower inflation rates and pandemic-related challenges. New agreements made in the first quarter, too, were still moderate for the most part, despite the sharp rise in inflation. Upcoming wage negotiations could, on the one hand, see the uncertainty surrounding future economic growth and concerns about potential job losses dampening wage increases somewhat. On the other hand, the persistently high inflation rates and mounting labour market shortages will probably contribute to markedly more substantial wage settlements than in the recent past. It should be borne in mind here that the increased prices for largely imported fossil fuels narrow the scope for income distribution in Germany.

Consumer prices experienced another steep rise at the beginning of the year. In the first quarter of 2022, inflation as measured by the Harmonised Index of Consumer Prices (HICP) stood at 2.8% on the quarter after seasonal adjustment. This was the strongest quarterly increase in prices in Germany since the beginning of monetary union. Energy prices picked up at a particularly rapid pace. Moreover, food price inflation and the inflation rate for non-energy industrial goods grew considerably as a result of new supply bottlenecks. Looking at the year-on-year figures, the inflation rate rose significantly in the first quarter of 2022, from 5.4% to 6.1%. By comparison, core inflation excluding volatile energy and food components came to 3.1%. It was therefore lower than in the previous quarter, when the price-driving effect of the expiry of the VAT cut was still being recorded.

In April, prices after seasonal adjustment increased considerably on the month, albeit not at the exceptional pace seen in March. This was chiefly attributable to energy prices, which eased slightly following a sharp rise in the previous month. Compared with the previous year, headline inflation came to 7.8%, up from 7.6% in March. Similarly high rates were last observed in the former West Germany during the first Gulf War at the beginning of the 1980s.

*Wage agreements still moderate so far, but distinctly larger wage increases possible in coming months*

*Inflation picked up significantly in Q1 ...*

*... and is likely to remain high for the time being*

Given this strong rate of upstream inflation, from today's perspective average inflation for the current year is expected to sit at around 7%. That said, uncertainty about the price outlook is particularly high at present.

*Economic output likely to increase slightly in Q2 at best; boost produced by easing of coronavirus protection measures counterbalanced by impact of Ukraine war*

As things stand today, German economic output is likely to increase slightly, if at all, in the second quarter of 2022. This is due to the interplay of strong but opposing forces. On the one hand, the easing of the measures to protect against the coronavirus is likely to provide a major boost to services sectors and the related consumer spending. On the other hand, the repercussions of Russia's attack on Ukraine are exacerbating the pressures exerted by high inflation and supply bottlenecks. They are also giving rise to further negative effects and will probably considerably weaken the strong recovery that had previously been anticipated. Household consumption will be dampened by the high level of inflation and by the uncertainty about how the conflict will evolve. High energy and material costs and the heightened uncertainty are also weighing on output in the industrial sector and in construction. Supply chains are once again coming under significant strain on account of the Ukraine war and COVID-19 lockdowns in China. Exports are also likely to remain markedly below the level of the first quarter due to disruptions in foreign trade and lower foreign demand as a result of the war's impact.

## Outlook for public finances in the current year and in the medium term

*Fiscal policy response to fallout from Russian war of aggression*

Fiscal policy is currently responding to the fallout, in terms of defence, energy and social policy, from the Russian war of aggression. The Federal Government is planning to step up defence spending, for example. Other measures aim to shield households and enterprises to a degree from the steeply rising energy costs. Assistance packages for refugees and for Ukraine are another factor. The measures are to be

financed by new borrowing, which is why it looks like deficits will be higher than anticipated as recently as the start of the year.

Uncertainty is, once again, very high. From today's perspective, though, the general government deficit is likely to decline significantly in this year and the next (2021: deficit ratio 3.7%). This assumes that the fallout from the war remains limited and that the coronavirus crisis does not flare up again. In that scenario, the coronavirus response measures and the new temporary assistance will probably expire and the economy could be expected to recover.

The coming years are likely to see substantial structural deficits, mainly on account of central government. Although the Federal Government announced that compliance with the debt brake would resume from 2023 onwards, it is planning to use the extensive general reserve, which will result in a correspondingly higher deficit. Additional extensive deficits are expected in the special funds. These will affect, in particular, the planned new special fund for the German armed forces and the Energy and Climate Fund (ECF). The additional leeway for deficits in the special funds as well as from the core budget reserves amounts to around €230 billion in total (currently 6% of GDP). That leeway is likely to be all but fully utilised up to 2026, meaning that the deficits could be almost 1½% of GDP higher between 2023 and 2026 than without that scope.

*Significant decline in deficit anticipated nonetheless*

*Central government expected to see substantial structural deficits in the medium term*

Central government created the broad leeway for deficits from 2023 onwards partly out of emergency borrowing from 2020 and 2021, using this primarily to top up the ECF, for example. The resources will be used to fund climate change mitigation measures for some years. However, the Federal Constitutional Court is currently assessing whether emergency borrowing from 2021 can be rolled over. In the current year, additional emergency borrowing is also planned for measures relating to the Russian war against Ukraine. There would need to be good reasons why the individual meas-

*Broad leeway for deficits due to broad interpretation of the escape clause*

ures are suited to overcoming the emergency situation. It would also have to be explained why, in the current economic setting, these need to be funded out of additional emergency borrowing (instead of counterfinancing them or using the reserve, which currently totals just under €50 billion).

## Fiscal policy in a difficult economic environment

*In a scenario of supply bottlenecks, credit-financed impulses produce smaller real effects and increased price pressures*

Government budgets are a key anchor of stability in times of crisis. That said, there is no compelling case for a large credit-financed fiscal stimulus at the current juncture, particularly in view of the high price inflation and supply bottlenecks. In an economic situation such as this, additional credit-financed demand impulses have smaller real effects and tend to increase price pressures, if anything.

*Let price signals take effect*

The objectives of energy policy are to make Germany independent of Russian energy supplies as soon as possible and to achieve net

zero carbon emissions over the long term. Price signals support these aims efficiently by indicating shortages and triggering important adjustment reactions. Government measures that reduce energy prices in the short term counteract the desired adjustment process, meanwhile.

In the current situation, low-income households need government protection. Means-tested measures such as the one-off payments for low earners can provide targeted relief here. The one-off energy price allowance will also benefit lower-income individuals to a greater degree. This allowance is a broader-based measure, however, given that all persons in employment will receive this amount, which is subject to taxation. Other parts of the since-adopted package of measures for households clash with the energy policy objectives to a degree. Targeted transfer, guarantee and loan programmes are planned for distressed enterprises. What is important is that these programmes preserve the incentive for enterprises to rapidly cut back their use of fossil fuels and to turn to renewable sources of energy.

*Targeted support for households and firms without hindering transformation*

## Global and European setting

### Global economic developments

*Outlook for global economy severely clouded by the war in Ukraine*

Russia's invasion of Ukraine, which began at the end of February 2022, has been a drag on the global economy. Activity is being throttled in particular by the surge in the prices of numerous commodities, which is driving up enterprises' production costs and eroding households' purchasing power. Heightened uncertainty about the availability of key commodities and intermediate inputs is adding to the gloom surrounding the business climate. The impact of the conflict on global economic activity is only likely to become fully apparent as the year unfolds. Nevertheless, economic dynamics were already quite weak in the first quarter of 2022. One factor in this was the spread of the Omicron variant of the coronavirus, which was a temporary drag on economic activity in many places. Against this backdrop, gross domestic product (GDP) in the euro area continued to only see muted growth. In the United States and Japan, economic output even declined slightly. The United Kingdom, by contrast, saw a marked expansion of GDP. In China, economic activity also continued to increase quite strongly, as the Omicron wave did not reach large parts of the country until the end of the quarter.

*Increasing burdens on global industrial production*

The strict measures taken in China against the spread of the Omicron variant and the Russian war against Ukraine are jeopardising the upswing in global industry. March already saw disruptions to international supply chains flare up again, after having previously faded into the background somewhat. The European automotive industry suffered production stoppages

<sup>1</sup> Empirical studies on the role of China in the slump in production observed in the EU and the United States in spring 2020 suggest that production in industries highly dependent on Chinese supplies fell significantly more sharply in March and April 2020 than in other industries. See Deutsche Bundesbank (2021) as well as Khalil and Weber (2022).

due to a lack of intermediate inputs from Ukraine. There were also signs of shortages in some of those industrial raw materials which are mainly produced in Russia and Ukraine. Owing to China's central position in cross-border value chains, business closures and logistical problems there could cause major disruptions worldwide.<sup>1</sup> According to the latest surveys of purchasing managers, price pressures at upstream stages of production have intensified. These pressures are themselves being caused by the already significant increases in the prices of a large number of commodities at the beginning of the war.

Following the Russian invasion of Ukraine, the prices of fossil fuels as well as of some industrial metals and those foods of which Russia and Ukraine are among the world's most sig-

 Deutsche Bundesbank

nificant producers surged.<sup>2</sup> This was mainly on account of concerns about future delivery stoppages and embargo measures. With the supply situation already strained, the price of Brent crude oil climbed by more than one-third in the space of a few days to just under US\$134 per barrel, its highest level in 14 years. European natural gas prices, which had already risen very sharply in the months before, almost tripled temporarily in comparison to pre-war levels. Much the same thing happened with coal prices. After it became clear, however, that energy commodities would initially be largely exempt from western sanctions, and with Russian commodity exports falling only moderately to date, most prices came back down again significantly. Growing concerns about Chinese demand in relation to their zero-COVID policy also played a role in the decline in prices.<sup>3</sup> So far, in May, prices for crude oil (at US\$110 per barrel) and European natural gas had exceeded their levels before the war by around 13% and 9%, respectively. Prices for industrial raw materials such as palladium, nickel and aluminium also rose, in some cases significantly, at the beginning of the war, before more recently falling below their pre-war levels on balance. By contrast, food prices, particularly those for wheat and corn, continued to rise until recently and were, on the whole, close to their all-time high at the time this report went to press.

High energy and food prices were a driving force behind the renewed sharp rise in consumer price inflation around the world. In the advanced economies, annual consumer price inflation reached 7.6% by April, its highest level in more than 40 years. The narrower core definition of inflation, which strips out energy and food, continued to climb as well, reaching 5.0%. In view of persistently high prices for commodities, transport services and other

*Increased consumer price inflation*

**2** For information on the importance of Russia as a commodity exporter, see Deutsche Bundesbank (2022) pp. 18 f.  
**3** The release of record high quantities of strategic oil reserves in some producing countries, especially the United States, also dampened crude oil prices. See International Energy Agency (2022).

intermediate goods, consumer prices are likely to keep rising sharply in the coming months.

*IMF raises its inflation forecast for 2022 significantly*

Against this background, the International Monetary Fund (IMF) significantly raised its inflation forecast for advanced economies for the current year and again stressed the upside risks to this outlook.<sup>4</sup> At the same time, the IMF lowered its global growth forecast for 2022 by 0.8 percentage point to 3.6%. This was mainly due to the war in Ukraine and the western sanctions against Russia, which are likely to plunge the Russian economy into a severe recession. Moreover, the outlook deteriorated particularly sharply for those European countries that are closely economically interconnected with Russia or Ukraine owing to their geographical proximity or are heavily dependent on Russian energy supplies. For the United States and China, the IMF reduced its GDP forecasts only slightly, despite country-specific factors such as the expected tightening of monetary policy in the United States and the strict zero-COVID strategy in China.

## China

*Economy suffering from strict anti-coronavirus measures for several weeks*

For several weeks now, the Chinese economy has been severely affected by strict anti-coronavirus measures. The cities of Shenzhen and Shanghai, with 18 and 26 million inhabitants, respectively, have been in a hard lockdown for weeks. The containment measures had only a tentative impact on economic output in the first quarter. According to official data, real GDP growth even accelerated markedly to 4.8% on the year.<sup>5</sup>

*Marked dampening effect on economic output in the second quarter likely*

However, as the Chinese government continues to pursue its rigorous zero-COVID policy in the fight against the virus, a strong dampening effect on economic output in the second quarter is to be expected. Private consumption, in particular, is set to decline significantly. Chinese exports are also likely to feel the effects. Although the authorities have tried to allow industrial and port facilities to continue to oper-

### Composite Purchasing Managers' Indices in selected large emerging market economies

Seasonally adjusted, monthly data

Source: S&P Global.  
 Deutsche Bundesbank

ate, there have already been considerable production and transport disruptions. This is also likely to impair global supply chains over the next few months. In view of the severe strain the economy is under, the authorities have announced economic stimulus measures. No major monetary policy stimuli have been used so far, however, although China was one of the few countries in which the rise in consumer prices has not accelerated in recent months. In April, the year-on-year rate of inflation was

<sup>4</sup> See International Monetary Fund (2022).

<sup>5</sup> Compared with the previous period, real GDP rose by a seasonally adjusted 1.3%, which was slightly less than in the final quarter of 2021.

2.1%; excluding energy and food, it was as little as 0.9%.

## Other selected emerging market economies

*Further recovery in India*

India's economic upturn continued in the first quarter of 2022, although the new coronavirus wave at the beginning of the year is likely to have slowed growth somewhat. In the final quarter of 2021, real GDP had already once again clearly exceeded its pre-pandemic level. The export industry has become an important driver of growth in recent quarters, having benefited from, among other things, some large multinational enterprises relocating to India. In the first quarter of 2022, goods exports (in US dollar terms) exceeded the level at the start of the pandemic by just under one-half. Consumer price inflation increased markedly to 7.8% in April against the backdrop of higher food prices. The central bank therefore raised its policy rate at the beginning of May for the first time since 2018, by 40 basis points to 4.4%.

*Economic activity in Brazil remains listless*

Economic activity in Brazil is likely to have remained anaemic in the first quarter of 2022. Real GDP has been more or less stagnant since as early as the beginning of 2021. Economic output has recently slightly exceeded pre-crisis levels, yet private consumption is still lagging significantly behind. This is also due to the fact that real disposable income fell significantly last year, owing to the sharp rise in prices. Consumer price inflation has continued to accelerate in recent months, reaching 12.1% in April. The central bank has therefore continued to tighten its monetary policy. Since February 2021, it has already raised its policy rate by a total of almost 11 percentage points to 12.75% at the end of the period under review.

*Russia facing severe economic crisis as a result of western sanctions*

Russia's economy is facing a severe recession owing to the consequences of the Russian invasion of Ukraine. Economic sanctions imposed by western countries, such as the exclusion of

Russian banks from the international payment system SWIFT or restrictions on the export of high-tech goods to Russia, have had a particularly significant impact. Russian industry has thus been cut off from important foreign intermediate goods.<sup>6</sup> In addition, many foreign enterprises have ceased business with Russia on their own initiative. Oil and gas exports, the main pillar of the Russian economy, have so far only been partially affected by sanctions and voluntary boycotts. The sharp rise in energy prices is actually gifting Russia with exceptionally high foreign exchange revenue at present. This is another reason why the rouble has more than made up for its initially sharp losses in value. In the future, however, Russian energy exports are also likely to suffer considerable losses, especially if sanctions are expanded. All in all, Russia is thus at risk of large welfare losses over the longer term (see the box on pp. 15 f.). Consumer price inflation surged in the first weeks of the war. Given the subsequent stabilisation of the rouble, however, the inflation rate increased only slightly to 17.8% in April. This allowed the central bank to lower its policy rate, which it had raised substantially to 20% at the beginning of the war, to 14% at the end of the period under review.

## United States

In the first quarter of 2022, the economic upturn in the United States halted for the first time since the end of the pandemic-induced recession. According to initial estimates, GDP fell by 0.4% on the quarter after price and seasonal adjustment. Nevertheless, the underlying cyclical trend would appear to be intact. Private domestic final demand, often used as a yardstick for said trend, expanded rapidly. Households increased their consumption again, despite considerable losses in purchasing power as a result of the sharp rise in prices. In fact, after

*Q1 decline in GDP likely only temporary*

<sup>6</sup> According to official Russian data, industrial production was still fairly robust in March. However, major difficulties in the production process are likely to arise once inventories of intermediate goods have been exhausted.

## The possible longer-term impact of the Ukraine war on the Russian economy

Russia's economy faces a severe crisis owing to the far-reaching sanctions imposed by western countries and decisions by many foreign enterprises to sever their trading relationships with Russia or cease doing business in the Russian market. The International Monetary Fund (IMF), writing in the April 2022 edition of its World Economic Outlook, forecasts that real gross domestic product (GDP) will shrink by 8.5% this year. Other institutions are predicting that the decline will be significantly heavier still.<sup>1</sup> For the coming year, the IMF is expecting the downward movement to continue, albeit at a much slower pace. The scale of the looming recession is thus likely to far eclipse even the sharp decline in GDP seen during the global financial crisis of 2009.

While the economic downturn back then came in the wake of a protracted and robust upswing, Russia's economy was already lethargic before the current crisis occurred, with real GDP growing by a meagre 0.9% per year on average between 2013 and 2021. Measured in terms of US dollars and current prices, economic output per capita even declined markedly, shrinking from US\$15,900 to US\$12,200. One notable factor behind this loss of income was the significant drop in the price of oil, and thus in Russia's export revenues, during this period.<sup>2</sup>

To reduce its reliance on energy exports, the Russian government has been striving for several years to promote industry and other non-commodity sectors. One measure saw the government pursue an import substitution policy, partly also in response to the economic sanctions imposed by

western countries in connection with the annexation of Crimea in 2014. This strategy met with little success overall, however. In particular, Russia failed to build up domestic production operations in the high-tech sector that meet western quality standards.

Russia thus remains heavily dependent to this day on foreign intermediate goods, particularly from the EU and other advanced economies. The new export bans introduced by western countries and the supply restrictions imposed by many enterprises are therefore likely to hurt Russian industry in particular. In a recent central bank survey, almost 40% of industrial enterprises reported that they were finding it difficult to source alternative suppliers.<sup>3</sup> Surveys among purchasing managers, furthermore, indicate that delivery times for intermediate goods in manufacturing have increased sharply, which is a sign that firms are experiencing considerable supply chain problems. Russian exporters, meanwhile, need to scout for new sales markets and logistical opportunities. Overall, Russian industry faces the prospect of severe efficiency losses and technological regression now that the country has been largely ostracised from the international community.

---

<sup>1</sup> The Bank of Russia, too, is expecting GDP to contract by between 8% and 10% this year. See Bank of Russia (2022).

<sup>2</sup> The price of oil plummeted between mid-2014 and early 2016 as the United States stepped up the production of shale oil, and it did not make a full recovery. See Deutsche Bundesbank (2016) for the impact of the oil price slump on the Russian economy.

<sup>3</sup> Russian firms are likely to step up their efforts to source supplies from Asia over the medium and long term. Whether and to what extent trading partners there are willing to do business with them is questionable, however. China, in particular, is unlikely to want to run the risk of undermining western sanctions. See Simola (2022).

Services was home to a small number of up and coming business areas before the war broke out, such as the IT sector and finance. They, too, are likely to face stiff headwinds. Recent years have already seen an exodus of highly skilled workers from Russia,<sup>4</sup> and the brain drain looks set to increase further because of the war in Ukraine. Reports suggest that tens of thousands of IT specialists have turned their backs on Russia since the conflict erupted.

All these challenges would suggest that the Russian economy's reliance on oil and gas exports in the coming years will arguably be even greater than it is today. But with many buyers exercising restraint, Russia is currently having to grant hefty price discounts on its oil exports.<sup>5</sup> In addition, the subdued demand may soon leave Russia with no choice but to significantly cut its oil production. The latest forecast by the Oxford Institute for Energy Studies (2022) indicates that oil production is likely to decline from the pre-war level of 11 million barrels per day (mb/d) to around 9 mb/d by the end of 2022. The planned EU embargo could even push this figure down to less than 7 mb/d by year-end.<sup>6</sup>

Russia's gas deliveries are more focused than even its oil exports on Europe as a sales market. Only a very small fraction of Russian gas exports are currently routed via pipelines to China, and the major Western Siberian Yamal gas fields that supply Europe are not even linked up with Asia yet. That situation would only change when the proposed additional pipeline (Power of Siberia 2) goes into operation. However, the negotiations between China and Russia on the terms and conditions of construction are likely to last a few years yet. This contrasts with plans by Germany – currently Russia's most important gas customer – to wean itself off Russian gas by 2024 at the latest. Moreover, it is unclear whether Russia will even be able to shoulder this colossal infrastructure project, with all the sanctions in place.

All in all, the Russian economy not only faces sizeable drops in activity in the short term but also significant scarring in the longer term as a result of the war. The structural problems that already surfaced in recent years will probably become considerably more acute. Overall, Russia is heading towards a situation where it loses a considerable share of its welfare on a lasting basis.

<sup>4</sup> Official figures indicate that overall, for every ten people who left Russia fifteen migrated to Russia between 2015 and 2020. However, these were mainly low-skilled workers from other CIS countries. Despite the positive migration balance, the number of people of working age has shrunk by around 8% since 2010. These demographic strains are likely to persist in the years ahead.

<sup>5</sup> Russia's Urals brand of crude oil is currently trading at a discount of around US\$35 per barrel to the North Sea Brent variety.

<sup>6</sup> This forecast seems to be based on the assumption that Russia will probably find it difficult to ship oil originally destined for Europe to Asia by sea. That would call for the mobilisation of a significant fraction of the global fleet of oil tankers. In addition, western countries are looking to clamp down on sanctions-evading transactions of this kind.

price adjustment, expenditure on services exceeded pre-pandemic levels for the first time. Investment in private housing construction rose once again. Spending on new machinery and equipment in trade and industry even expanded very considerably. There was also a similarly steep rise in imports. At the same time, the weaker global economy was reflected in a decline in exports. In addition, the reduced build-up of inventories and the further decline in government demand were a drag on economic growth.

*Monetary policy  
turnaround  
initiated*

By contrast, the US labour market continued its recovery. The unemployment rate almost returned to pre-pandemic levels. At the same time, numerous job openings remained vacant. Given the high demand for labour, wage growth continued to accelerate, while nevertheless remaining below the rise in consumer prices. Consumer price index (CPI) inflation rose to 8.5% in March and fell only slightly in the past month. Against this background, the US Federal Reserve tightened its monetary policy stance, raising its policy rate by a total of 75 basis points in March and May.

## Japan

*Slight decline in  
GDP*

The rebound in the Japanese economy stalled over the winter. According to the initial official estimate, real GDP in the first quarter fell by a seasonally adjusted 0.2% on the previous quarter. Private consumption stagnated as a result of the rapid spread of the Omicron variant at the beginning of the quarter. Although sickness-related losses of working hours and renewed supply bottlenecks weighed on Japanese firms at the beginning of the year, business investment increased slightly in the first quarter. Imports also picked up substantially. By contrast, there was only a slight increase in exports. Government demand was cut back once again. Labour market conditions continued to improve. The seasonally adjusted unemployment rate declined to 2.6% by March. Annual CPI inflation increased to 2.5% in April,<sup>7</sup> ex-

ceeding the Japanese central bank's inflation target for the first time since 2015. However, the central bank assessed the increase in price inflation as temporary and maintained its expansionary stance.

## United Kingdom

The UK economy grew at a slower, but nonetheless solid pace in the first quarter of 2022. According to initial estimates, price and seasonally-adjusted GDP rose by 0.8% on the quarter. This was the first time that the pre-crisis level had been exceeded. The recovery was broadly based across sectors. In particular, high-contact services benefited from the ebbing of the Omicron wave. In the hotel and restaurant sector, real gross value added rose by more than 5%. Construction activity and the manufacturing sector also grew more buoyantly at the beginning of the year than in the previous quarter. However, many industrial enterprises are increasingly complaining about the persistently surging prices for intermediate inputs as well as about supply bottlenecks and labour shortages. The unemployment rate fell to 3.7%, below the low of December 2019. Against this backdrop, wages rose significantly. Annual Harmonised Index of Consumer Prices (HICP) inflation rose sharply, reaching 9% by April. The Bank of England subsequently raised its policy rate by a further 25 basis points to 1% in May and announced additional tightening over the next few months.

*Marked growth  
in GDP*

## Poland

Poland's economic upswing continued in the first quarter of 2022. Real GDP grew by 2.4% after seasonal adjustment. The renewed strong

*Upswing robust  
so far*

---

<sup>7</sup> In addition to the rise in energy prices, one reason for this was the expiry of a one-off effect. The substantial reduction in mobile phone charges triggered by a reform in April 2021 had pushed down annual CPI inflation by 1.4 percentage points in March. In April, the decline in mobile phone charges dampened the inflation rate by only 0.6 percentage point.

### Real GDP in selected industrial countries

Q4 2019 = 100, seasonally and calendar adjusted, log scale

Sources: Bureau of Economic Analysis, Cabinet Office of Japan, Office for National Statistics, Statistics Poland and Bundesbank calculations.  
 Deutsche Bundesbank

GDP growth was mainly driven by the further expansion of industrial output. However, consumption activity was also buoyant, with the very favourable labour market situation likely to have been one reason for this. The unemployment rate stood at just 3% in March, and gross average wages in the corporate sector rose by 12.4% on the year. Russia's invasion of Ukraine also represents a turning point for Poland. At 3.7% of total exports, its share of exports to Russia is almost twice as high as that of Germany. In addition, Poland is the main destination for refugees from Ukraine.<sup>8</sup> However, the commodity crisis and the Russian gas embargo have not caught the country off guard. Poland has been in the process of reducing its energy dependency on Russia for years.<sup>9</sup> Despite price-dampening measures introduced by the government, consumer price inflation increased to 12.4% by April. Energy and food accounted for a considerable share of this, but the core rate excluding these components also rose to 7.7%. As a result, the Polish central bank raised its

policy rate in four further increments between February and May by a total of 300 basis points to a current level of 5.25%.

## Macroeconomic trends in the euro area

The euro area economy also grew only slightly in the first quarter of 2022. According to Eurostat's flash estimate, GDP rose by 0.3% on the quarter after price and seasonal adjustment, thereby exceeding its pre-pandemic level by 0.5%. At the beginning of the quarter, the Omicron wave, in particular, weighed on services sector activity. Towards the end of the quarter, the impact of the war prevented a stronger recovery. As a result, parts of industry experienced production stoppages and private consumption suffered from the erosion of purchasing power caused by energy prices.

*Further slight increase in economic activity*

In the medium term, too, the impact of the war on Ukraine is likely to weigh on the euro area economy, especially if the conflict escalates further and associated sanctions and retaliatory measures are expanded.<sup>10</sup> In addition to higher energy prices, the heightened uncertainty, for example regarding the reliability of the energy supply, and possible supply stoppages for other commodities, are the main constraining factors. Conversely, the export losses in the Russian sales market are likely to be of lesser importance. Russia accounted for merely 3% of euro area goods exports in 2021.

*Ongoing strains caused by the war on Ukraine*

By contrast, the burdens caused by the coronavirus pandemic are likely to wane further. The

<sup>8</sup> According to the Polish Border Guard, more than 3.2 million refugees from Ukraine have entered Poland to date, although they have by no means all remained there. In Poland, Ukrainians can take up work without a work permit for six months within one year. In the years prior to the war, there were already up to 1.7 million such employment contracts per year.

<sup>9</sup> Poland has had an LNG terminal for importing liquefied gas since 2015. Moreover, the new Baltic Pipe system is scheduled to be completed this year, which will allow pipeline-based gas imports from Norway.

<sup>10</sup> See Deutsche Bundesbank (2022).

*Pandemic-related burdens waning*

economic impact of the Omicron wave at the beginning of the year was already much smaller than previously expected. Although, for a time, a considerable number of working hours were lost due to illness, these absences were mostly short-lived and the health system was not overwhelmed as had been feared. As a result, containment measures were further eased, which benefited service providers in particular.

*Subdued consumption activity ...*

Consumption activity in the euro area remained subdued in the first quarter of 2022. After the recovery phase in the final quarter of 2021, retail sales fell again in price-adjusted terms. New motor vehicle registrations even dropped quite substantially again and were down by one-third on their pre-pandemic level. This was probably partly due to supply difficulties for intermediate input products for motor vehicle production worsening again in connection with the Ukraine war. In any event, according to European Commission surveys, the propensity to purchase passenger cars decreased only slightly. The consumption of services is also likely to have barely increased on a quarterly average, although it made a clear recovery over the course of the quarter once various infection protection measures had been eased.

*... also due to the pronounced losses in purchasing power*

A major reason for the subdued development of private consumption is likely to have been the significant deterioration in households' financial situation. In the first quarter, consumer prices rose by no less than 6.1% on the year. The increase in the wage bill is expected to have lagged considerably behind this. The various fiscal relief measures are also unlikely to have made up for the losses in purchasing power.<sup>11</sup> As a result, consumer confidence fell distinctly below its long-term average until March, according to European Commission surveys.

*Investment remains on an upward trajectory*

Gross fixed capital formation is likely to have risen further in the first quarter.<sup>12</sup> Construction output rose very robustly. The upward trend in investment in information and communication technologies and intellectual property seems to

### Aggregate output in the euro area

Real GDP, Q4 2019 = 100, seasonally and calendar adjusted, log scale

Sources: Eurostat and Bundesbank calculations.  
 Deutsche Bundesbank

have continued. By contrast, expenditure on transportation probably declined. In any case, the number of commercial vehicle registrations fell very steeply again, which is likely to have been partly due to supply bottlenecks. By comparison, investment in other machinery and equipment probably increased markedly. In January and February, capital goods producers'

<sup>11</sup> See Sgaravatti et al. (2022) for an overview of the fiscal measures taken to cushion the increase in energy prices.

<sup>12</sup> Excluding Ireland. For several years now, the statistical recording of investment as a whole, and of investment in intellectual property in particular, has been strongly influenced by the strategic planning of multinational enterprises in that country. See Deutsche Bundesbank (2018).

### Consumer sentiment in the euro area\*

Balance of positive and negative responses as a percentage of all responses, seasonally adjusted, monthly data

 Deutsche Bundesbank

domestic sales significantly exceeded the previous quarter's level after price adjustment.

*Goods trade with third countries sees strong growth given surging prices*

Euro area countries' exports of goods to third countries continued to increase in the first quarter after price adjustment. This is likely to have been due, in particular, to favourable global industrial activity at the beginning of the year, but also to the depreciation of the euro in recent months. In terms of value, goods exports even rose by a very substantial degree again in the light of continued surging prices. This was particularly true of goods exports to the United States. Exports to China also expanded visibly. By comparison, exports to Russia declined significantly under the influence of the war on Ukraine. According to figures from the balance of payments, the recovery of services exports from the euro area to third countries slowed markedly. One reason for this was probably the pandemic-induced slump in tourism at the beginning of the year. Goods imports to the euro area from third countries in-

creased only marginally in real terms in the first quarter. The largest increases were consistent with the robust investment activity in intermediate and capital goods, whilst imports of consumer goods declined. In terms of value, imports rose very sharply amidst the considerable price increases.

The upward movement in manufacturing continued at the beginning of the year, mainly due to the at times marked easing of some supply bottlenecks coupled with well-filled order books. The outbreak of the war has directly hampered those sectors, in particular, whose supply chains extend to Ukraine and Russia. This includes, above all, motor vehicle manufacturers. Moreover, the sanctions prevented certain products from being delivered and orders were not placed. In addition, the costs for intermediate goods continued to rise. In view of the heightened uncertainty, the order situation deteriorated somewhat. All of this contributed to a significant decline in industrial production in March. Nevertheless, capacity utilisation picked up slightly between January and April, thus continuing to exceed the long-term average. Industrial producer prices rose at a faster pace. Price inflation was especially pronounced for intermediate goods but it also increasingly extended to capital and consumer goods.

*Situation in manufacturing strained again recently*

Economic output in various services sectors is likely to have recovered at the end of the quarter. Especially hotels and restaurants as well as art and cultural activities widened their services considerably following the easing of containment measures. As businesses were still subject to extensive restrictions at the beginning of the year, on a quarterly average the previous quarter's level was probably just maintained. By contrast, various business-related services are likely to have expanded further. Activity in the information and communications sector increased particularly significantly once more.

*Service providers see slight recovery at the end of the quarter*

In most Member States, economic output increased in the first quarter of 2022. The main

*Economic output rose in most Member States*

factors behind the remaining growth disparities were the effects of the last wave of the pandemic, the impact of the war on Ukraine and sanctions on Russia.

rise in consumer prices, especially for energy, were a much more significant factor. The continued recovery of tourism had a counterbalancing effect.

*French economy stagnates*

In France, real GDP in the first quarter stagnated at the previous quarter's level. The decline in private consumption, in particular, was a drag. Especially at the beginning of the quarter, the consumption of services was restricted against the backdrop of the resurgent infection rates. The consumption of goods likewise declined significantly. This is likely to have been partly due to greater price pressures despite the energy price brake. Investment remained on a moderate upward trajectory, by contrast. Although services exports rose markedly once more, the pandemic is likely to have distinctly slowed business activity in the tourism sector. Growth in goods exports weakened significantly, as did growth in goods imports.

In Austria and Portugal, GDP increased considerably once most infection protection measures had been lifted, with tourism likely to have played a key role. In Belgium, real GDP rose moderately. Despite potentially considerable strains caused by the war on Ukraine, activity also increased in Finland, Slovakia, Lithuania and Latvia, probably mainly as a result of the good start to the year once the infection protection measures had been eased. GDP in the Netherlands was unchanged.

*Marked differences in the smaller Member States*

*Decline in Italy's real GDP*

In Italy, too, the recovery in macroeconomic activity came to a standstill at the beginning of the year. According to preliminary data, real GDP fell by as much as 0.2% in the first quarter, thus remaining slightly below its pre-crisis level. A key reason for this was a pronounced setback in industrial production, which was probably due in part initially to a shortage of intermediate input products and later to business with Russia coming to a halt and the steep rise in energy prices. The services sector, too, generated only very little stimulus. Domestic tourism collapsed at the beginning of the year, and the number of foreign tourists has not yet returned to pre-pandemic levels, either.

The labour market situation improved once again in the euro area. The unemployment rate fell to a new low of 6.8% in March 2022 and the number of persons in employment continued to rise in the first quarter. The employment outlook deteriorated markedly in industry and services over the course of the quarter. At the same time, surveys indicate that the shortage of labour was more pronounced than ever before. The rise in gross wages and salaries per employee is likely to have accelerated further in the first quarter, in part due to minimum wage hikes. However, the increases are not likely to have kept pace with inflation, meaning that real wages probably declined.

*Further improvement in labour market situation at the beginning of the year*

*Activity in Spain continuing to rise, but significantly more slowly*

According to preliminary estimates, in Spain aggregate output in the first quarter rose slightly by 0.3% on the quarter. At 3.5%, the gap compared with the pre-crisis level thus remained significantly larger than in the other euro area countries. Here, too, a decline in private consumption was the main reason for the slowdown in the recovery, with the pandemic likely to have played only a minor role. Losses in purchasing power as a result of the sharp

Consumer price inflation intensified in the euro area in the first quarter of 2022. The HICP increased by a seasonally adjusted 2.7% on the quarter. Prices for energy and other industrial goods, in particular, rose more sharply than ever before. Food prices saw their steepest growth since 2007, and the rise in services prices also remained exceptionally strong. Annual headline HICP inflation subsequently jumped from 4.6% in the fourth quarter to 6.1%, with energy prices rising by 35%. The inflation rate excluding energy and food grew from 2.4% to 2.7%.

*Surge in consumer prices in Q1 2022*

Source: European Commission. \* Deviations from the respective average since 2000.

Deutsche Bundesbank

*Persistent price pressures stemming from upstream stages*

The main reason behind the accelerated consumer price inflation is the increase in cost pressures at upstream stages. Crude oil prices and wholesale prices for natural gas continued to rise as a result of the Ukraine war, as did other commodity prices, and supply bottlenecks intensified again. For example, European

cereal prices rose by more than 10% on the quarter and by more than 50% on the year. The price of industrial inputs increased by a further 6% on the quarter and by more than 20% on the year. Although these broad-based cost pressures have already been clearly reflected in consumer prices, they are unlikely to have been passed through in full yet.

In April, the annual HICP rate remained at 7.4%, as in the previous month. Annual rates of change in prices of food, services and non-energy industrial goods reached their highest levels since the beginning of monetary union. The inflation rate excluding energy and food picked up robustly from 3.0% to 3.5%. According to market and survey-based inflation expectations, inflation rates are expected to normalise only very gradually. Inflation expectations for 2023 are still significantly elevated. At present, they are not moving towards the 2% mark again until 2024 (see p. 44).

*Inflation rate remained at all-time high in April*

In the current quarter, economic development is likely to be largely slowed by the impact of Russia's invasion of Ukraine and the resulting sanctions. High commodity prices, especially for energy, are a considerable drag, and there is a great deal of uncertainty about the stability of the supply of commodities. While industrial enterprises are increasingly trying to tap alternative delivery channels and safeguard value chains, this costs time. Supply bottlenecks are also likely to intensify in the face of pandemic-related restrictions in China. All of this is visibly weighing on business sentiment, especially in industry. Sentiment among service providers, who can hope to benefit from the easing of infection protection measures, remained more upbeat. However, they, too, might feel the effects of the restraint shown by households, who are suffering from the erosion of purchasing power as a result of the sharp rises in prices. According to European Commission surveys, consumer confidence, including, in particular, the propensity to make purchases and expectations with regard to the future financial situation, deteriorated again in April and fell clearly

*Distinct negative effects in the current quarter due to rising costs and heightened uncertainty*

below the long-term average. This could significantly impair the robust recovery in private consumption expected before the outbreak of the war.

## Monetary policy and money market developments

*ECB Governing Council decides to scale back net purchases under the APP more rapidly*

In March, the Governing Council of the ECB decided to scale back net purchases under the asset purchase programme (APP) more rapidly than had been planned in December. As a result, monthly net purchases, which amounted to €40 billion in April, will be reduced to €30 billion in May and €20 billion in June. If the incoming data support the expectation that the medium-term inflation outlook will not fall below the 2% inflation target again, even after the end of net purchases under the APP, the Governing Council will discontinue net purchases in the third quarter. In April, the Governing Council judged that the incoming data since its March meeting reinforce its expectation that net asset purchases under the APP should be discontinued in the third quarter.

*Adjustment of forward guidance on policy rates*

The ECB Governing Council also adjusted the forward guidance on its key interest rates at its March meeting. According to the new wording, the Governing Council will make any adjustments to the key ECB interest rates “some time” after the end of the net purchases under the APP. Any adjustments that take place will

be gradual. With this new wording, the Governing Council is maintaining optionality in terms of the timing of the first interest rate moves.

The decisions in March and April were taken against the background of further increasing inflationary pressures. The published inflation data for January, February and March were also well above the previous expectations. Unexpectedly high energy costs are one major reason for this. Price increases have also become more broadly based. Measures of underlying inflation have risen to levels above 2% in recent months. The new ECB staff projections again revised the baseline scenario for inflation significantly upwards compared with December, to 5.1% in 2022, 2.1% in 2023 and 1.9% in 2024. However, the war against Ukraine is a substantial upside risk to inflation, especially for energy prices. If the resulting price pressures feed through into higher than anticipated wage rises or if there are persistent, adverse supply-side disruptions, inflation could turn out to be higher over the medium term than in the baseline scenario. In April, the ECB Governing Council noted that inflation had again increased significantly and will remain high over the coming months, mainly because of the sharp rise in energy costs. Inflation pressures have intensified across many sectors. The upside risks surrounding the inflation outlook have also increased, especially in the near term, and a correction of inflation expectations to levels above the inflation target is likewise among the current risk factors for persistently high inflation rates.

*Inflation still higher than expected and with upside risks*

The euro short-term rate (€STR) showed little change overall and was down slightly at -0.59% at the end of the period under review. The three-month EURIBOR, by contrast, continued to climb perceptibly as it had done since February. It recently stood at -0.38%, which was around 15 basis points higher than in mid-

*Little change in the €STR; further increase in the EURIBOR*

## Money market management and liquidity needs

In the period under review from February to April 2022,<sup>1</sup> excess liquidity in the Eurosystem rose by a total of €94.3 billion to an average of €4,485.4 billion. It initially increased by €101.7 billion to €4,492.8 billion in the first reserve maintenance period of 2022 (February-March), before dipping slightly by €7.4 billion in the second reserve maintenance period (March-April). On the one hand, this was due to a reduction in liquidity-providing asset purchases owing to the discontinuation of the pandemic emergency purchase programme (PEPP) on 31 March 2022. On the other, liquidity-absorbing autonomous factors increased more strongly in the second maintenance period of the year than in the first.

In the period under review, additional central bank liquidity was provided primarily through €139.0 billion worth of net asset

purchases under the purchase programmes. The bulk of these purchases was attributable to the PEPP. As at 13 May 2022, the balance sheet holdings of the asset purchase programmes amounted to €4,940.6 billion (see the table on p. 26). By contrast, the average outstanding tender volume in the euro area fell slightly by €1.7 billion to €2,200.1 billion in the period under review, resulting in a low level of liquidity absorption. After the final targeted longer-term refinancing operation of the third series (TLTRO-III) had been allotted in December 2021, a total of €1.8 billion was voluntarily repaid on 30 March 2022 under TLTRO-III operations one to seven. Moreover, during the period under review, liquidity amount-

<sup>1</sup> The averages of the second reserve maintenance period of 2022 (March-April 2022) are compared here with the averages of the eighth reserve maintenance period of 2021 (December 2021-February 2022).

<sup>1</sup> Changes due to net purchases, maturities, reinvestments and amortisation adjustments.

Deutsche Bundesbank

ing to €0.4 billion was repaid at maturity under the pandemic emergency longer-term refinancing operations (PELTROs). Uptake of the regular main refinancing operations and three-month tenders likewise remained very subdued. In Germany, the outstanding volume of all refinancing operations fell by €1.1 billion to an average of €420.8 billion. As a result, German banks' share of the outstanding tender volume in the Eurosystem came to around 19.1%.

In the second reserve maintenance period of 2022, liquidity needs stemming from autonomous factors rose by €41.7 billion com-

pared to the eighth maintenance period of 2021, reaching a new record average high of €2,447.2 billion. This was mainly due to an increase in government deposits of €85.7 billion to €667.8 billion. Another liquidity-absorbing effect was caused by the volume of banknotes in circulation rising by €35.3 billion to €1,575.9 billion (see the table on p. 25). By contrast, the decline in the balances of non-euro area central banks, which is included under "other factors", had a liquidity-providing effect. A large part of these amounts was held in Germany. The €8.9 billion decline in government deposits with the Bundesbank likewise provided liquidity. Net banknote issuance, which absorbs liquidity, went up markedly by €18.6 billion to €902.4 billion in Germany. Over the reporting period, the minimum reserve requirement in the Eurosystem climbed by €1.4 billion to €156.8 billion in the March-April maintenance period, thus further increasing the need for central bank liquidity. In Germany, the reserve requirement went up by €0.8 billion to €43.3 billion.

At 99%, banks' utilisation of exemption allowances under the two-tier system for remunerating excess reserve holdings remained virtually unchanged for both the euro area and Germany in the period under review. As excess liquidity rose by €94.3 billion and the absolute exemption allowance increased less sharply, the share of excess liquidity remunerated at -0.50% expanded (see the chart on p. 27). As a result, an average of 20.7% of the excess liquidity in the Eurosystem was exempt from negative remuneration in the second reserve maintenance period of 2022, which was 0.4 percentage point less than in the previous maintenance period (in Germany: 20.1%, previous period: 20.9%).

Overnight rates in the euro money market continued to be based on the deposit facility rate of -0.50% (see the chart above). However, given the ongoing downward trend in overnight rates amidst high excess liquidity, the spread to the deposit facility rate widened slightly in the reporting period. By contrast, the increase in rate hike expectations did not affect the very short end of the money market. In both the first and the second maintenance periods of 2022, the unsecured euro short-term rate (€STR) was set at an average of -0.58%. At the end of the quarter in March, €STR fell by one basis point on the day to -0.59%. At €57.0 billion, turnover in the first maintenance period of 2022 was high on average, before falling to €51.8 billion in the following period. The decline was due to lower market liquidity on public holidays and at the end of the quarter. On the GC Pooling trading platform, the period under review saw overnight transactions in the ECB basket being conducted at an average of -0.57% in the first maintenance period of 2022 and -0.59% in the second, compared with the previous figure of -0.56% in the eighth maintenance period of 2021. By contrast, in the ECB EXTended basket, which has a broader selection of securities with lower rating requirements for concluding repo transactions, overnight trading was carried out at rates of -0.53% and -0.54% in the reporting period. This exceeded the average level of -0.56% in the preceding period (the eighth maintenance period of 2021), which was influenced by a sharp temporary decline at year-end. The usual pattern of lower overnight rates at the end of the quarter was visible at the end of March 2022, too. On this day, the price of secured overnight money in the ECB basket decreased significantly for low volumes, falling by around 20 basis points to -0.80%. In the ECB EXTended basket, however, there was only a marginal decline to -0.57%.

### Deposit facility rate, money market rates and excess liquidity

Sources: ECB, Eurex Repo and Bundesbank calculations. **1** Central bank balance minus the minimum reserve requirement plus the deposit facility. **2** The last period displayed is still ongoing.  
 Deutsche Bundesbank

Liquidity-driven secured turnover on the GC Pooling platform remained low in both baskets during the period under review (at around €1.0 billion in the ECB basket and around €2.0 billion in the EXTended basket). The low turnover volumes are likely to have contributed to the fact that GC Pooling overnight rates remained significantly more volatile than €STR in the period under review.

February. The increase in the EURIBOR is probably mainly due to the stronger pricing-in of expectations of a rise in key monetary policy rates in the near future.

*Money market forward rates reflect expectations of swifter normalisation of monetary policy*

While short-term money market rates have shown mixed developments since mid-February, money market forward rates have continued to climb, thus reflecting market participants' expectations of an earlier and swifter normalisation of monetary policy. Market participants recently priced in an initial interest rate hike of 25 basis points in July 2022. The steeper path of the forward curve also suggests that market participants are pricing in three further interest rate increases of 25 basis points this year. The Eurosystem's Survey of Monetary Analysts (SMA), conducted prior to the March and April meetings, confirms expectations of an earlier first interest rate hike and a less gradual interest rate path. The period in time at which survey participants are expecting the first interest rate hike moved forward perceptibly to the fourth

quarter of 2022 according to both rounds of the survey (January round of the SMA: Q3 2023). The further increase in inflationary pressures and new upside surprises in euro area inflation are likely to be the root cause of the adjusted market expectations. Additionally, the more rapid path towards normalisation that other major central banks are taking could play a role. The difference in the timing of the first interest rate hike according to the forward curve and according to the surveys probably stems from two main factors. First, the forward curve still contains positive risk premia. Second, the last SMA was carried out before the April meeting, meaning that survey participants were able to factor in neither the most up-to-date information on inflation developments nor recent public statements by various members of the Governing Council.

The APP holdings recorded on the balance sheet have risen by €81.3 billion since mid-February. On 13 May, the Eurosystem held

*Net purchases under the PEPP discontinued at end of March*

assets totalling €3,235.3 billion as part of the APP (see the box on pp. 25 ff. for a breakdown of the holdings by individual programme). Securities holdings reported under the pandemic emergency purchase programme (PEPP) amounted to €1,701.1 billion on 13 May, up by €42.6 billion. Net purchases under the PEPP were discontinued at the end of March, as planned. The holdings reported under both purchase programmes continue to be influenced by the smoothing over time of reinvestments and by the use of amortised cost accounting.<sup>1</sup>

*Only slight change in excess liquidity*

Excess liquidity has changed only marginally since mid-February on the whole. As this report went to press, its volume stood at €4,570 billion, which corresponds to an increase of around €39.4 billion since mid-February (see the box on pp. 25 ff.). The smaller increase compared with previous periods was due to the significant reduction in net asset purchases. Besides this, no more targeted longer-term refinancing operations (TLTROs) were conducted in the reporting period. Demand for standard operations was very subdued.

## Monetary developments in the euro area

*Monetary growth continued to lose momentum*

The broad monetary aggregate M3 continued to expand considerably in the first quarter of 2022, but lost momentum compared to the sharp growth seen in the preceding quarters. The annual growth rate of M3 thus declined further. At the end of the quarter, it stood at 6.3%, which was only half as much as its pandemic-induced peak at the beginning of 2021. The continued slowdown in monetary growth was due to the scaling back of net asset purchases under the PEPP, which were discontinued in March, as planned. At the same time, lending to the domestic private sector continued to rise substantially in the first quarter, primarily in the form of loans to households for house purchase, but also as loans to non-financial corporations. The anticipated rise in

lending rates was an important driver of the buoyant demand for credit. Credit supply conditions remained favourable, although the banks responding to the Bank Lending Survey (BLS) reported that, for the first time in a year, they had tightened credit standards for loans to enterprises again somewhat in the first quarter.

Among the components of M3, overnight deposits continued to contribute the most to the build-up in the monetary aggregate in the first quarter. However, their growth declined significantly once more compared with the previous quarters. This was mainly because the non-financial corporate sector only built up a small volume of short-term deposits on balance. Although firms were able to push through price increases in many cases, thus increasing their revenue per se, their expenditure on intermediate goods and operating equipment also went up at the same time, not least off the back of the sharp rise in energy import prices. By contrast, despite interest rates showing very little change, households stepped up their accumulation of deposits again somewhat in the reporting quarter, following a very weak previous quarter. This was due, in particular, to increased uncertainty, first stemming from the unpredictable consequences of the Omicron variant of the coronavirus, and later on as a result of Russia's attack on Ukraine. As is often the case in a crisis, the latter also led to a significant rise in the demand for cash.

*Accumulation of overnight deposits tailed off again*

On the counterparts side, monetary growth continued to be driven by lending to domestic non-banks. Lending to the domestic private sector, in particular, continued to rise in the first quarter, with loans to households making the largest contribution (see the lower chart on p. 32). Demand for housing loans, especially, remained dynamic. On balance, despite the recent rise in lending rates, banks recorded large

*Further substantial rise in loans to households for house purchase, ...*

<sup>1</sup> In particular, the difference between the acquisition and redemption value is amortised over the security's residual maturity, treated as part of interest income and measured at amortised cost.

Deutsche Bundesbank

inflows in this credit segment, spread across the majority of euro area countries, in all three months. At the end of March, annual growth in loans for house purchase held steady at 5.4%.

According to the banks responding to the BLS, demand for housing loans was primarily stimulated by the persistently low general level of interest rates. On the supply side, the banks participating in the BLS continued on the path of essentially unchanged credit standards, tightening their standards for loans for house purchase only marginally in the first quarter. This was attributable to conflicting factors. On the one hand, banks reported that borrowers' creditworthiness had declined and that the outlook in the housing market had deteriorated. On the other hand, however, they indicated that banks' liquidity position had improved.

*... credit standards tightened marginally according to BLS*

Despite the containment measures associated with the Omicron wave, banks also recorded perceptible inflows in consumer credit in the reporting quarter. This is consistent with the fact that the banks surveyed in the BLS reported a notable increase in demand for consumer and other loans in the first quarter. The main reasons they gave for this rise were household's greater propensity to purchase and improved consumer confidence. Furthermore, the banks responding to the BLS indicated that they had again marginally eased their credit standards for consumer and other loans. However, credit inflows in this segment ground to a halt in March due to the war in Ukraine and its economic fallout, which dampened consumer confidence and led households to postpone large purchases.

*Perceptible inflows in consumer credit, too*

Banks also recorded substantial inflows of loans to euro area enterprises in the first quarter. One reason for enterprises' buoyant demand for loans is likely to have been to secure comparatively low interest rates in light of an expected tightening of the monetary policy stance. This is consistent with the fact that non-financial corporations mainly sought long-term loans in

Deutsche Bundesbank

the first quarter. In addition, the economic disruption caused by the coronavirus pandemic subsided, which bolstered demand for credit in this segment. The data provided by the banks participating in the BLS suggest that the borrowed funds were used to finance fixed investment and mergers and acquisitions as well as for refinancing.

... even after war broke out in Ukraine

In addition, BLS banks reported higher financing needs by non-financial corporations for inventories and working capital. This is in line with the significant net inflows recorded for short-term loans, especially in March, which are likely to be related to the outbreak of the war in Ukraine. On the one hand, it is possible that enterprises require more funds due to the sharp rise in the already high commodity prices, new massive trade restrictions and the considerable increase in uncertainty. On the other hand, enterprises may have brought forward their lending because banks – as reported in the BLS as well – are planning to tighten their credit supply.

Heterogeneous lending in Member States

The annual growth rate of loans to non-financial corporations, which had risen significantly in the fourth quarter of 2021 due to a one-off effect linked to TLTRO-III,<sup>2</sup> was almost unchanged at 4.2% at the end of March. Looking at the largest Member States, it is striking

that the bulk of lending in the first quarter was borne by banks in Germany and France. By contrast, Italy generated only weak stimulus; in Spain, banks recorded net outflows of loans.

For the first time in a year, the banks surveyed in the BLS tightened their credit standards in corporate lending somewhat at the aggregate level in the first quarter. The main reasons cited by banks were their perceived deterioration in the economic situation and outlook, sector-specific and firm-specific factors, and borrowers' creditworthiness. Banks also reported that their risk tolerance had declined. On balance, the surveyed banks in the euro area are planning to tighten their standards further in the second quarter. This is probably also linked to the feared negative impact of the war on the economy and on credit risk in corporate lending.

BLS banks tightened credit standards in corporate lending

In addition to loans to the private sector, inflows to securities-based lending to general government also boosted monetary growth (see the upper chart on p. 32). That said, they

<sup>2</sup> A reference period for credit growth connected to these operations expired at the end of 2021. This determined whether a bank participating in the TLTRO-III series would receive the particularly favourable special interest rate conditions during the relevant period. For this reason, banks with previously weak lending records were particularly interested in strengthening their lending.

were significantly lower in the quarter under review than in the preceding quarters, as the Eurosystem reduced the monthly net purchases of government bonds under the PEPP as scheduled and discontinued them in March. In April, the Governing Council reaffirmed its expectation that the remaining net purchases under the APP would likewise be discontinued in the third quarter. This counterpart's contribution to monetary growth is therefore likely to decline further over the coming months.

*Declining Eurosystem net purchases dampened inflows to securitised lending*

As in the preceding quarters, the MFI sector's net external asset position continued to have a dampening effect on monetary growth. This was due to the ongoing negative balance of the euro area's financial account with the rest of the world, driven partly by the fact that non-residents continued to sell euro area government bonds on balance. However, as the Governing Council is planning to reduce and eventually discontinue net purchases under the APP, this factor is likely to have less and less of an effect. Furthermore, the typical positive impact of the current account on monetary growth was also much smaller. Though the current account balance remained positive for January and February according to the non-seasonally adjusted figures available so far, the trade balance in particular narrowed significantly on the back of sharp rises in energy prices.

*Net external asset position has further dampening effect on monetary growth*

## German banks' deposit and lending business with domestic customers

German banks' deposit business with domestic customers grew steeply in the first quarter of 2022. This was again driven by strong inflows to overnight deposits, which were broadly based across the money-holding sectors. In addition, however, short-term time deposits were also topped up much more strongly than usual, though these were exclusively the short-term time deposits of general government, which expanded these considerably as a result of high tax revenue. That said, the momentum

*Steep increase in deposit business due primarily to overnight deposits*

behind deposit business dwindled markedly during the quarter as individual money-holding sectors – including households – reduced their overnight deposits again on balance at the end of the first quarter. One reason for this could be the average interest rate on these deposits falling further into negative territory over the course of the quarter (see the adjacent chart). Moreover, the recent significant rise in inflation rates is also likely to have raised households' awareness of the opportunity costs of holding money.

*Substantial rise in deposits of non-financial corporations*

It was also striking that domestic enterprises topped up their overnight deposits substantially, despite the increased opportunity costs. It appears that uncertainty about the economic fallout of the war in Ukraine led enterprises to park freed-up funds and postpone planned investment.

*Lending business with non-banks very dynamic again*

Banks' lending business with domestic non-banks was also very dynamic in the first quarter of 2022. Lending to the domestic private sector, which grew steeply once again, was the main factor in this development. By contrast, lending to the public sector declined markedly for the fourth consecutive quarter in view of the improved budgetary situation, particularly in the case of state and local governments.

*Financing needs of non-financial corporations remain high*

In the case of banks' lending to domestic non-financial corporations, the expected counter-movement to the exceptionally strong growth in lending to this sector in the final quarter of 2021 was largely absent. Instead, firms' demand for both short-term and long-term loans was again high, indicating persistently elevated financing needs on the part of non-financial corporations. Hence, the annual growth rate of loans to non-financial corporations continued to rise and stood at just under 6% at the end of the quarter.

This is consistent with the fact that, as reported by the banks surveyed in the BLS, non-financial corporations' demand for credit continued to increase on the quarter. Once again, the sur-

*Credit demand driven chiefly by higher need for funds for inventories and working capital as well as interest rate hedging motives*

veyed bank managers cited the need for funds for fixed investment as well as for inventories and working capital as the main reasons for this. According to the bank managers, short-term financing needs also increased as a result of firms boosting their inventories in the face of unstable supply chains and the heightened uncertainty caused by the Ukraine war. Furthermore, according to the BLS, the low general level of interest rates again played a greater role in demand growth than in the preceding quarters. The banks surveyed in the BLS also consider interest rate hedging motives, in anticipation of rising interest rates, as a factor in this regard. This could be one reason why long-term loans continued to increase in March, even though, when viewed in isolation, the high degree of uncertainty about the economic fallout of the war dampened enterprises' propensity to invest.

*Lending policy in corporate banking slightly restrictive*

At the same time, the surveyed banks tightened their credit standards for corporate lending slightly on balance, while leaving their credit terms and conditions unchanged on the whole. They justified these stricter standards by pointing to the heightened level of credit risk, chiefly citing sector-specific and firm-specific factors as well as the deterioration of the general economic situation and outlook as explanatory factors.

*Demand for housing loans remains brisk*

Growth in German banks' lending business was also shouldered to a significant extent by loans to households. Crucial for the most recent spell of growth were once again loans for house purchase, which also grew steeply in the first quarter. However, the annual growth rate of loans taken out for house purchase remained virtually unchanged at 7.0% at the end of March.

*Recent marked inflows in consumer credit*

The rise in loans to households was also driven by consumer credit, which recorded marked net inflows in the reporting quarter. Households' demand for bank loans has been boosted by the continued favourable income and asset situation and low financing costs,

### Loans\* by German banks to the domestic non-financial private sector

Deutsche Bundesbank

even though interest rates for individual segments, including loans for house purchase, have risen slightly at the current end.

The data provided by banks participating in the BLS are broadly in line with developments in lending. Banks saw the main reason for the high demand from households in the persistently low general level of interest rates, coupled with the expectation of rising interest rates. In addition, borrowers' belief that the outlook on the real estate market will remain bright and the anticipation of rising real estate prices stimulated demand.

*Demand bolstered by continued favourable financing costs and bright outlook in real estate market*

*Restrictive lending policies for loans to households for house purchase*

In the first quarter, the banks surveyed in the BLS tightened their lending policies for loans to households for house purchase on balance. Housing market prospects, which had deteriorated according to the banks' assessment, were the most commonly cited reason for this tightening. On balance, a decline in borrowers' creditworthiness and a deterioration in the general economic situation and outlook also contributed to the tightening of policies. Furthermore, a reduction in banks' risk tolerance and the restrictive effect of equity costs and funding conditions played a certain role.

*Funding environment deteriorated somewhat for German banks*

In response to the ad hoc questions in the April survey, German banks reported that their funding conditions had deteriorated somewhat compared with the previous quarter.

*Purchase programmes improved banks' liquidity position and funding conditions*

Over the last six months, the Eurosystem's purchase programmes (APP and PEPP) have helped improve the liquidity position of commercial banks and their market funding conditions, but they were still negatively impacting bank profit-

ability through net interest income. The purchase programmes did not contribute to credit growth over the past six months.

The negative interest rate on the deposit facility depressed lending and deposit rates and pushed up fees for deposits. Overall, it once again squeezed banks' net interest income. The two-tier system for remunerating excess liquidity holdings did, however, soften the adverse impact on profitability.

Ten out of 33 banks from the German BLS sample took part in the TLTRO-III operation in December 2021, mainly on account of the attractive design. Banks reported using the obtained funds primarily for lending and as a substitute for maturing debt securities and interbank loans. According to the banks participating in the survey, the TLTRO-III operations had an easing impact on their lending policies and contributed to a rise in lending, particularly to enterprises.

*Two-tier system for excess liquidity supports profitability*

*TLTRO-III funds used for lending and substituting liabilities*

## ■ Financial markets

### ■ Financial market setting

*Financial markets price rising inflation rates and less accommodative monetary policy into valuations*

Mounting inflation concerns and the war against Ukraine shaped developments in global financial markets in recent weeks. Given higher inflation rates and expectations, bond market yields rose markedly worldwide, also against the backdrop of key central banks pushing to recalibrate monetary policy. For example, the UK and US central banks further tightened their monetary policy stance by repeatedly raising their policy rates.<sup>1</sup> In addition, the Federal Reserve announced that, starting in June 2022, it would reduce its securities holdings purchased under monetary policy purchase programmes. The Bank of Japan, by contrast, pledged to stick to its yield curve control policy. The war against Ukraine added to the inflation concerns that had already been worrying market participants, not least on account of the considerably higher energy prices, and ultimately also stoked expectations of a faster adjustment of the monetary policy stance. Moreover, the war increased uncertainty surrounding the economic outlook. This culminated in growing financial market volatility and a sharp but brief slump in stock prices. Significantly stronger headwinds on the stock exchanges came from the higher interest rate level. Overall, European and US stocks have declined substantially in value in the year to date. In foreign exchange markets, the feared economic consequences of the war and expectations concerning differences in the pace of monetary policy adjustment in the major currency areas pushed down the euro's exchange rate.

### ■ Exchange rates

*On balance, euro suffers significant exchange rate losses against US dollar, ...*

While the euro had fluctuated around the US\$1.13 mark at the start of the year without showing any clear trend, this changed abruptly with the Russian invasion of Ukraine. First, price volatility in the foreign exchange markets in-

creased markedly. Second, the currencies of countries in relatively close geographical proximity to the war or that have relatively close trade links with Russia, e.g. due to importing energy sources such as oil and gas, tended to come under downward pressure. The euro also depreciated significantly against the US dollar because it was expected that the economic impact of the war and the sanctions imposed against and on the table for the Russian Federation would hit the euro area harder than they would the United States. At the same time, the US dollar benefited from its status as a safe haven currency.

The euro's exchange rate stabilised temporarily in March. This was supported by signals from ECB representatives to possibly raise key interest rates earlier than expected. Moreover, the euro benefited from vague hopes of a negotiated solution in the war against Ukraine. However, the monetary policy decisions made by the ECB Governing Council in March did not have a lasting impact on the euro/US dollar exchange rate; although the prospect of concluding asset purchases in the third quarter was raised, it was left open as to when there might be a key interest rate turnaround in the euro area.

In April, signals from the Federal Reserve that it planned to accelerate the monetary policy normalisation process in the United States led once again to considerable exchange rate losses for the euro. As a result of the associated speculation about a growing divergence in monetary policy stances on both sides of the Atlantic, the euro fell to a five-year low of less than US\$1.04, but stabilised again more recently. As this report went to press, the euro stood at US\$1.05. It has thus depreciated by 7.1% against the US currency since the end of December 2021.

---

<sup>1</sup> For information on the ECB Governing Council's measures, see p. 24.

*... but appreciates slightly against pound sterling ...*

Despite four policy rate hikes in the United Kingdom since December of last year, the euro recorded slight net gains against the pound sterling. These were largely the result of the market reaction to the Bank of England's latest monetary policy meeting. As expected, it decided to raise its base rate (Bank Rate) to 1%. At the same time, however, it pointed to a medium-term decline in the inflation rate resulting from the economic downturn, which, according to its forecast, is likely to be greater than expected by market participants. In their view, this, in turn, has increased the likelihood of a less steep interest rate path, which put pressure on the pound sterling. Recently, how-

ever, the publication of robust labour market data for the United Kingdom again resulted in a countermovement. As this report went to press, the euro was trading at £0.85, around 0.8% higher than at the end of December.

On balance, the yen has depreciated markedly across the board since the start of the year, although it temporarily benefited from the high degree of uncertainty in the financial markets. For a time, the euro recorded a five-year high against the yen, while the US dollar even hit a 20-year high. One key reason for the yen's losses was the Bank of Japan's renewed commitment in March to maintaining its ultra-loose monetary policy stance in view of lower domestic inflation rates rather than following in the footsteps of other central banks and changing its monetary policy course. As a result of the widening interest rate differential between the yen and other major currencies, the yen became even more attractive as a funding currency for carry trades, which generally reduced its value.<sup>2</sup> As this report went to press, the euro was trading at ¥134. It was thus some 3.1% above its value at the end of December.

*... and markedly against yen*

Measured as a weighted average against the currencies of 19 major trading partners, the euro has depreciated by 1.6% net since the end of December. Losses were recorded against the US dollar and the currencies of numerous commodity-exporting countries, which benefited from higher commodity prices. This contrasted with gains against the yen, the pound sterling and the currencies of some central and eastern European countries that are even more directly affected by the war in Ukraine than the euro area. On balance, the price competitiveness of euro area suppliers improved over the period under review, but looking at the long-term average, their competitive position can still be considered neutral.

*Euro down in effective terms*

<sup>2</sup> See Deutsche Bundesbank (2014).

## Securities markets and portfolio investment

### Bond market

*Ten-year government bond yields up globally*

Nominal government bond yields have risen very significantly in the major currency areas since the start of the year. This was the government bond markets' response to rising inflation figures, market participants' higher inflation expectations and the prospect of a less expansionary monetary policy stance. Yields on international benchmark bonds fell temporarily when the war first broke out in Ukraine owing to higher demand for safe haven assets. However, given the rising inflation figures worldwide, they quickly resumed their upward trend. The Federal Reserve contributed to higher yields, particularly in the US bond market, as it repeatedly responded to inflationary pressures with monetary policy tightening measures. In view of this, yields on ten-year US Treasuries increased especially significantly, rising by 135 basis points to 2.9%. Analyses of the US Treasury yield curve show that market participants expect a significantly steeper interest rate path over the next two years, too, than they did at the start of the year. In addition, higher term premia – the amount investors demand as compensation for assuming interest rate risk when purchasing long-term bonds – also contributed to the increase in US Treasury yields. Real term premia, which can also reflect increased cyclical risks, are currently the dominant yield component.

*Government bond yields up significantly in United Kingdom and slightly in Japan*

In the United Kingdom, the yields on ten-year gilts rose by 90 basis points to 1.9%. The Bank of England continued to tighten its monetary policy in view of persistently high inflation rates. By contrast, the Bank of Japan continued to maintain its strongly accommodative monetary policy stance and its ten-year government bond yield target of close to 0%, countering the international interest rate trend. It announced in February that it would aim to keep yields at no more than 0.25% by offering unlimited bond buying. The yield on ten-year

## Holder structure and free float of Federal securities

The market for Federal securities plays a key role in the international bond market. Thanks to their high credit quality and liquidity, German government bonds have become an important benchmark for the prices of other financial market instruments in the euro area and shape the euro area's spot and futures markets. Federal securities typically have a very broad investor base. Demand for German government bonds comes from a wide range of sectors in Germany as well as other countries, both inside and outside Europe. In this context, Federal securities play an essential role in the reserve assets of foreign central banks.

In March 2015, for monetary policy reasons, the Eurosystem began to buy Federal securities in the secondary market as part of the public sector purchase programme (PSPP). This caused the established holder structure to shift in favour of the Eurosystem. Up to the beginning of 2020, these shifts were relatively strong, as the Federal Government's net issuance was close to zero during this period. In net terms, the increase in the Eurosystem's holdings therefore led to a corresponding decrease in the holdings of other investors.

Given the much gloomier economic outlook and the feared risks to price stability following the outbreak of the coronavirus pandemic, in March 2020 the Governing Council of the European Central Bank (ECB) approved an additional purchase programme – the pandemic emergency purchase programme (PEPP), which likewise included government debt securities. In the second quarter of 2020, the German Federal Government also adopted extensive fiscal measures which were largely financed through the capital market. Since the beginning of the pandemic, on balance, central government's net issuance has ex-

ceeded the Eurosystem's net purchase volumes of Federal securities.

This box illustrates the changes in the holder structure of Federal securities.<sup>1</sup> To this end, we compare the current figures on holder structure (December 2021) with the data from prior to the launch of the PSPP (December 2014) and from before the outbreak of the coronavirus pandemic (December 2019). It becomes clear that the holder structure has shifted considerably under the purchase programmes. The stock of freely tradable bonds, the free float, initially fell both in absolute terms as well as in relation to the outstanding volume. This has changed since the outbreak of the pandemic. While in relative terms, the free float continued to fall steadily to almost 30% at the end of the period under review, in absolute terms it initially rose again and has hovered at just over €500 billion since then.

### Reference dataset

The holder structure of Federal securities can be examined in detail on the basis of the European Securities Holdings Statistics by Sector (SHSS), which are collected in the Eurosystem.<sup>2</sup> The SHSS capture both the proprietary and customer securities holdings of all reporting account-keeping institutions in the euro area. The SHSS do not include the holdings of the ECB or the euro area national central banks. Combined with the Bundesbank's holdings, which can be extracted from the Bank's internal accounts, just over 97% of the total outstanding volume of Federal securities was captured at the end of 2021 and assigned to the sector and country of the respective holder ac-

<sup>1</sup> For more information on the holder structure of Federal securities, see also Deutsche Bundesbank (2018).

Deutsche Bundesbank

ording to the reporting template.<sup>3</sup> On the basis of changes in holdings as shown in the SHSS, it is possible to deduce which investor groups were net buyers or sellers in the market.<sup>4</sup>

#### Holder structure

Under the PSPP, the Bundesbank built up holdings of Federal securities of just under €280 billion by the end of 2019. The ongoing and additional purchases under the PEPP saw these holdings rise to just under €560 billion by the end of 2021, which is roughly equivalent to 34% of the total outstanding volume. As the Eurosystem only makes purchases in the secondary market, the question arises as to who was the net seller in the market.<sup>5</sup>

The SHSS data show that, since the end of 2014, investors from non-euro area countries have scaled back their holdings of Federal securities by €48 billion to just over €620 billion. This represents a decline of just under 19 percentage points in the respective outstanding volume to 37.5%.<sup>6</sup> Private investors from the United States and

<sup>3</sup> The calculations are based on all outstanding Federal securities, ranging from six and twelve-month treasury discount paper (Bubills) to 30-year Federal bonds (Bunds). The Finance Agency's own holdings are also included.

<sup>4</sup> Because the calculations are based on changes in holdings, the terms "purchases" and "sales" are always taken to include the redemptions of maturing Federal securities.

<sup>5</sup> For more information about the structure of the monetary policy purchase programmes, see <https://www.bundesbank.de/en/tasks/monetary-policy/outright-transactions/outright-transactions-626094>.

<sup>6</sup> The dominant role played by sellers from non-euro area countries is also reflected in aggregate PSPP purchases. For more information, see Kojen et al. (2021).

the United Kingdom sold just under €60 billion worth of Federal securities, which equates to a 9 percentage point decline in the share of the total outstanding volume. The sellers were probably mainly financial sector players whose decision to sell may have been chiefly driven by the low yields on Federal bonds.<sup>7</sup> By contrast, China's public sector (central bank and general government) acted as a net buyer, purchasing just under €50 billion in Federal securities in total. However, owing to the higher total outstanding volume, this represents a slight percentage decline in the share to just under 13% at the end of the period under review. It is noteworthy that China's public sector was a net seller in the market when the PSPP was launched, but upped its holdings again after 2019.<sup>8</sup> Unlike for private investors, currency policy considerations, above all, are likely to have played a key role here.

Since the end of 2014, private investors from the euro area have reduced their holdings of Federal securities by €21 billion. Measured in terms of the total outstanding volume, this decline comes to around 8 percentage points. Within the sector, financial investors constituted the largest investor group.<sup>9</sup> Investment funds and euro area banks as a whole reduced their holdings by €41.5 billion, or just over 6.5 percentage points in terms of the share of outstanding volume. It is striking that banks almost completely dissolved their holdings. In the euro area excluding Germany, they even recently built up a small net short position on aggregate. As is the case for private investors from non-euro area countries, this may have been largely driven by developments in German government bond yields. Moreover, euro area banks have access to the deposit facility, which can be a cheaper safe alternative to Federal securities and is not open to other investors. Euro area insurance corporations and pension funds are another major investor group. Unlike other financial investors, they temporarily in-

creased their holdings of Federal securities, probably not least in connection with regulatory requirements. On balance, at just under 7.5% (€124 billion), the share of the outstanding volume of Federal bonds held by insurance corporations and pension funds from Germany and the rest of the euro area has remained virtually unchanged since the end of 2014. Recently, insurance corporations and pension funds surpassed even investment funds as the largest investor group among financial investors.

### Free float

Free float normally refers to the holdings of an issuance that are freely available for trading. It is different to the stock held by investors that purchase bonds and then hold them to maturity. These "buy and hold" investors include, for example, central banks, insurance corporations and pension funds. A large volume of bonds in free float facilitates tradability and allows new, relevant information to be priced in under competitive conditions. The size of the free float can be stated both in absolute amounts and as a percentage of the total outstanding volume.

Although there is no uniform definition of the free float, based on the available data, it can be approximated for the purpose of this analysis using the sum of the private sector holdings excluding insurance corporations and pension funds.

---

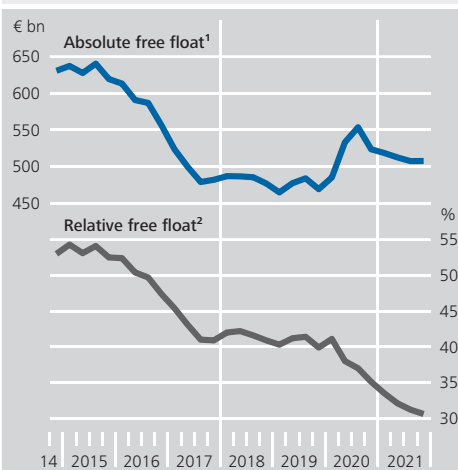

<sup>7</sup> The financial centres of London and New York, where many institutional investors that hold German securities on behalf of clients are resident, also have a bearing on the figures for the United Kingdom and United States. In these cases, the SHSS data shed no light on the end investor. The SHSS data for non-euro area countries cannot be broken down in more detail, for example by financial and non-financial investors.

<sup>8</sup> See also Deutsche Bundesbank (2017).

<sup>9</sup> This more detailed sectoral breakdown is available only for euro area investors (see the table on p. 41). Investors from non-euro area countries can only be broken down into public sector (central bank and general government) and non-public sector.

Under the PSPP, the stock of freely tradable Federal securities declined in both absolute and percentage terms up to the end of 2019, falling by just over €160 billion to just under €470 billion, or by just over 13 percentage points to just under 40%. This changed after the outbreak of the pandemic. As a result of the higher net issuance stemming from the fiscal measures and the monetary policy measures taken, the free float has developed differently in percentage and absolute terms since the second quarter of 2020. The Federal Government's strong issuance activity during the pandemic exceeded the Eurosystem's purchases of German government bonds. This caused the percentage share of the free float to decline further to around 30% at the end of the period under review. However, at the same time, the absolute volume in free float rose slightly by just over €38 billion to a little more than €500 billion.

Federal securities in free float\*

Securities issued by FMS Wertpapiermanagement and central government's off-budget entities are not included. **1** Total private sector holdings, excluding insurance corporations and pension funds. It is assumed that the outstanding volume of securities not captured by the SHSS can be divided equally between those in free float and those held by strategic investors. This assumption is based on the figures prior to the launch of the PSPP, when approximately half of the outstanding volume was in free float. **2** Free float in relation to the total outstanding volume of securities, including the Finance Agency's own holdings.  
 Deutsche Bundesbank

Japanese bonds therefore rose comparatively moderately by 17 basis points to 0.24%, which corresponds to the upper end of the target range. The spread between Japanese bonds and ten-year Federal bonds (Bunds) has increased significantly to a level not seen since 2014, while their spread over US Treasuries is at a three-year high.

participants expected higher short-term interest rates, especially in the short to medium term, in view of constantly rising inflation rates.

The yield curve derived from the yields of Federal securities shifted significantly upwards and became steeper during the period under review. As this report went to press, short-dated bonds also started yielding more than the deposit facility rate of -0.5%. From the two-year maturity category onwards, the yield curve was positive. At the end of 2021, the only bonds to generate positive yields had been those with residual maturities of more than 20 years. At last count, the yield spread between Federal securities and maturity-matched bonds issued by the Kreditanstalt für Wiederaufbau (KfW) was wider than at the end of last year (+20 basis points to 0.7 percentage point). The premium paid by market participants for the particularly high liquidity of Federal securities has therefore increased since the start of the year. Given the repricing of bonds in an environment

*German yield curve shifted significantly upwards and became steeper*

*Higher ten-year Federal securities yield due to increased short-term interest rate expectations and higher term premia*

Yields on ten-year Bunds also rose significantly during the reporting period (1.0%, +113 basis points). They returned to positive levels in January for the first time since mid-2019. Such a steep rise in interest rates had last been observed in the spring of 2015, when the ten-year yield on Federal securities rose by around one percentage point in the span of a few weeks (the Bund tantrum). A model breakdown of the yield curve of Federal securities shows that two factors contributed to the rise in yields. First, term premia increased. To some extent, this is likely to be a consequence of lower net asset purchases by the Eurosystem. Second, market

in monetary policy stance, the relative prices of bonds with different ratings will also return to normal. Changes in the yield spreads of the other euro area Member States were not uniform, but instead reflected different country-specific risks. For example, the yield spreads of countries with a poorer rating widened somewhat disproportionately overall. In particular, the yield spread of Greek government bonds, which, with a Standard & Poor's rating of BB+, are not classified as investment grade, widened significantly (+108 basis points). However, it remained slightly below its five-year average. Market liquidity indicators did not point to any pronounced tightness in the market for euro area government bonds during the period under review.

At the end of the reporting period, market-based short-term inflation expectations for the euro area derived from inflation swaps were well above the 2% definition of price stability over a two-year horizon, peaking at over 8% for September 2022. At the end of 2021, inflation swaps had still been indicating that inflation would rapidly fall back to 2% from a high level by the end of this year. With the recent increase, the profile of market-based indicators of inflation expectations for the next two years shifted very significantly upwards. This process started with the publication of surprisingly high inflation figures at the beginning of the year and intensified with the outbreak of the war against Ukraine (see also p. 22). The expected inflation rates for 2023 increased particularly sharply. However, inflation expectations have also risen in the medium term since the beginning of the year. Inflation swaps recently recorded an inflation rate in excess of 2.5% for April 2024, the last month for which detailed information is currently available.<sup>4</sup> On an an-

*Market participants expected higher inflation rates in the medium term*

of higher inflation rates, the volatility of Federal securities yields also increased. As a result, the implied volatility of options on futures contracts for Bunds was above its five-year average.

*Widening of yield spreads in euro area*

The yield spread between ten-year Bunds and ten-year government bonds of other euro area countries (GDP-weighted average) widened compared with the start of the year by 32 basis points to 1.0 percentage point. Even after the scheduled conclusion of net asset purchases under the pandemic emergency purchase programme (PEPP), the yield spread remained only moderately above the five-year average (0.8 percentage point). The five-year window fully covers a period during which the Eurosystem was active in bond markets.<sup>3</sup> In this environment of generally low interest rates, private investors were more willing to purchase bonds with lower ratings in order to obtain a somewhat higher interest rate ("search for yield"). The current widening of the spread reflected the fact that, in the wake of the expected shift

<sup>3</sup> Between January 2019 and October 2019, the Eurosystem did not make any net purchases under the asset purchase programme (APP) but fully reinvested the principal payments from maturing securities.

<sup>4</sup> Detailed inflation swaps are available at monthly horizon intervals for the next 24 monthly data releases. In addition, there are inflation swaps with less granular annual maturity intervals up to a ten-year horizon.

nual average, market participants expected a rate of 7.7% for 2022 and 4.6% for 2023. A period in which high inflation expectations become entrenched increases the risk that households and enterprises will align their wage and price-setting decisions with inflation expectations that are above the 2% inflation target.

*Survey and market-based inflation expectations differ due to risk premia*

Market-based inflation expectations were also considerably above survey expectations and markedly above the March ECB staff projections. Methodological and economic factors can cause market and survey-based inflation expectations to diverge. The positive inflation risk premium reflected in the difference between market and survey-based values suggests, for instance, that market participants are hedging against risks arising from unexpectedly high inflation in the future. In their assessment, they also take into account war-related scenarios which can have serious implications for energy price movements. Market participants who assume the risk of insuring others against high inflation in risky situations charge a premium, which means that, in addition to the probability of high inflation occurring in swap rates, the risk itself is also priced in.

*Significantly greater rise in long-term forward inflation rates in the euro area*

Market participants also expected markedly higher inflation rates in the long term. At 2.3% at last count, the five-year forward inflation rate five years ahead, which is likewise derived from inflation swaps, was 30 basis points higher than at the beginning of the year and 53 basis points higher than before the Russian invasion of Ukraine. On the other hand, survey-based inflation expectations calculated by Consensus Economics for the euro area six to ten years ahead fell slightly in April to 1.9%, compared with 2.0% in January 2022. As with the above-mentioned short-term inflation expectations derived from inflation swaps, risk premia are likely to have additionally contributed to the sharp rise in long-term market-based indicators.

Deutsche Bundesbank

years have risen significantly since the beginning of the year. Given that the yields on matched-maturity Federal securities rose less sharply on balance, the spreads of BBB-rated European financial and non-financial corporate bonds over Bunds widened by 131 and 89 basis points, respectively. Yields and risk premia on high-yield bonds rose particularly sharply. At the same time, the credit default premia for debtors with poor creditworthiness increased (iTraxx Crossover (five years), +235 basis points). The majority of this increase already took place prior to the invasion of Ukraine by the Russian Federation. Measured by yield spreads, funding conditions for European enterprises in the capital market were hovering at just over ½ percentage point above their five-year average as this report went to press.

Gross issuance in the German bond market in the first quarter of 2022 was significantly higher than in the preceding three-month period. Overall, German issuers placed €433½ billion

Deutsche Bundesbank

worth of debt securities in the market, up from €354 billion in the previous three months. Net of redemptions and changes in issuers' own holdings, residents ramped up their capital market borrowing by €87½ billion. The outstanding volume of foreign debt securities in the German market rose by €48½ billion in the

first quarter. On balance, the total outstanding volume of bonds in Germany thus grew by €136 billion in the quarter under review.

Domestic credit institutions increased their capital market debt by €43½ billion on balance between January and March, compared with net redemptions of €4 billion in the previous quarter. The primary instruments issued were debt securities of specialised credit institutions (€33 billion), followed to a lesser extent by mortgage Pfandbriefe (€5 billion) and other bank debt securities that can be structured flexibly (€4 billion).

*Rise in credit institutions' capital market debt*

In the first quarter of 2022, the public sector issued bonds to the tune of €26 billion net, following €21½ billion in the previous three-month period. The Federal Government (including the resolution agency classified as part of central government) issued mainly 30-year Federal bonds (Bunds) and five-year Federal notes (Bobls) (€16 billion and €14 billion respectively). This contrasted with net redemptions of Treasury discount paper (Bubills) amounting to €13½ billion. State and local governments issued bonds worth €3 billion net.

*Net public sector issuance*

In the quarter under review, domestic enterprises were highly active in the corporate bond market, issuing a net €17½ billion worth of bonds. Their net redemptions equalled €8 billion a quarter earlier. The bulk of these issues was attributable to non-financial corporations (€11 billion).

*Net issuance of corporate bonds*

All groups of investors acquired debt securities in the first quarter of 2022, with domestic non-banks expanding their bond portfolios by a net €51 billion, in particular. Foreign debt securities were the instrument of choice (€36 billion). The Bundesbank acquired bonds in the amount of €40½ billion net, predominantly under the Eurosystem's asset purchase programmes. The majority of these purchases involved domestic paper issued by public sector entities. Foreign investors, meanwhile, acquired a net €32½ bil-

*Purchases of debt securities*

lion worth of German debt securities. Domestic credit institutions likewise expanded their bond portfolio, by €12 billion in net terms. On balance, their interest focused exclusively on foreign debt securities.

## Equity market

*International equity markets with losses*

International equity market prices have declined markedly since the beginning of the year. The rise in long-term interest rates in many countries was the decisive factor. They weighed on prices throughout the reporting period via the discount factor effect. Recently, concerns about economic developments have also arisen, not least as a result of lockdowns in China due to the zero-COVID policy being pursued there. Russia's invasion of Ukraine also led to abrupt, albeit mostly short-lived, price losses in global equity markets. Relatively speaking, the stock exchanges in Europe were affected the most in the period immediately after the start of the war. This reflected the fact that the economies of those countries in closer proximity to Russia and Ukraine are usually also more closely intertwined with these countries. This also applies to Germany, whose economy had been heavily dependent on Russian commodities up until the start of the war. As a reflection of the slump in prices, uncertainty in the equity markets temporarily spiked after the start of the war. However, as uncertainty declined, prices picked up again somewhat. Toward the end of the reporting period, the regionally differentiated price pattern largely disappeared. On balance, the US S&P500 (-18.2%), the Euro Stoxx (-14.7%) and the CDAX (-17.3%) have each recorded significant losses since the beginning of the year. The Japanese Nikkei's losses were more moderate (-8.3%). In the United Kingdom, markets closed at the end of the period under review down only slightly from the beginning of the year (FTSE 100: -1.1%). One reason for this better performance is that the FTSE index contains a large contingent of enterprises that benefited from the high price gains in the commodity sector.

## Do financial sanctions against Russian banks affect payments? Evidence from the German TARGET2 component

Russia's annexation of the Crimean peninsula in March 2014 prompted the European Union (EU) to impose financial sanctions on Russia for the first time. In mid-2014, it adopted targeted measures not only against individuals but also against specific Russian credit institutions. Following the Russian invasion of Ukraine on 24 February 2022, the European Union tightened and expanded the sanctions. Many other countries also adopted sanctions against Russia or extended existing restrictions.

This study uses transaction data from the German TARGET2 component (TARGET2-Bundesbank) between 1 February 2022 and 30 April 2022 to assess whether financial sanctions against Russian credit institutions which have been newly implemented or tightened since the end of February 2022 actually reduced financial flows in the German TARGET2 component and whether the various types of sanctions had different effects.<sup>1</sup> The analysis is based exclusively on data from the Bundesbank's TARGET2 component system and focuses only on the "customer payments" and "interbank payments" transaction categories,<sup>2,3</sup> not taking into account third-party data. The advantage of the TARGET2 data used is that they are available on a daily basis. Furthermore, the effect of the sanctions can be cleanly identified econometrically, as the dataset contains accounts of both sanctioned and non-sanctioned Russian banks. However, a caveat is in order: the study only covers a subset of all payments to and from Russia, as other payment channels and TARGET2 component systems are not taken into account.<sup>4</sup> Moreover, it includes only those transactions from TARGET2-Bundesbank initiated by Russian banks via correspondent

banks in the EU in TARGET2 or TARGET2 payments intended for Russian banks. This is why further studies are needed, especially given the possibility of circumvention and also incorporating additional data sources, in order to draw general conclusions on the impact of financial sanctions on financial flows.

The study distinguishes between three different types of financial sanctions against Russian banks. These are capital market sanctions, SWIFT exclusion<sup>5</sup> and prohibitions on disposal (see the table on p. 49).

Nine Russian banks are subject to capital market sanctions (column 1).<sup>6</sup> This means that EU market participants are prohibited from directly or indirectly purchasing, selling, providing investment services for or as-

**1** TARGET2 (Trans-European Automated Real-time Gross settlement Express Transfer system) is a Eurosystem payment system for the fast and secure settlement of individual electronic payments within the European Union. TARGET2 is based on a single shared platform (SSP) and guarantees the rapid exchange of central bank liquidity in real time.

**2** Only payments processed via the German TARGET2 component are taken into account. Payments from Russia initiated, for example, via an Austrian bank in TARGET2 and intended, say, for a recipient in France are not included. This therefore represents only a subset of all TARGET2 business activities.

**3** These two transaction categories make up around 95% of the total number of observations. In terms of value, they comprise around 60% of the recorded capital flows. Credit institutions' intra-group payments account for the majority of the other transactions in TARGET2-Bundesbank.

**4** Important Russian participants are also included, for example, in the Austrian and French TARGET2 components. In addition to their TARGET2 business activities, Russian credit institutions also use other payment systems to settle their payments.

**5** The Society for Worldwide Interbank Financial Telecommunication (SWIFT) operates a particularly secure telecommunications network which is used by banks worldwide to settle financial transactions.

**6** The capital market measures also apply to the subsidiaries of the aforementioned credit institutions domiciled outside the EU.

sistance in the issuance of, or otherwise dealing with transferable securities and money market instruments issued by the sanctioned institutions. As a result, these Russian banks are no longer able to refinance themselves in the EU via capital market instruments (depending on the limitation of maturity via bonds or money market instruments). Seen in isolation, these types of financial sanctions are likely to be, relatively speaking, the softest type of instrument, as other forms of borrowing are still possible.<sup>7</sup> Furthermore, this measure does not address payment transactions, which means that payments may continue to be made. In addition, the nine Russian banks affected – at least under these EU regulations – are not prevented from buying or selling, on behalf of their customers, securities issued by other entities.<sup>8</sup>

The SWIFT exclusion (column 2) is governed by Council Regulation (EU) 2022/345: “It shall be prohibited as of 12 March 2022 to

provide specialised financial messaging services, which are used to exchange financial data, to the legal persons, entities or bodies listed in Annex XIV or to any legal person, entity or body established in Russia whose proprietary rights are directly or indirectly owned for more than 50% by an entity listed in Annex XIV.” The organisations listed in said Annex include seven Russian banks. This type of financial sanction has considerably more bite than capital market sanctions. Nevertheless, the affected Russian institutions can continue to make international credit transfers via alternative payment systems, such as the Chinese Cross-Border Interbank Payment System (CIPS), or other secure communication channels, such as secure fax lines. As standardised messa-

<sup>7</sup> Article 5 of Council Regulation (EU) No 833/2014 also prohibits lending to certain Russian credit institutions.

<sup>8</sup> However, since 26 February 2022, general restrictions on some Russian enterprises have also been in force in the securities sector (Articles 5e and 5f of Regulation (EU) No 833/2014).

ging via SWIFT is no longer possible, the number and volume of transactions are likely to decline considerably in practice.

Eight Russian banks are subject to prohibitions on disposal (column 3). All funds and economic resources belonging to, owned, held or controlled by any natural or legal persons, entities or bodies, or natural or legal persons, entities or bodies associated with them shall be frozen. No funds or economic resources shall be made available, directly or indirectly, to or for the benefit of the parties concerned. This type of financial sanction is likely to be toughest of the three types discussed here, as these measures directly affect payments.<sup>9,10</sup>

As mentioned above, this study is confined to TARGET2-Bundesbank transaction data. This includes payments initiated by Russian banks via correspondent banks in the EU in TARGET2-Bundesbank or intended for Russian banks – where apparent based on available information.<sup>11</sup>

All in all, the dataset comprises business-day transactions for 518 Russian institutions with a unique business identifier code (BIC) and 62 TARGET2 business days. 163 BICs are subject to capital market sanctions, 50 BICs to SWIFT exclusion and 50 BICs to a prohibition on disposal.<sup>12</sup> As different types of sanctions have been imposed on several Russian banks, there is overlap between the affected BICs.

The upper section of the chart on p. 51 describes the business-day aggregated inflows and outflows in TARGET2-Bundesbank via the accounts of non-sanctioned and sanctioned Russian banks from column (1) between 1 February 2022 and 30 April 2022 (capital market sanctions). Up to and including 24 February 2022, the business-day average of inflows to (outflows from) non-

sanctioned bank accounts stood at €1.5 billion (€1.1 billion). The business-day average of inflows (outflows) subsequently fell to €0.7 billion (€0.7 billion). Capital flows into and out of the accounts of sanctioned banks also decreased. Up to and including 24 February 2022, the business-day average value of inflows (outflows) amounted to €1.6 billion (€1.8 billion). Inflows (outflows) subsequently dropped to €221 million (€291 million). In the course of April, the financial flows of both groups went back up in some cases.

The middle section of the chart on p. 51 illustrates the capital flows in TARGET2-Bundesbank via the bank accounts of the seven Russian banks excluded from SWIFT. The pattern of gross flows to or from the accounts of non-sanctioned Russian banks is very similar to that under capital market sanctions. It is striking that transactions plummeted following the Russian invasion of Ukraine on 24 February 2022. Since the decision to exclude several Russian banks from SWIFT on 1 March 2022, the aggregate daily transactions of the sanctioned bank accounts have been close to zero.

The lower section of the chart on p. 51 illustrates the capital flows of non-sanctioned and sanctioned Russian banks in the event of a prohibition on disposal. These types of sanctions also include restrictions on pay-

<sup>9</sup> In the past, prohibitions on disposal have often been imposed on certain individuals in sanctioned countries.

<sup>10</sup> Depending on the business activity of the Russian bank, in specific cases a SWIFT exclusion may also have a stronger impact than a prohibition on disposal.

<sup>11</sup> It is not always mandatory to populate the message fields in SWIFT. There are strong signs of an increase in “free format” messages, where the field is populated but not with an automatically identifiable BIC. In the TARGET2 transaction data, the corresponding field is then empty. The assumption is that Russian institutions are trying to conceal their transactions.

<sup>12</sup> As a rule, a single credit institution has several BICs. Therefore, the number of BICs is greater than the number of sanctioned Russian banks.

ments. The pattern of gross flows to or from the accounts of the non-sanctioned Russian banks is once again very similar. Since the prohibition on disposal went into effect on 23 February 2022, capital flows to or from the accounts of sanctioned banks have likewise been close to zero. However, even immediately before the prohibition on disposal, the average daily gross flows to and from sanctioned banks were at a low level: €53 million in inflows to Russian bank accounts and €93 million in outflows from Russian bank accounts (from 1 February to 22 February 2022).

The descriptive statistics indicate that capital flows to and from both the accounts of non-sanctioned banks and the accounts of sanctioned banks fell sharply following the introduction or tightening of strict measures against Russian banks. The effect on the accounts of sanctioned banks was more severe in the case of SWIFT exclusion and prohibition on disposals than in the case of capital market sanctions.

However, the descriptive analysis does not take into account general macroeconomic developments or across-the-board reluctance to engage in transactions as a result

of the war, both of which affect all Russian banks equally. The econometric analysis below therefore incorporates additional effects, such as the withdrawal of multinational enterprises from Russia, which is also likely to have had a negative impact on payments. In addition, the study takes into account potential interdependencies when Russian banks are affected by multiple sanctions.

In order to assess the effect of financial sanctions on Russian banks, the study uses a difference-in-differences estimator. This method attempts to identify a causal effect. For this purpose, a group experiencing a certain intervention (“treatment”, here: accounts of sanctioned Russian banks) is compared with a control group (accounts of non-sanctioned Russian banks). Since the beginning of the war can be interpreted as an exogenous event that leads to the introduction or tightening of sanctions, a “treatment” exists in the subsequent period. Russian bank accounts that make payments via TARGET2-Bundesbank but are not subject to sanctions serve as a control group. Only the effects on sanctioned banks that go beyond general developments are of interest. Data gaps are filled with nil values in order to create a balanced panel. In the following, equation (1) is estimated using the Pseudo-Poisson Maximum Likelihood (PPML) estimator in order to account for non-linear effects:

$$(1) \text{Capital flows}_{bt} = \alpha + \exp[\beta \text{Sanctions}_{bt} + \gamma \text{Anticipation}_{bt}] + \pi_b + \sigma_t + \varepsilon_{bt}$$

where *Capital flows*<sub>bt</sub> represents the respective gross flow (inflows/outflows) of the Russian account *b* (identified using the BIC) on day *t* as part of the German TARGET2 component. *Sanctions*<sub>bt</sub> is a binary variable that assumes the value of 1 if

the Russian account *b* is affected by EU financial sanctions on day *t*. A negative estimation coefficient of  $\beta$  is to be expected. The three different types of financial sanctions from the table on p. 53 (capital market sanctions, SWIFT exclusion and prohibitions on disposal) serve as the basis for the sanctioned BICs. The value of *Sanctions*<sub>bt</sub> corresponds to the value of 1 for the affected BIC *b* as from the first day on which the first sanction was imposed on the respective bank.<sup>13</sup> In the case of the SWIFT exclusion, the binary variable *Sanctions*<sub>bt</sub> assumes the value of 1 as of 14 March 2022. However, as the SWIFT exclusion was already announced on 1 March 2022, the estimation also incorporates an anticipation effect into the corresponding regression. The variable *Anticipation*<sub>bt</sub> assumes the value of 1 between 1 March 2022 and 11 March 2022.  $\pi_b$  and  $\sigma_t$  denote bank-specific and time-specific fixed effects. As only Russian accounts are examined, the time-specific fixed effects reflect Russia’s general macroeconomic developments. This environment is likely to affect all Russian accounts simultaneously and in a similar way. The bank-specific fixed effects are designed to control for general business relationships that do not change over time.  $\varepsilon_{bt}$  is the statistical error term.

A baseline specification does not distinguish between the different types of sanctions: the sanction variable assumes the value of 1 once a sanction on the respective Russian bank has been imposed, irrespective of whether it is a capital market sanction, SWIFT exclusion or a prohibition on disposal. A second estimation then incorporates multiple binary sanction variables simultaneously to assess which types of finan-

<sup>13</sup> Since various Russian banks were already subject to sanctions before the start of the estimation period, their transactions are ultimately a non-factor in the estimation results.

### Effect of sanctions against Russian banks

Item	Baseline specification		Distinction by type of financial sanction	
	(1)	(2)	(3)	(4)
	Inflows	Outflows	Inflows	Outflows
Sanctions	- 1.271*** (0.344)	- 1.996*** (0.564)	.	.
Anticipation	.	.	- 4.949*** (1.080)	- 7.793*** (1.091)
Capital market sanctions	.	.	- 1.177*** (0.196)	- 1.670*** (0.368)
SWIFT exclusion	.	.	- 10.263*** (1.178)	- 12.134*** (1.062)
Prohibitions on disposal	.	.	- 2.439*** (0.423)	- 3.750*** (0.264)
Observations	24,924	28,644	24,924	28,644
Adjusted R <sup>2</sup>	0.856	0.847	0.866	0.864

\*\*\* Significant at the 1% level, \*\* significant at the 5% level, \* significant at the 10% level. Bank account-specific and time-specific fixed effects are taken into account but not reported. Robust standard errors (clustered across bank accounts) in parentheses.

Deutsche Bundesbank

cial sanctions have a particularly strong impact on financial flows.

The above table presents the estimation results of equation (1). Non-sanctioned Russian banks serve as a control group in all estimates. The results should therefore be interpreted in comparison with this group. The first two columns show the coefficients for financial sanctions imposed on Russian banks irrespective of their type. The results are statistically significant for both inflows and outflows. The estimated coefficient of -1.271 (-1.996) means that the inflows (outflows) to or from the accounts of sanctioned Russian banks have fallen by 71.9% (86.4%) solely on account of the sanctions and irrespective of other influences. Columns (3) and (4) distinguish between the types of financial sanctions: all three binary variables are included in the estimation. The estimation also controls for anticipation effects regarding the SWIFT exclusion. The regression results are likewise negative and statistically highly significant. The coefficient of -1.177 (-1.670) for inflows (out-

flows) for capital market sanctions means that gross flows to and from the accounts of sanctioned Russian banks have fallen by 69.2% (81.2%). By comparison, the SWIFT exclusion had a stronger effect: transactions ground to a virtual halt (each -99.9%). Since the implementation of the SWIFT exclusion did not take place until a few days after the announcement, the anticipation effects between 1 March 2022 and 11 March 2022 are also visible. According to the estimation results, gross flows collapsed nearly completely even before the decision was actually implemented (-99.3%). The results of the prohibitions on disposal are likewise statistically highly significant and negative. Inflows (outflows) fell by 91.3% (97.6%). This means that all three types of financial sanctions lead to a decline in financial flows in the German TARGET2 component, with capital market sanctions, as the least severe sanctions, showing the weakest response in terms of value. According to the estimation results, SWIFT exclusion as well as prohibitions on disposal

cause transactions in TARGET2-Bundesbank to be discontinued almost entirely.<sup>14</sup>

The results illustrate that there was a general decline in the transactions of Russian banks recorded in the German TARGET2 component after 24 February 2022. Gross flows from both non-sanctioned and sanctioned Russian banks' accounts decreased following the expansion and tightening of sanctions as a result of Russia's invasion of Ukraine. Capital market sanctions, SWIFT exclusion and the prohibitions on disposal are likely to have a strong impact according to estimation results. The anticipation effects prior to the implementation of the SWIFT exclusion have also led to a statistically significant fall in inflows and outflows. However, potential circumvention effects cannot be ruled out per se: such transactions could be taking place via TARGET2 accounts in component systems of other euro

area countries or via alternative payment channels and systems.

---

**14** Additional robustness analyses with interaction terms which incorporate additional interdependencies of the sanctioned Russian banks do not change these results. Thus, potential sanctions overlaps do not appear to play a significant additional role.

*Indicators of valuation level present mixed picture*

Despite the war, analysts have continued to rate the fundamentals of enterprises in Europe (Euro Stoxx) and the United States (S&P500) as good. Since the beginning of the year, they have revised their sales outlook for the coming financial years upwards. However, analysts also assumed that profits would be squeezed by costs. Measured by the earnings yield based on the business outlook for the next 12 months, equity valuations on both sides of the Atlantic are more favourable than at the beginning of the year. By contrast, the lower implied cost of equity<sup>5</sup> has shown that the valuation level is somewhat higher. The main reason for this is that the implied cost of equity also took into account medium-term earnings prospects, which declined from a high level. By historical standards, equity valuations remain rather high overall in the United States and rather low in the euro area.

*Equity market funding low*

In the first three months of 2022, German stock corporations raised €1½ billion net in

new funds (previous quarter: €18½ billion). The volume of foreign shares in the German market rose by €9 billion over the same period. On balance, domestic non-banks were the sole buyers of equities (€20½ billion). By contrast, foreign investors – as is often the case in the run-up to dividend payment dates in the second quarter – and domestic credit institutions reduced their equity portfolios by €9 billion and €1½ billion net, respectively.

## Mutual funds

In the first quarter of 2022, domestic investment companies posted inflows of €35½ billion, following a quarter in which a very high volume of mutual fund shares had been issued (€68½ billion). On balance, specialised funds reserved for institutional investors were by far

*Sales and purchase of mutual fund shares*

---

**5** The implied cost of equity can be calculated using a dividend discount model; see Deutsche Bundesbank (2016).

the primary beneficiaries (€32 billion). Among the asset classes, mixed securities funds, in particular, saw significant inflows of capital (€14½ billion), but bond funds, open-end real estate funds (€6 billion each), and equity-based funds (€4½ billion) likewise recorded inflows. The outstanding volume of foreign mutual fund shares in Germany rose by €4 billion in the period under review. Mutual fund shares were bought on balance almost exclusively by domestic non-banks, which added fund shares worth €40½ billion net to their portfolios. Most of these shares were issued by domestic mutual funds. German credit institutions bolstered their fund portfolios by €1½ billion net, while non-resident investors reduced their fund portfolio in Germany by €2 billion net.

## ■ Direct investment

*Direct investment posts net capital exports*

Transactions in cross-border portfolio investment resulted in net capital exports of €38½ billion in the first quarter of 2022. Direct investment likewise recorded net outflows, albeit to a considerably lesser extent (€4½ billion).

*German direct investment abroad results in capital exports*

Enterprises domiciled in Germany expanded their foreign direct investment by €45 billion in the first three months of this year on balance, as against €39 billion in the previous quarter. In the process, they boosted the equity capital

they provided to foreign affiliates by €29 billion. Reinvested profits accounted for just over two-thirds of this. In addition, firms resident in Germany provided affiliated group entities abroad with additional loans worth €15½ billion, relying, on balance, exclusively on trade credits to do so. The first quarter saw considerable volumes of direct investment funds flowing from Germany to the United Kingdom (€14½ billion) and China (€7 billion). By contrast, return flows of funds from Sweden (€5½ billion) and Russia (€3½ billion) consisted predominantly of repayments of previously granted loans.

Conversely, foreign enterprises increased their direct investment in Germany sharply between January and March 2022 (€40 billion, compared with €6 billion in the fourth quarter of 2021). They enlarged their equity capital in German subsidiaries by 4½ billion. German enterprises saw considerably larger inflows of funds via intra-group credit transactions (€35½ billion). Additional loans made up the bulk of these transactions, on balance. In the first quarter, particularly high direct investment inflows were reported for the United Kingdom (€21½ billion), France (€4½ billion), Switzerland and the United States (€4 billion each). By contrast, sizeable net outflows to Estonia (€3 billion) and the Netherlands (€2 billion) were generated through repayments of intra-group loans.

*Capital inflows through foreign direct investment in Germany*

# The German economy

## Macroeconomic situation

*German economy weighed down by pandemic, high inflation and the Russian attack on Ukraine in Q1 2022*

Economic activity in Germany picked up slightly in the first quarter of 2022, after declining somewhat in the final quarter of 2021. According to the Federal Statistical Office's flash estimate, real gross domestic product (GDP) was 0.2% up on the quarter after seasonal adjustment.<sup>1</sup> Construction provided a strong boost, helped by the mild weather conditions. Thanks to a good start to the year, industrial output also increased somewhat on the quarter. The effects of Russia's war on Ukraine have been weighing considerably on the economy since the start of the conflict, however. Supply bottlenecks flared up again in industry and in construction, after having arguably eased somewhat at the beginning of the quarter.<sup>2</sup> The steep rise in energy prices, too, will have slowed output. Exports declined sharply in March and were also well below the previous quarter's level in the first quarter of 2022 as a whole. High energy prices also exacerbated the already high rate of price increase, diminishing the purchasing power of household incomes. This depressed private consumption, which was impaired further by the pandemic and the associated containment measures. By contrast, construction investment and investment in machinery and equipment are likely to have increased, despite the supply bottlenecks.

*Economic output could grow slightly at most in Q2*

Looking ahead to the second quarter, opposing forces are likely to have an impact on economic output. Headwinds are coming, in particular, from the high level of inflation, supply bottlenecks, high uncertainty and weaker foreign demand. These are being counterbalanced by the broad and extensive easing of coronavirus

mitigation measures. On balance, from today's perspective, these upward forces are likely to prevail by a slight margin at best.

Exports of goods declined significantly in the first quarter of 2022 in real terms. In regional terms, this was mainly due to a steep decline in exports to euro area countries, probably partly on account of the fairly weak pace of growth in the euro area. Exports to non-euro area countries also declined slightly, however. Exports to Russia fell considerably in terms of value.<sup>3</sup> In March, they dropped by just over three-fifths as a result of the sanctions and other measures taken in response to Russia's invasion of Ukraine. The value of exports to the newly industrialised Asian economies also decreased in the first quarter. By contrast, nominal exports to the United Kingdom remained virtually stable. Exports to the United States,

*Exports of goods down significantly in Q1*

### Aggregate output

Adjusted for price, seasonal and calendar effects

Source of unadjusted figures: Federal Statistical Office. **1** Price and calendar adjusted.  
 Deutsche Bundesbank

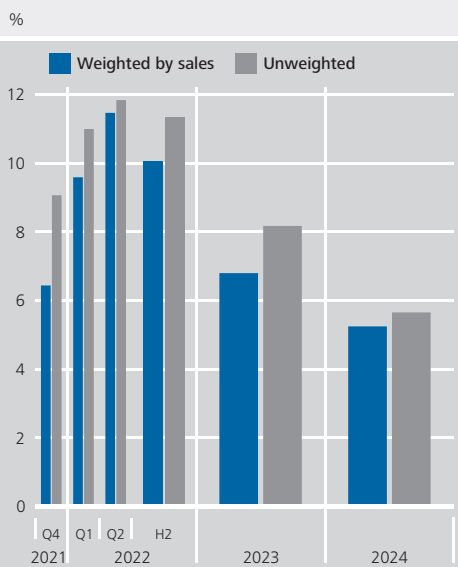

**1** Seasonal adjustment here and in the remainder of this text also includes adjustment for calendar variations, provided they can be verified and quantified.  
**2** See the box on pp. 58 f. of this Monthly Report.  
**3** In 2021, the value of goods exports to Russia accounted for a little less than 2% of German foreign trade.

## Supply bottlenecks likely to weigh on industrial production for quite some time

Since the beginning of 2021, there have been considerable bottlenecks in the supply of important intermediate products and raw materials. In Germany, this has primarily affected industry.<sup>1</sup> As a result, industrial production has not yet returned to its level prior to the coronavirus crisis, despite high demand for industrial products. These supply bottlenecks have continued to put significant strain on German industry this year. They had eased somewhat before the Russian attack on Ukraine.<sup>2</sup> The war, however, caused a relapse.<sup>3</sup> Some intermediate products are not available due to the war and sanctions. Logistical problems and high transport costs have also played a role. The resurgence of the pandemic in China and the associated stringent protection measures have further exacerbated supply problems.

In March 2022, the Bundesbank surveyed industrial enterprises as part of the Bundesbank Online Panel Firms (BOP-F) on the current and expected impact of supply bottlenecks on their production activity.<sup>4</sup> Of more than 500 manufacturing enterprises surveyed, 80% reported that their access to intermediate goods had deteriorated in 2021 or that they expected it to do so in 2022. These enterprises were then asked how strong the decline in output due to supply bottlenecks had been or was likely to be.<sup>5</sup> This helps provide an impression not only of the breadth of the impact of supply bottlenecks across enterprises, but also of its intensity. In addition, respondents were

(Expected) production losses stemming from supply bottlenecks\*

Source: Bundesbank Online Panel Firms, March 2022. \* Based on the responses of 404 (out of 507) manufacturing firms to the question of what percentage decline in the production of goods they had recorded or expected as a result of supply bottlenecks. No production losses were assumed for the remaining 103 industrial enterprises, which did not record or expect a deterioration in access to intermediate goods in 2021 and 2022.

Deutsche Bundesbank

**1** It is true that supply difficulties arose when the coronavirus pandemic started back in spring 2020. However, these bottlenecks have been weighing on the global economy since the spring of 2021 in particular, when global demand surged following the pandemic-induced lockdowns in the winter of 2020-21. The supply bottlenecks are therefore, in principle, a global phenomenon, which can be attributed to various factors on both the demand and supply sides. See Deutsche Bundesbank (2021a).

**2** See ifo Institute (2022a).

**3** In March and April 2022, 80% and 75% of enterprises, respectively, complained about bottlenecks in the procurement of intermediate products and raw materials. See ifo Institute (2022b). Purchasing managers also reported renewed supply chain disruptions, with both the war and pandemic protection measures in China playing a role. See BME (2022).

**4** See Deutsche Bundesbank (2022a). However, the relevant questions were only asked in March 2022 (wave 14). Answers were received during the period from 26 February 2022 to 23 March 2022.

**5** Six different periods were considered: the fourth quarter of 2021, the first quarter of 2022, the second quarter of 2022, the second half of 2022, and the years 2023 and 2024. The responses were also weighted by enterprise sales in 2021. No production losses were assumed for the 20% of enterprises which did not record or expect a deterioration in access to intermediate goods in 2021 and 2022. Exceptions to this simplified assumption – for example, if a company expected an improvement in access to intermediate products overall in 2022, but still feared production losses due to supply bottlenecks – would therefore imply even higher declines in production than calculated here.

asked to provide an estimate of the expected duration of the supply disruptions.<sup>6</sup>

The results suggest that supply bottlenecks weighed more heavily on output in the first quarter of 2022 than in the fourth quarter of 2021. This likely reflects a major decline in output in March as a result of the Russian attack on Ukraine.<sup>7</sup> Given the ongoing war in Ukraine, industrial enterprises expect production losses to worsen in the second quarter. According to the survey, that is when the supply chain problems will reach their peak. Expected production losses gradually decline thereafter. However, even in 2024, enterprises still expect distinct production losses due to supply bottlenecks.<sup>8</sup>

According to the survey results, the problems caused by supply bottlenecks will thus persist for longer than had been assumed in the Bundesbank's macroeconomic projection of December 2021. At that time, a gradual easing of supply bottlenecks by the end of 2022 was expected, with subsequent strong catch-up effects.<sup>9</sup> This will place a significant strain on industrial production and will cause a significant delay to the originally expected recovery. The survey results do also suggest that some catch-up effects from previously lost production could occur. For example, firms that experienced or expected a decline in production for at least one of the periods under review were asked whether they expected to be able to recover some of the production they had lost as a result of supply bottlenecks. Almost half said yes.<sup>10</sup> All in all, however, the survey results suggest a much more cautious view of supply bottlenecks and their consequences than the assumptions made in the December projection.

Two important factors need to be taken into account when interpreting these results. The Russian war of aggression began two days before the first industrial enterprise submitted its responses to the survey.

The responses could thus be strongly influenced by the invasion and its attendant uncertainties. These relate, in particular, to the reliability of the energy supply at their production sites in Germany.<sup>11</sup> The expected losses in production – some even lasting into 2024 – could partly reflect concerns about energy disruptions. Nevertheless, as long as the relevant supplies from Russia do not actually fail to materialise, the survey results are likely to overstate the expected production losses. This stands in contrast, however, to the pandemic situation in China, at least in the short term. The latest lockdown in Shanghai began at the end of March, and thus after the survey was completed. Production losses could therefore have been underestimated, especially in 2022.

---

**6** At the end of 2021, the German Economic Institute (*Institut der deutschen Wirtschaft, IW*) and the ifo Institute already carried out a survey on expected production shortfalls due to supply bottlenecks and their duration. In the IW economic survey in autumn 2021, three-quarters of the enterprises surveyed reported a loss in output of, on average, 7% for the fourth quarter of 2021. Moreover, enterprises said that they expected that the situation would only start to improve significantly from the second half of 2022 onwards. See German Economic Institute (2021). This is consistent with the results of the ifo Institute survey of November 2021, which show that industrial enterprises assumed, on average, that supply problems would last eight months, i.e. until mid-2022. See ifo Institute (2021).

**7** According to the German Association of the Automotive Industry, for example, fewer cable harnesses were supplied for the manufacture of motor vehicles. Besides Tunisia, their main country of manufacture is Ukraine. Owing to their specific nature, production of these items could not be moved or substituted on short notice. See German Association of the Automotive Industry (2022).

**8** A comparison of the weighted and unweighted results shows that larger enterprises consistently expect somewhat smaller production losses.

**9** See Deutsche Bundesbank (2021b).

**10** These enterprises were then asked how long they expected the catch-up process would last. More than 60% of them expected a period lasting until the end of the current year. Almost all remaining enterprises expected a period lasting until the end of 2023.

**11** The economic consequences of a cut in Russian gas supplies were already being discussed prior to 24 February 2022. From the moment Russia first publicly threatened to halt supply on 7 March 2022, at the very latest, the issue became omnipresent.

China and Japan even increased significantly. Broken down by category of goods, price-adjusted exports of intermediate goods and capital goods declined sharply, whilst exports of consumer goods picked up distinctly.

*Probable increase in business investment in machinery and equipment*

Until the start of the war, business investment in machinery and equipment is likely to have been supported by positive expectations about future output and by the easing of supply bottlenecks in the meantime. However, the outlook deteriorated considerably from March onwards, and uncertainty surrounding the continuation of the conflict is likely to have weighed on the propensity to invest. Nevertheless, business investment may have risen overall in the first quarter. The strong increase in the domestic sales of manufacturers of capital goods would suggest that this is the case. While this stood against a steep decline in the value of imports of capital goods, enterprises probably invested somewhat more in their vehicle fleets. This is indicated by the number of new commercial registrations of passenger vehicles, which rose slightly according to the German Association of the Automotive Industry (VDA). There was also a significant increase in the number of commercial vehicle registrations.

*Construction investment probably up substantially*

Construction investment probably increased substantially in the first quarter, as suggested by sales in the main construction sector – figures for which are available up to February – which were up considerably from the fourth quarter in terms of value. Even if the sharp rise in construction prices is taken into account, significant growth is still likely. Investment in public construction looks to have increased particularly strongly.

*Pandemic and high inflation weighing on private consumption*

Private consumption is likely to have declined in the first quarter of 2022. On the one hand, it was constrained by pandemic-related restrictions, which particularly affected the consumption of contact-intensive services. For example, first-quarter revenue in the hotel and restaurant services sector was significantly lower than in

the fourth quarter. In addition, high inflation reduced households' purchasing power. Uncertainty about the consequences of the war also weighed on the propensity to consume, especially at the end of the quarter. In the retail sector, price-adjusted sales declined somewhat. As in previous waves of the pandemic, sales figures fell especially steeply for bricks-and-mortar outlets selling textiles, clothing, footwear and leather goods, as well as for retailers of information and communication technology devices. However, retail sales via mail order and the internet, which were not affected by the protective measures, also fell sharply. In addition, there were probably fewer cars purchased. This is indicated by new car registrations for private owners, which declined markedly in the first quarter, according to VDA data.

Price-adjusted imports of goods posted a significant decline in the first quarter of 2022. From a regional perspective, the decline stemmed from trade with euro area countries, as was the case for exports. Imports from non-euro area countries were slightly higher, however, with the value of imports from OPEC countries and Russia increasing sharply. This was due to the high share of energy imports and the inflation in their prices. Nominal imports from China also rose strongly. Price-adjusted imports of capital goods declined steeply, whilst imports of intermediate goods were down slightly. Imports of consumer goods increased somewhat.

*Price-adjusted imports of goods down significantly*

## ■ Sectoral trends

Seasonally adjusted industrial production in the first quarter of 2022 increased slightly on the quarter (+1/2%). In January and February, it had initially recovered further. In March, however, it declined considerably as the war against Ukraine created many burdens, including new disruptions to supply chains. According to surveys by the ifo Institute, the percentage of enterprises reporting production delays caused by supply bottlenecks rose sharply again. While

*Recovery in industrial production slowed down, particularly by effects of war on Ukraine*

capital goods were still a driver of growth in the fourth quarter of 2021, their output dropped markedly in the first quarter of 2022. This was partly due to the fact that motor vehicle production, which is important for the German economy, was probably severely affected by the renewed tightening of supply bottlenecks. By contrast, manufacturers of other transport equipment and of computer, electronic and optical products saw a major increase in production. Industrial production was bolstered by a robust increase in the manufacture of consumer goods. In particular, the manufacture of pharmaceutical products increased considerably. Production of intermediate goods edged up slightly.

*Utilisation of industrial capacity stable at above average level*

According to the ifo Institute, capacity utilisation of tangible fixed assets in manufacturing remained constant between the surveys in January and April. It thus continued to distinctly exceed its long-term average. Capacity utilisation in capital goods manufacturing fell sharply, which is consistent with the lower output of capital goods. Although considerably more consumer goods were produced, capacity utilisation among their manufacturers remained unchanged. By contrast, capacity utilisation rose slightly for manufacturers of intermediate goods.

*Construction output up sharply, particularly owing to favourable weather conditions*

Construction output picked up strongly in seasonally adjusted terms in the first quarter of 2022 (+4%), growing substantially on the quarter in both the finishing trades and main construction sector. The increase in output in the main construction sector was spread equally across building construction and civil engineering. The main reason for the higher level of construction output was the mild weather for the time of year. According to ifo Institute surveys, the share of enterprises reporting materials shortages initially declined, much like in the industrial sector, but rose again significantly in March due to the war against Ukraine. In line with the sharp expansion in construction output, the utilisation of machinery and equipment increased significantly in the reporting

## Foreign trade

 Deutsche Bundesbank

period and remained high in a long-term comparison.

Activity in the services sector is likely to have declined in the first quarter. In the hotel and restaurant services sector, price-adjusted sales fell significantly on average in the first quarter compared with the previous quarter. However, they picked up again over the course of the quarter. In the reporting period, there were entry restrictions in place for hotels and restaurants, which have since been eased again. The coronavirus protection measures hit revenue in the accommodation sector much more strongly than they did food and beverage ser-

*Activity in services sector probably declining*

### Output in industry and in construction

2015 = 100, seasonally and calendar adjusted, quarterly data, log scale

Source of unadjusted figures: Federal Statistical Office. 1 Main construction sector and finishing trades. Deutsche Bundesbank

vices. Real sales in the retail sector declined markedly. Wholesale sales fell slightly, according to the data available up to February. Sales of motor vehicles were probably also down. On an average of January and February – data are available up until then – price-adjusted sales in the motor vehicle trade remained unchanged compared with the fourth quarter of 2021. However, the number of car registrations recorded by the VDA dropped dramatically in March and were slightly below the previous quarter’s level in the first quarter. The results of ifo Institute surveys on the business situation of enterprises also signal a decline in business activity in the services sector in the first quarter of 2022.

## Labour market

The labour market developed exceptionally favourably in the first quarter of 2022. Employment expanded strongly and unemployment

continued to decline markedly. Both indicators returned to the levels seen just before the outbreak of the pandemic. However, this also saw the return of the labour shortages seen before the crisis. The factors weighing on economic activity in the first quarter – the strong spread of the Omicron variant and, most recently, Russia’s invasion of Ukraine – are more likely to have had an adverse impact on actual hours worked by employees and labour productivity. Cyclical short-time work increased again somewhat, for instance. Nevertheless, the leading labour market indicators remained optimistic for the coming months after having been briefly shaken by the outbreak of war.

*Employment and unemployment barely touched by strains on the economy*

The number of employed persons rose sharply in the first few months of 2022. On an average of the first quarter, the seasonally adjusted number of persons in work rose by 217,000 on the quarter overall, representing an increase of 0.5%. In March, the previous peak in employment recorded in early 2020 was exceeded for the first time. The increase in employment is predominantly attributable to jobs subject to social security contributions. On an average of January and February alone – estimates do not yet go beyond that – 200,000 more persons were employed in jobs with full social security coverage than in the final quarter of 2021. There was robust employment growth in almost all economic sectors. The strongest increase was recorded in IT and in administrative and support services (including temporary employment). Some services sectors benefited from reduced containment measures to combat the pandemic over the course of the quarter. After a long period of stagnation, employment growth in the manufacturing sector also started to pick up a little. However, the strains entailed by the international setting are having the most noticeable dampening effect on employment growth in this sector.

*Employment up sharply in Q1, in a return to pre-crisis levels*

*Marked rise in short-time work over December and January*

ers increased slightly in December and January compared with November 2021. Since the average working hours lost per short-time worker were also markedly higher, the total loss of working hours rose by more than one-third in these two months. Once again, because of the pandemic, this mainly affected the hotel and restaurant services sector and, to a lesser extent, the wholesale and retail trade. However, the number of short-time workers fell again in February. This decline may have continued in the subsequent months as well, seeing as registrations for short-time work dropped significantly in March and April.

*Unemployment also back to pre-crisis levels*

Unemployment was distinctly down in the first quarter of 2022. In seasonally adjusted terms, the Federal Employment Agency registered just over 100,000 fewer unemployed persons than in the fourth quarter of 2021, with the corresponding rate falling by 0.2 percentage point. In April 2022, the number of unemployed persons continued to decline, dropping to 2.29 million, and the unemployment rate to 5.0%. This matches the level of the first quarter of 2020, which had not yet been affected by the pandemic. The number of unemployed persons covered by the statutory unemployment insurance scheme who can be placed relatively quickly is already lower than immediately prior to the outbreak of the pandemic, and has barely fallen in recent months. By contrast, the reduction in unemployment among those receiving the basic welfare allowance accelerated.

*Hours worked per employee and hourly productivity not yet fully recovered, however*

In contrast to employment and unemployment, other labour market indicators, such as hours worked per employee, have probably not yet returned to their pre-crisis levels.<sup>4</sup> Over the past two years, adjustment to the fluctuating level of output during the various waves of the pandemic has largely been through working hours. In addition to the massive use of short-time

<sup>4</sup> Hours worked and labour productivity are components of the national accounts, which were not yet available for the first quarter of 2022 as at the cut-off date for this report.

## Labour market

Seasonally adjusted, quarterly data

 Deutsche Bundesbank

work, the number of hours worked has also been shortened due to fewer overtime hours worked and the reduction of balances on working time accounts. Even if the long-term negative trend in hours worked – which is mainly due to the increasing share of part-time work – is taken into account, the number of hours worked is still significantly lower than would be expected if the crisis were fully overcome. In the reporting quarter, the spread of the Omicron wave is likely to have additionally reduced hours worked, as employees were sick or in quarantine. The outbreak of war in Ukraine and pandemic-related closures in China are placing further strain on economic activity. Labour productivity, which has also remained below its trend level so far, will continue to suffer as a result.

*Employment plans still expansionary despite burdens*

The leading labour market indicators, which focus mainly on further employment developments, remained very stable in expansionary territory despite the added uncertainty and foreseeable burdens caused by the Ukraine war. According to the employment barometers of the ifo Institute and the Institute for Employment Research (IAB), enterprises are planning to increase their staff numbers on balance. With infection rates on the decline, the outlook has improved, especially in some services sectors. In the manufacturing sector, by contrast, recruitment plans are less expansionary. Despite recent events, the number of reported vacancies subject to social security contributions has risen again. The ongoing shortage of qualified staff is also likely to have played a part in this. The time taken to fill vacancies is already very long and continues to rise. Unemployment is expected to decline further over the next few months, too, according to the IAB's survey of the heads of regional employment agencies.

## ■ Wages and prices

Negotiated wages rose considerably more strongly in the first quarter of 2022 than in the final quarter of 2021. In the first quarter, they

increased by 4.4% on the year, compared with 1.6% in the preceding quarter. This high growth rate was largely attributable to sizeable one-off payments in industry and large coronavirus bonuses, granted in the public sector of the Federal states, in particular. Meanwhile, basic pay adjusted for such one-off payments rose by just 1.6% in the first quarter year-on-year, after 1.8% in the fourth quarter of 2021. Actual earnings are likely to have risen even more sharply than negotiated wages in the first three months of the year. This is mainly because noticeably less short-time work meant that the number of hours worked was significantly higher than in the first quarter of 2021.

At present, the growth in negotiated wages is still being driven by old collective agreements, which were concluded in an environment of lower inflation rates and pandemic-related challenges. New agreements made in the first quarter were, likewise, usually still moderate despite the sharp rise in inflation. For example, the annualised wage growth in the latest wage agreements for private and public sector banks, the printing industry and insurance companies ranged from 1.6% to 2.4%. In the chemical industry, management and the trade unions agreed on a large one-off payment and for the agreement to have only a short term until the autumn of 2022 as a "bridging solution". The main reason for this was the uncertain economic outlook due to the war in Ukraine and the considerable rise in energy prices.

On the one hand, uncertainty about future economic developments and concerns about potential job losses could dampen wage increases somewhat in the upcoming wage negotiations. On the other hand, persistently high inflation rates and increasing labour market tightness are likely to contribute to noticeably more substantial wage settlements than in the recent past. For example, the trade unions' minimum aim is to compensate for the high inflation rates. In the steel industry, the IG Metall trade union is demanding a wage increase of 8.2% to apply for a 12-month period. The cur-

*Negotiated wages rose considerably in Q1 due to high one-off payments; actual earnings probably also rose substantially*

*Wage agreements still moderate so far, ...*

*... however, wage agreements could be markedly stronger over the coming months*

rent wage demands being made by trade unions in other sectors range from 6% to 7.5% to run for 12 months. It remains to be seen whether these demands are achieved. It should be borne in mind that higher prices for largely imported fossil fuels narrow the scope for income distribution within Germany.

*Inflation significantly higher in Q1*

Consumer prices spiked sharply higher again at the beginning of the year. In the first quarter of 2022, quarterly inflation as measured by the Harmonised Index of Consumer Prices (HICP) stood at 2.8% after seasonal adjustment, up from 1.2%. This was the strongest quarterly increase in prices in Germany since the beginning of monetary union. The momentum of energy price growth was particularly high given the dramatic rise in crude oil prices and market prices for not only gas but also electricity. Moreover, new supply bottlenecks caused a considerable acceleration in the rate of price increase for food and non-energy industrial goods. This was partly due to the impact of Russia's war against Ukraine, which likewise contributed to the sharp rise in energy prices. In terms of services, the price increase remained above average, but not quite as much so as in the previous quarters. Looking at the annual figures, too, the inflation rate rose significantly in the first quarter of 2022, from 5.4% to 6.1%. Factoring out the volatile components energy and food, however, the inflation rate fell distinctly, from 3.6% to 3.1%. However, this was mainly attributable to the end of the base effect as a result of the temporary VAT cut in the second half of 2020, which had lifted inflation in the final quarter of 2021.

*Broad-based price surge again in April*

In April, seasonally adjusted prices rose considerably on the month, although the increase was not as exceptionally strong as in March. This was chiefly attributable to energy prices, which fell slightly following a sharp rise in the previous month. By contrast, food prices rose even more steeply than they did when the temporary VAT cut was reversed in January of last year. There was a significant increase in the cost of meat, as well as cereals and dairy prod-

### Rates of pay and wage drift

Year-on-year change, on monthly basis

Sources: Federal Statistical Office (actual earnings) and Deutsche Bundesbank (negotiated rates of pay). <sup>1</sup> Wage drift is calculated as the annual change in the ratio of actual earnings to negotiated rates of pay.  
 Deutsche Bundesbank

ucts, in particular. Prices of non-energy industrial goods and services also rose on a broad basis. Compared with the previous year, prices grew by a total of 7.8%, compared with already 7.6% in March.<sup>5</sup> The last time such high rates were observed in the former West Germany was during the first Gulf War at the beginning of the 1980s. Excluding energy and food, the rate of price increase worked out at 3.9%, up from 3.4%.

Over the coming months, consumer price inflation could initially continue to rise slightly and then decline only moderately given the high rates of price increase at earlier stages of the pricing chain. In view of the war in Ukraine and supply bottlenecks resulting from the pandemic, producer prices for consumer goods (excluding food) rose sharply by historical standards in the period under review. Much the

*Inflation likely to remain high for the time being*

<sup>5</sup> The national consumer price index rose at a rate of 7.4%, up from 7.3%.

## Price developments at economic stages as classified for HICP purposes

Year-on-year percentage change

Deutsche Bundesbank

same is true of producer prices for food. This is likely to make industrial goods and food more expensive at the consumer level. In the services segment, too, enterprises have recently signalled an increasing willingness to pass through to consumer prices the higher cost of intermediate goods and the increase in the minimum wage due to be introduced in October 2022.<sup>6</sup> This option is made easier by ongoing high demand. Government relief measures relating to fuel, electricity and local public transport are likely to temporarily dampen the price increases somewhat. Overall, though, as things currently stand, the inflation rate is still likely to average around 7% this year. That said, uncertainty about the price outlook is particularly high at present.

## Order books and outlook

As things currently stand, German economic output is likely to increase slightly, if at all, in

the second quarter of 2022.<sup>7</sup> This is due to the interplay of strong but opposing forces. On the one hand, the easing of the measures designed to contain the coronavirus is likely to provide a major boost to services and the related consumer spending. On the other hand, the repercussions of Russia's attack on Ukraine are exacerbating the pressures exerted by high inflation and supply bottlenecks. They are also giving rise to further negative effects and will probably considerably weaken the strong recovery that had previously been anticipated. Household consumption is being dampened by the high level of inflation and by the uncertainty about how the conflict will evolve. High energy and materials costs and the heightened uncertainty are also weighing on output in the industrial sector and in construction. Supply

*Economic output likely to increase slightly in Q2, if at all; positive effect of easing of measures to contain the coronavirus probably offset by impact of war in Ukraine*

<sup>6</sup> See Deutsche Bundesbank (2022b).

<sup>7</sup> However, the outlook is highly uncertain and depends on further developments in the war on Ukraine. For more information on the possible macroeconomic effects in a severe crisis scenario, see Deutsche Bundesbank (2022c).

chains are once again coming under significant strain on account of the war in Ukraine and coronavirus lockdowns in China. According to Bundesbank survey results, this is likely to lead to an increase in output losses in manufacturing (see the box on pp. 58 f.). This is consistent with VDA data on the number of passenger cars manufactured, which recovered only partially in April from the sharp downturn in March and were still markedly lower than in the first quarter. Exports are also likely to remain markedly below the level of the first quarter due to the disruptions to foreign trade and lower foreign demand as a result of the impact of the war. This is suggested, amongst other things, by the sharp decline in export expectations in manufacturing, but also by the drop in China's imports in April.

*High inflation and uncertainty are holding back the recovery in private consumption*

Households' consumption expenditure could pick up significantly again in the second quarter. The broad and extensive easing of the measures taken to contain the coronavirus means that many of the consumption options that were previously restricted are available once more and are probably also being used. According to ifo Institute surveys, for example, the assessment of the current situation of firms in the hotel and restaurant services sector brightened considerably in April. Moreover, footfall figures, which are available up to mid-May, were considerably higher than in the first quarter. However, high inflation, the associated loss of purchasing power and the increased uncertainty surrounding the war on Ukraine are likely to represent a considerable drag on the recovery in private consumption. At last count, income expectations as measured by the market research institution Gesellschaft für Konsumforschung (GfK) fell to their lowest level in almost 20 years. Economic expectations and the propensity to purchase also declined considerably. The forecast consumer climate index fell to a historical low. Retail trade, in particular, could suffer from consumers' reluctance to consume. According to surveys conducted by the ifo Institute, business conditions there de-

 Deutsche Bundesbank

teriorated sharply during the period under review.

*Sentiment among firms considerably worse than in Q1*

The ifo business climate index recovered only marginally in April from the sharp downturn it suffered in March. This meant that sentiment remained considerably below the average of the first quarter. One of the main reasons for this was that firms' business expectations became much more pessimistic across all sectors. By contrast, firms believed their current business situation to be only slightly worse. This discrepancy can probably be explained by the fact that the very broad-based rise in concerns among some firms seen since March is not yet reflected in actual business activity. There are major differences between the sectors, however. Sentiment in the main construction sector and – to a somewhat lesser degree – in the manufacturing sector deteriorated particularly sharply, both in terms of expectations and the assessment of the current situation. A significant further increase in materials shortages has been a factor in both sectors since the outbreak of the war. Production plans in manufacturing fell sharply. By contrast, the situation among retailers deteriorated only somewhat. Elsewhere in the services sector, the assessment of the current situation actually improved. The easing of the measures intended to contain the coronavirus was probably a major factor in this.

*Orders situation in industry still good*

Industrial new orders rose significantly in the first quarter of 2022 compared with the previous quarter. This was due, in particular, to large orders; if these are excluded, new orders increased only slightly. Broken down by region, the inflow of new orders from non-euro area countries rose substantially. By contrast, slightly fewer new orders were received from the euro area countries and from within Germany.

Broken down by sector, demand for capital goods rose sharply. In particular, new orders in the manufacture of other transport equipment, which are usually very volatile, climbed steeply. Manufacturers of machinery and equipment, meanwhile, received distinctly fewer orders. Demand for consumer goods expanded strongly. Manufacturers of pharmaceutical products also saw a sharp rise in new orders. By contrast, the inflow of orders to intermediate goods producers declined slightly. According to data provided by the Federal Statistical Office, the order books and the reach of the order books continued to increase from already high levels. The results of ifo Institute surveys suggest that the orders situation in manufacturing remained good in April.

In the construction sector, output could decline in the second quarter. The mood among firms in the main construction sector suffered from the recent significant increase in materials shortages and a renewed worsening of labour shortages. The high cost of construction materials and higher interest rates on loans for building finance are placing an additional burden on the construction sector.<sup>8</sup> According to ifo Institute surveys, business expectations even fell to their lowest level since German reunification. In addition, the first quarter benefited from mild weather, which means that a countermovement is likely in the second quarter. As previously, the demand side is unlikely to be the limiting factor for construction. According to the data available up to February, new orders in the main construction sector declined sharply. However, surveys conducted by the ifo Institute show the reach of the order books to have remained exceptionally high in April.

*Construction sector suffering from, amongst other things, materials shortages and higher interest rates for building finance*

## Public finances\*

### General government budget

#### Outlook for 2022

*Fiscal policy also focused on fallout from Russian war of aggression*

Fiscal policy is currently largely focused on responding to the fallout, in terms of energy, social and defence policy, from the Russian war of aggression on Ukraine. The Federal Government is planning to become independent of Russian energy supplies and accelerate the shift to renewable energy. In addition, more funds are to be channelled into defence. Other measures aim to shield households and enterprises to a degree from the steeply rising energy costs. Assistance for refugees and for Ukraine is another factor. The Federal Government intends to finance these measures with new borrowing. To this end, further emergency loans are envisaged in the core central government budget, and a special fund for the German armed forces is planned. The coronavirus crisis, too, is continuing to weigh on public finances. However, the budgetary burdens associated with the crisis are likely to decline considerably this year.

*Deficit ratio could nonetheless fall markedly in 2022, as coronavirus-related burdens taper off*

From today's perspective, the general government deficit is likely to decline markedly this year (2021: deficit ratio 3.7%),<sup>1</sup> driven predominantly by fiscal coronavirus response measures expiring. The attendant relief will outweigh the budgetary burdens resulting from newly planned support measures. Moreover, current projections continue to foresee an economic recovery, assuming that the war and its fallout do not escalate further. This will also reduce the deficit. Under these conditions, the debt ratio will drop considerably (2021: 69.3%).

*Outlook for 2022 significantly less favourable than expected at start of year*

The outlook for 2022 is now significantly less favourable than expected at the start of the year. This is chiefly down to additional burdens on the expenditure side, among them the new fiscal measures. In addition, the unexpectedly sharp rise in prices will drive up costs for gov-

ernment consumption, in particular. The interest burden will increase, especially for inflation-linked Federal securities. The strain from new measures will be only moderate on the revenue side,<sup>2</sup> and the stronger price increases will even have an easing effect: in April, the Federal Government projected a weaker increase in real gross domestic product (GDP) for 2022 than in January but raised its projection somewhat for nominal private consumption and gross wages and salaries. Viewed in isolation, this increases the expected revenue from taxes and social contributions. However, the fact that revenue developments were surprisingly favourable up to the end of the period under review irrespective of this has had an even more positive effect: the latest official tax revenue forecast is around €40 billion higher than the forecast from autumn 2021 (see pp. 74 ff.).

#### Outlook for the medium-term planning period

Next year, the deficit is likely to decline further, assuming the coronavirus crisis does not flare up again and the fallout from the war in Ukraine does not worsen. While structural surpluses were recorded before the coronavirus crisis, the coming years are likely to see signifi-

*Significant structural deficits likely in the medium term; central government with broad leeway for deficits*

\* The section entitled "General government budget" relates to data from the national accounts and the Maastricht debt ratio. This is followed by more detailed reporting on budgetary developments (government finance statistics). No data are yet available for local government or the statutory health and public long-term care insurance schemes for the reporting quarter. These will be analysed in the short commentaries in upcoming issues of the Monthly Report.

<sup>1</sup> Meanwhile, the Federal Government's stability programme from April reports a deficit ratio of 3.4% for 2022, which is almost unchanged from 2021. Compared with this, developments appear likely to be more favourable. For a more detailed assessment of the national accounts projection from the stability programme, see Independent Advisory Board to the Stability Council (2022).

<sup>2</sup> The national accounts record the one-off energy price allowance as a monetary social benefit. In the government finance statistics, it reduces tax revenue. In each case, it is recorded in net terms, i.e. less the income tax to be paid on it.

cant structural deficits, mainly at the central government level. While the Federal Government announced that compliance with the debt brake would resume from 2023 onwards, it is planning to make use of the extensive general reserves, which will result in a correspondingly higher deficit. Even more extensive deficits are expected in central government's special funds, particularly the planned Armed Forces Special Fund and the Energy and Climate Fund (ECF). The additional leeway for deficits in the special funds as well as from the core budget reserves amounts to around €230 billion in total (currently 6% of GDP, see p. 77). That is likely to be all but fully utilised by 2026, meaning that the deficits could be almost 1½% of GDP higher on average between 2023 and 2026 than without that scope.

## High uncertainty

*Outlook uncertain: economy as a whole, measures, use of special funds*

However, the outlook for this year and beyond is highly uncertain. For example, the fallout from the war could intensify further and additionally impair macroeconomic developments.<sup>3</sup> This may lead to the adoption of additional fiscal support measures. Moreover, it is difficult to predict how outflows from central government's special funds will develop from year to year. This is likely to have a significant impact on the path of general government deficits. It is also unclear whether the ECF is even allowed to make any use of credit authorisations: the vast majority were justified under the escape clause by the need to address the coronavirus pandemic. The Federal Constitutional Court is currently reviewing some of the transfers.

## Fiscal policy in a difficult economic environment

*No compelling case for broad-based credit-financed fiscal stimulus at present*

Government budgets are a key anchor of stability in times of crisis. That said, there is no compelling case for a broad-based credit-financed fiscal stimulus at present. The baseline scenarios of current projections generally indi-

cate that the economy is recovering. The pace of recovery may now be more subdued than previously expected, but it has not ground to a halt. Supply-side disruptions, for one, have emerged, and broad-based price pressures have started to take hold. In an economic situation such as this, additional credit-financed demand impulses have smaller real effects and tend to increase price pressures.

If developments prove to be less favourable, with the economic recovery stalling or even suffering a setback, the automatic stabilisers will initially take effect. These include, in particular, expenditure-side benefits for unemployment or short-time work. In addition to the automatic stabilisers, further fiscal stabilisation measures may also be warranted.

*If crisis intensified, automatic stabilisers would initially take effect; ...*

If supply bottlenecks and high price pressures persisted in this case, a broad-based credit-financed fiscal demand stimulus would still not be advisable. Additional government assistance should then ideally target households and enterprises in need. Assuming overall demand is not suffering, it would be appropriate to counterfinance such targeted measures immediately. This is because, in a scenario of supply bottlenecks and high price pressures, it would be counterproductive to further strengthen general demand. In this context, counterfinancing ultimately means that any burdens on the private sector, such as those caused by high energy costs, are directly redistributed via the government budget without further exacerbating macroeconomic disruptions.

*... if supply bottlenecks and price pressures persist, counterfinancing of further targeted measures appropriate; ...*

By contrast, a broad-based fiscal stimulus could be considered if demand looks set to weaken severely – for example, if export markets suffer a sizeable slump or substantial distortions on the financial markets spill over to the real economy. Given such conditions, the underlying price pressures would be expected to ease and expansionary fiscal policy to meet with underutilised capacity.

*... credit-financed stimulus worth considering if demand weakens severely*

### Tax revenue\*

Year-on-year percentage change, quarterly figures

Source: Federal Ministry of Finance. \* Comprises joint taxes as well as central government taxes and state government taxes. Including EU shares in German tax revenue, including customs duties, but excluding receipts from local government taxes.

Deutsche Bundesbank

*Energy policy: price signals set important incentives*

Germany's energy policy is directed at making the country independent of Russian energy supplies as soon as possible and achieving net zero carbon emissions over the long term. These aims are well achievable, in particular, if the appropriate price signals are able to take effect. Prices reflect (relative) shortages and provide incentives to reduce energy consumption and switch to renewable energy. Government measures should not obstruct this process. Care should therefore be taken to ensure that government assistance to households and enterprises distorts price signals as little as possible.

*Focus on low-income households, lump-sum transfers instead of price controls*

One-off payments that top up means-tested social transfers such as the basic allowance are therefore particularly suitable for providing targeted support to households in the short term. Generally speaking, such transfers must be adjusted promptly if they would otherwise no longer cover basic needs. The one-off energy price allowance is designed differently: it will be paid out to all employees subject to income tax. As it is taxable, however, it will provide greater relief to low-income households. Irrespective of the distributional effects, the planned ad hoc energy tax cuts are detrimental for another reason: they weaken the – generally desirable – price signals.

New transfer, guarantee and loan programmes are in place for enterprises hit hard by soaring costs, disrupted supply chains or embargoes. Such programmes are relatively targeted as long as they are reserved for enterprises suffering substantial distress. They must meet the requirements of the European framework for state aid. It is important to limit such programmes to temporary crisis situations. Moreover, it is crucial that they do not hinder the necessary process of transformation. First, enterprises receiving support should have a business model that promises to be sustainable, also in view of the planned reduction of carbon emissions as part of the energy transition. Second, these programmes should maintain the incentive for enterprises to rapidly cut back on their energy consumption and turn to renewable sources.

*Support hard-hit enterprises without hindering transformation*

## Budgetary development of central, state and local government

### Tax revenue

#### First quarter of 2022

Over the first three months of 2022, tax revenue<sup>4</sup> rose sharply on the year (+18%, or +€31 billion; see the chart above and the table on p. 73). However, this growth was also driven by sizeable base effects. First, VAT rates had been temporarily lowered in the second half of 2020, which was still dampening revenue in the first quarter of 2021. Second, revenue from import VAT was lower in the same quarter last year on a one-off basis, as the date on which payments were due had been pushed back. Third, revenue in the first quarter of 2022 is likely to have been bolstered by lower tax deferrals and the receipt of previously deferred payments.

*Tax revenue grew sharply in Q1*

<sup>4</sup> Including EU shares in German tax revenue but excluding receipts from local government taxes, which are not yet known for the quarter under review.

*Strong rise in VAT revenue*

More than half of the unadjusted growth in tax revenue in the first quarter was thus attributable to VAT. Including the one-off effects mentioned above, VAT receipts shot up by 34%. Adjusted for these one-off effects, however, the increase in VAT revenue is still likely to have been considerable. It was boosted by dynamic growth in nominal private consumption and housing construction.

*Wage and profit-related taxes likewise made significant contribution to growth*

At 11%, growth in wage tax receipts was likewise strong. Gross wages and salaries rose dynamically, mainly because short-time work decreased considerably. Revenue growth includes the effects of fiscal drag. This was partly offset by relief in the tax scale. These measures compensate for the bracket creep expected in autumn 2020 for 2021: the basic income tax allowance was raised by 2½% and the other income tax brackets were also shifted just over 1% to the right (specified tax rates then only apply to higher nominal taxable income). Child benefit payments stagnated following the significant increase in benefits at the beginning of 2021. As child benefit is deducted from wage tax, this item rose as a result. Of the profit-related taxes, assessed income tax, in particular, saw a sharp increase. Corporation tax also grew dynamically. Advance payments for the current year, a major revenue item, recorded a considerable plus.

### New tax estimate for 2022 to 2026 as well as additional tax cuts

*Tax estimate for 2022 projects dynamic revenue growth of 6½%*

According to the latest official tax estimate, general government tax revenue will rise by 6½% on the year in 2022 (see also the table on p. 74). This is mainly due to the dynamic economic growth in nominal terms, which is what the estimates are based on. Nominal private consumption, in particular, will rise sharply. Wages will likewise see a considerable increase – pushing up revenue, not least through progressive income taxation. Meanwhile, tax measures will have a marked dampening effect on revenue. Write-off provisions were im-

### Tax revenue

proved and income tax rates lowered at the start of the year.

However, sizeable tax cuts not passed by the Bundestag until after the tax estimate was finalised have not yet been factored into it, as it only takes account of applicable law. For example, a one-off energy price allowance subject to income tax will be paid out of wage and income tax receipts to persons in employment. The fuel tax rates on petrol and diesel will be cut to the European minimum rate for three months. Furthermore, the basic income tax allowance is to be raised again retroactively from 1 January 2022. These are just some of the

*However, additional tax cuts likely to considerably reduce growth*

The figures shown here are the revenue shortfalls that will result if this practice is continued. For this purpose, the revenue effects are roughly estimated. The calculations are based on the Federal Government's current spring projection and wage tax receipts based on current tax estimates (according to the national accounts). The basic income tax allowance also shifts in line with the inflation rate of the previous year.

Deutsche Bundesbank

measures that are planned. Overall, these steps are likely to reduce revenue in 2022 by 2½% of tax revenue.

*Significant increase in revenue in tax estimate for 2023*

In 2023, revenue growth is expected to amount to 4½%. Nominal macroeconomic growth will be significant and progressive taxation will continue to have a bolstering effect. On balance, legislative changes that have already been adopted and thus taken into account will not have any major effect.

*Sizeable shortfalls due to additional legislative changes likely in 2023, too*

The tax cuts not passed by the Bundestag until after the tax estimate was finalised and therefore not factored into it will play a considerably smaller role in 2023 than in 2022, as the one-off energy price allowance and the fuel tax cut will only affect the current year. That said, the measures will still reduce next year's revenue by 1%. However, the Federal Finance Minister also announced that the Federal Government wishes to continue compensating for bracket creep in income tax. According to established

practice, the inflation forecast for 2022 released in the autumn of 2022 would be factored into the income tax scale from 1 January 2023. Owing to high inflation, this is likely to result in further revenue shortfalls amounting to just over 1% of tax revenue in 2022. In addition, the guidelines set out by the Federal Fiscal Court to prevent the foreseeable double taxation of future pensions still need to be implemented. One particular measure to this end under the coalition agreement is for the full deductibility of pension contributions to be brought forward from 2025 to 2023.

According to the tax estimate, revenue is projected to rise by an average of 3½% in the subsequent years up to 2026. On balance, legislative changes will play no major role. The forecast is therefore a fairly direct reflection of the assumptions regarding macroeconomic developments and progressive taxation. However, the basic income tax allowance is likely to be raised again in 2023 and the years that follow.

*Solid growth in medium term partly reflects fiscal drag*

In line with the approach taken since the middle of the last decade, further measures to compensate for bracket creep can also be expected. Given the Federal Government's macroeconomic assumptions, this would mean reductions of just under ½ percentage point in revenue growth each year. Risks also exist in connection with the solidarity surcharge, the constitutionality of which has been called into question for various reasons. All in all, tax revenue is therefore expected to be significantly lower in the medium term than indicated by the latest tax estimate.

### Revision of the tax estimate compared with previous forecasts

*Strong upward revisions for 2022 and subsequent years compared with autumn estimate*

Compared with the autumn 2021 tax estimate, revenue is up and will reach a peak of €46 billion in 2023. One key reason for this is that the annual result for 2021 was far more favourable than anticipated – especially with respect to profit-related taxes. VAT revenue also saw stronger growth than forecast in the autumn. It was assumed that these positive developments would for the most part persist. The revised macroeconomic assumptions have also resulted in slight revenue increases. This is because the tax estimate looks at nominal developments, not the less favourable real (price-adjusted) developments. In this context, the especially high revenue-yielding macroeconomic reference variables (nominal private consumption and gross wages and salaries) were revised upwards. According to the new estimate, profit-related taxes will also develop significantly more favourably than forecast in the autumn – despite the growth rate of macroeconomic profits being revised downwards in the national accounts. The higher estimate is the product of the previous year's favourable outcome and the stable development of advance payments in the first quarter.

*Upward revision also compared with pre-coronavirus outlook*

Even compared with expectations from the period directly prior to the coronavirus crisis, the working group's forecast is now significantly higher than had been projected in au-

tumn 2019 for these years. Revenue-reducing legislative changes enacted in the meantime will therefore be more than offset. The current estimate exceeds the autumn 2019 forecast by €14 billion for 2022. A large amount of additional revenue will be generated by unexpectedly high profit-related taxes up to the first quarter of 2022 and more favourable nominal macroeconomic assumptions. These positive influences will outweigh the revenue shortfalls stemming from legislative changes enacted in the meantime, even though such shortfalls will also be significant this year, at almost €40 billion. In 2023 and 2024, additional revenue will increase to €24 billion and €30 billion compared with the autumn 2019 estimate: the upward revision of nominal macroeconomic assumptions will become more relevant and the improved write-off provisions agreed in the meantime will cease to cause significant shortfalls.

## Central government budget

### First quarter of 2022

Central government posted a deficit of €19 billion in the first quarter of 2022. This constitutes a decrease of €33 billion on the previous year. Revenue rose sharply, going up by €20 billion (26%) almost exclusively on account of higher tax receipts (+28%). Only part of this could be explained by the lack of the previous burdens arising from VAT measures and savings from EU contributions (€4 billion reduction in advance deductions from tax revenue). Underlying dynamics were also strong. As in 2021, the Bundesbank did not distribute any profit because it increased its risk provisions in the wake of asset purchases. Overall, expenditure fell sharply, decreasing by €13 billion (-11%). This was mainly due to declining transfers to enterprises in response to the coronavirus pandemic (-€7 billion) and reduced loans to the Federal Employment Agency (-€6 billion).

*Sharp decrease in deficit in Q1*

## 2022 budget planning

*March draft of central government budget contains pandemic-related emergency borrowing*

In mid-March, the Federal Government presented a new draft of the 2022 central government budget. Like the previous government's original draft, this envisaged net borrowing of almost €100 billion. According to the new draft, the borrowing limit imposed under the debt brake was to be exceeded by €81 billion. The government justified this on the basis of an emergency resulting from the coronavirus pandemic.<sup>5</sup> The draft also included the first energy price relief package. However, it did not yet account for the impact of the Russian war of aggression on Ukraine. An amendment to the draft budget was therefore announced.

The Federal Government adopted this amendment to the draft budget on 27 April, which increases the projection for net borrowing by €39 billion. A global revenue shortfall item of €13 billion covers tax revenue losses resulting from the second energy price relief package of

24 March. The amendment also includes larger allocations of VAT funds by central government to the state governments to compensate them for costs relating to refugees from Ukraine. The spending increase of €26 billion includes higher transfers for Ukraine and basic allowance benefits for refugees. It also covers new business aid, with transfers totalling €5 billion being budgeted for businesses hit hard by higher energy costs. However, the bulk of additional spending is bundled into a global precautionary item of €14 billion. Its intended purpose is to finance measures that have already been approved or for which approval is imminent.<sup>6</sup>

*Amendment to draft budget contains additional borrowing authorisations of €39 billion for war-related budgetary burdens*

The Bundestag's Budget Committee did not make any changes to the estimated net borrowing figure in its final deliberations. Owing to the now more favourable tax estimate, additional revenue will amount to €12 billion net. This is offset by higher expenditure appropriations in the same amount. On balance, the majority of these are attributable to coronavirus-related spending in the healthcare sector. In addition, estimated interest expenditure was revised upwards by €5 billion in view of interest rate developments in the capital markets. This is reflected in significantly reduced expected premia for new issues.<sup>7</sup> Higher other expenditure appropriations, particularly for business aid, are offset by a decrease in budgeted global spending increases.<sup>8</sup>

*Final deliberations: revenue increases from tax estimate offset by additional spending*

Net borrowing therefore remains at €139 billion. A cyclical burden (€8 billion) and financial transactions (€3 billion) are factored out of the debt brake.<sup>9</sup> On balance, this leaves a structural

*Standard limit under debt brake exceeded by €116 billion*

<sup>5</sup> For details on the context provided back when the first draft budget for 2022 was passed in June 2021, see Deutsche Bundesbank (2021).

<sup>6</sup> For the sake of budgetary clarity, it is important to attribute budgeted expenditure to specific budget items, wherever possible.

<sup>7</sup> The volatility of interest expenditure could be prevented by recording premia and discounts on an accrual basis. See Deutsche Bundesbank (2022c), p. 61.

<sup>8</sup> This means that, on balance, budgeted global spending cuts are the dominant factor here.

<sup>9</sup> The debt brake ceased to apply to special funds without their own borrowing authorisation at the start of 2022; according to the government's March decision, it expects them to record deficits of €12 billion.

Deutsche Bundesbank

net borrowing figure of €128 billion, exceeding the standard limit by €116 billion. The consequence that this will have for the repayment schedule is that, from 2028 onwards, the available scope for borrowing will be just over €3½ billion lower annually.

In the amendment to the draft budget, the government cites two emergencies in its reasoning for exceeding its borrowing limit. First, it points out that the budgetary situation is particularly strained due to the fallout from the pandemic and the war. Second, it considers the planned measures necessary, but does not explain the reasons in more detail. The Constitutional Court of Hesse had previously called for detailed discussions on the Hessian debt brake in such a context.<sup>10</sup> According to the court, justification would have to be given, in particular, as to why the additional measures and their

*Little justification for exceeding standard limit*

*Plans cautious as things currently stand, but fraught with uncertainty*

As things currently stand, it appears that a generous approach has been taken in drawing up the plans for the current year – as in the budgets for previous years. However, the plans are also fraught with considerable uncertainty in view of the Russian war of aggression and its impact.

<sup>10</sup> See Constitutional Court of Hesse (2021).

credit financing are appropriate for addressing the particular emergency situation. With regard to the amendment to the draft central government budget, the economic environment would probably be particularly relevant, as this is already characterised by steep price rises and supply bottlenecks. Higher government deficits tend to amplify such frictions (see the remarks on p. 71). The government's lowering of energy taxes also appears to require further explanation. Whilst it is true that this can offset higher energy prices, it masks price signals that would be helpful in overcoming the emergency caused by the energy crisis in an economically efficient manner.

*Sparing reserves increases amount of net borrowing requiring repayment and therefore also seems to warrant a more detailed explanation*

Emergency borrowing could be more limited in scope if the government already made use of its reserves of €48 billion this year. On the one hand, budgets would initially come under pressure starting in 2023 due to the absence of available reserves. On the other hand, pressure on budgets would be eased from 2028 onwards because the emergency loans that would have to be repaid would then be smaller. The government has stated that it needs the reserves in order to comply with the standard limit under the debt brake from 2023. However, it should then explain why it is not possible to make use of other financing options. Another reason why this appears remarkable is that the government has already created additional scope for borrowing for the coming years via special funds: specifically, the revised accounting method for special funds means that it has an additional €112 billion at its disposal compared with the plans drawn up by the previous government.<sup>11</sup>

*Planned deferral of repayments in conflict with debt brake objectives*

Under the Basic Law, emergency borrowing must be tied to a repayment schedule. As things currently stand, the emergency loans taken out in 2020 are to be repaid at €3½ billion per year starting in 2023. The annual repayments of €11 billion for the 2021 budget are to then commence three years later. When it adopts the 2022 budget, the Bundestag is now expected to defer these repayment sched-

ules. The government is aiming to defer repayments until 2028 and to make repayments until 2058 instead of until 2042, as had previously been decided. The reasoning given for this is the timetable for the repayment of European debt for assistance provided in response to the coronavirus pandemic (NextGenerationEU). This delay is not compatible with the debt brake's intention to protect future budgets from borrowing burdens. However, from an economic perspective, it is worth considering amending the constitutional rules on repayment obligations given low debt ratios.<sup>12</sup>

### Benchmark figures up to 2026

In mid-March, the Federal Government also adopted the benchmark figures for the 2023 budget and for the medium-term fiscal plan up to 2026. From 2023, it plans to resume compliance with the debt brake's standard limit for structural net borrowing. To this end, it intends to use up the reserves by the end of 2025: it plans to withdraw €28 billion next year, and the remainder in the two years thereafter. To ensure compliance with the standard limit, nominal expenditure will also increase very little in the later planning years. To some extent, this means that expenditure cuts are needed in real terms. Defence spending is a different matter, though. This is set to rise permanently to over 2% of GDP. This is not reflected in the benchmark figures, as the government wishes to initially finance the additional expenditure via borrowing by a new Armed Forces Special Fund. It is not yet known how the spending increases will be financed in the core budget after that. Pressure on the central government budget will be eased with respect to payments to the social security funds: as of next year, the special grants for the statutory health insurance scheme are set to be discontinued. However, it is likely that the health insurance institutions will then have to sharply raise their supplementary contribution rates. The repayment obliga-

*Benchmark figures up to 2026: return to standard debt brake limit with reserve funds and tight expenditure appropriations*

<sup>11</sup> See Deutsche Bundesbank (2022b), pp. 70 ff.

<sup>12</sup> See Deutsche Bundesbank (2022c), p. 64.

tions for emergency loans no longer appear in the figures, as they have – as explained above – been deferred to a period outside the fiscal planning horizon. In the longer term, demographic developments are also likely to place a serious strain on the central government budget in the form of higher grants to the pension insurance scheme. The fact that the replacement rate for a standard pension is set to be frozen at 48% beyond 2025 will have an exacerbating effect. As previously planned, the retirement age is to remain fixed at 67 from 2032. Under these conditions, the contribution rate and the central government grants linked to it will rise considerably.

#### Central government’s off-budget entities: first quarter and outlook

Central government’s off-budget entities (excluding the Financial Market Stabilisation Fund (SoFFin), bad banks and other entities that use commercial double-entry bookkeeping) posted a surplus of €½ billion in the first quarter of 2022.<sup>13</sup> This constituted a year-on-year improvement of €5 billion. The ECF saw its deficit shrink by €2 billion. This was due, on balance, to the higher price of electricity, which reduced the need for subsidies for electricity from renewable energy sources. At the start of 2021, the Economic Stabilisation Fund was still €1½ billion in deficit as a result of coronavirus aid for enterprises (in particular guaranteed assistance loans provided via the KfW). At the beginning of this year, repayments culminated in a surplus of €2 billion.

For 2022 as a whole, a surplus is expected for the existing off-budget entities, albeit on a significantly smaller scale than the previous year’s figure (€76 billion).

- The Federal Government is planning a deficit of €6 billion for the ECF. Last year, a special payment from central government produced a surplus of €54 billion.<sup>14</sup>

- The Flood Relief Fund will record a deficit this year. Last year, it posted a sizeable surplus as a result of pre-funding by central government amounting to €16 billion.
- The Economic Stabilisation Fund should see its surplus climb considerably (2021: €2 billion), provided this is not counteracted by new assistance measures.
- The off-budget entity “Provision for final payments for inflation-indexed Federal securities” will see significant growth in its surplus on the back of increased transfers to the fund by central government due to the high rate of inflation.

Overall, the off-budget entities could nevertheless end up in deficit this year. This is because, over the course of the year, a new special fund is to be introduced, financing additional defence spending via borrowing. The Federal Government is planning the increased expenditure in response to Russia’s war of aggression. The special fund is to sit outside the scope of the debt brake and receive borrowing authorisations of €100 billion. The plans provide for a repayment obligation but without a specific timeframe attached. Setting up the special fund in the form envisaged will only be possible with the approval of opposition parties – a high bar which ought to avoid setting a precedent undermining the binding effect of the debt brake. Given that a budget plan for the special fund has yet to be presented, for the current year it is almost impossible to gauge the volumes involved in procurement and thus to say what the fund’s deficit will be.

*High borrowing authorisation for planned Armed Forces Special Fund ...*

*Improved result for central government’s off-budget entities in Q1 2022: alleviating factors for ECF and Economic Stabilisation Fund*

*Off-budget entities set to record surplus for 2022 as a whole*

<sup>13</sup> According to figures from the Federal Ministry of Finance. The Ministry does not publish quarterly data for off-budget entities that keep commercial accounts, such as the bad bank FMS Wertmanagement. The deficit generated by SoFFin, which uses a single-entry accounting system, has also been excluded, as it is largely a result of the loans passed on to FMS Wertmanagement.

<sup>14</sup> Central government made this payment under recourse to the escape clause. This is currently the subject of review by the Constitutional Court in response to a constitutional complaint lodged by the opposition.

... weighing on outlook for off-budget entities

Together with the pre-funded ECF, it is foreseeable that the off-budget entities will post relatively large deficits over the next few years.

## State government budgets<sup>15</sup>

### Core budgets in the first quarter of 2022

Very high surplus in Q1 against backdrop of strong tax growth

State government core budgets finished the first quarter with a very high surplus of €14 billion. In the same quarter last year, where the effects of the pandemic were more strongly felt, they had posted a deficit of €3 billion. Revenue went up by 15%, driven primarily by strong growth in tax revenue (+25%, or +€18 billion). Receipts from public administrations went down. A contributing factor here appears to have been the lower central government payments for business aid, which are channelled through the state budgets.

There was barely any increase in expenditure overall. On the one hand, other operating expenditure, in particular, climbed significantly (+9%), not least as a result of the regular coronavirus testing in schools. In addition, personnel expenditure – a major expenditure item – rose rather strongly, by 6%. This was partly because the federal states were still paying out coronavirus bonuses with preferential tax treatment to salaried employees and civil servants in the first quarter of 2022. There was also a distinct increase in transfers to public administrations, especially to local government. Meanwhile, other expenditure fell sharply. Lower volumes of business aid, which – as mentioned previously – is financed by central government, probably played an especially significant role here.

Barely any expenditure growth in net terms

### Core budgets and off-budget entities in 2022 as a whole

Taken together, the federal states' core budgets and off-budget entities recorded a surplus of €3½ billion last year. This year, the outturn could be similar. On the expenditure side, a continued marked increase is likely not least in personnel expenditure – a sizeable budget item; transfers to local government will also probably show another perceptible rise. When it comes to other operating expenditure, however, declining spending on vaccination centres and school testing in particular will likely take some of the pressure off over the remainder of the year. On the other hand, rising prices will probably exert a counter effect. The Russian war of aggression is affecting federal states' expenditure levels primarily in the form of additional costs associated with refugees. Central government appears to be shouldering the bulk of that burden, however. According to the most recent tax estimate, tax revenue will continue to rise markedly this year, even after the surprisingly high result of the previous year. While that increase will be much less strong

Core budgets and off-budget entities: result could change to only a limited extent this year

<sup>15</sup> The quarterly data on state government budgets are based on the monthly cash statistics for the core budgets.

than at the beginning of the year, it will nevertheless ease the strain on state government budgets. Even so, the tax cuts passed by the Bundestag could weigh on state government revenue.

### State government debt brakes

*Only limited burdens left over from coronavirus pandemic; emergency borrowing needs careful justification*

Many federal states have activated the debt brake escape clause again this year in order to cope with the coronavirus crisis. Pandemic-related encumbrances ought now to be modest, however. The year 2021 already saw tax revenue exceed the level expected in the last pre-crisis tax estimate of 2019. The same is true of the tax revenue now projected for the current year. On the expenditure side, coronavirus measures appear to have weighed on the federal states as a whole to the tune of almost €10 billion in 2021. As things stand today, those encumbrances are likely to at least halve this year. Overall, it must be ensured that emergency borrowing is utilised in a targeted manner for overcoming emergency situations. This was also stressed in the ruling delivered at the start of April by the Federal Constitutional Court for Rhineland-Palatinate. Consequently, the federal states must give sound justification in the event of recourse to emergency borrowing.

## ■ Social security funds

### Pension insurance scheme

#### First quarter

*Balanced result for the quarter; steep growth in contribution receipts*

In the first quarter of 2022, the statutory pension insurance scheme had a largely balanced budget, an improvement of €3 billion on the year. Total revenue increased by 4½%. There was a strong 5½% rise in contribution receipts, bolstered by the sharp decline in short-time work. Central government funds increased by 1%: their growth was subdued on account of the rules coupling them to the weak wage developments of 2020 this year.

At 1%, expenditure growth was much weaker than growth in revenue. The reason for that minimal growth was the fact that pensions were not raised in western Germany in mid-2021 (eastern Germany: +0.7%). The number of pensions hardly changed. Moreover, it appears that the volume of supplementary payments being made and retroactively paid out in connection with the basic pension introduced last year remained very limited.

*Low pension adjustment from previous year dampened expenditure dynamics*

#### 2022 as a whole

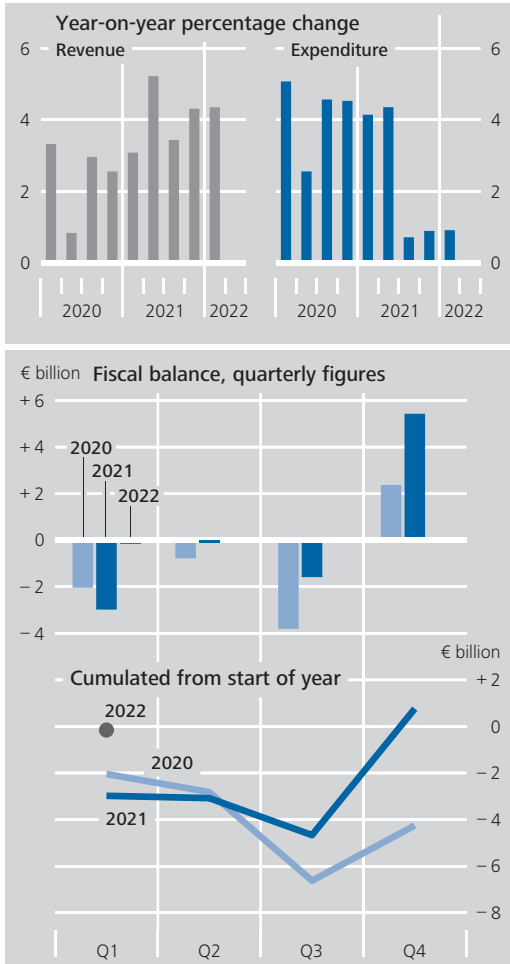

Expenditure in the year as a whole is rising significantly more strongly than in the first quarter of 2022. Most notably, individual pensions on an average for this year are growing far more strongly, increasing by 3% in total. Mid-year will see them rise by a sharp 5½%, averaged across Germany (5.35% in western Germany and 6.12% in eastern Germany). The key reason behind this development is the high wage growth recorded in 2021, which was driven by declining short-time work. The catch-up factor will dampen the pension adjustment by just over 1 percentage point: after being temporarily suspended it has now been reactivated by the Federal Government. This factor compensates for the application of the safeguard clause in 2021 that meant that pensions were not cut. The Federal Government expects the number of pensions to grow somewhat more strongly again than in the previous year (2021: +0.2%). On top of this, expenditure on the basic pension is climbing: the pension insurance scheme is paying it out on an increased scale and still has basic pensions for 2021 to pay out retroactively. By contrast, revenue growth is likely to be significantly weaker for the year as a whole.

*Large pension adjustment in 2022 accelerating growth in expenditure*

Compared with the previous year, 2022 as a whole is thus likely to see a deterioration in the finances of the pension insurance scheme. Following a surplus of almost €1 billion last year (according to provisional figures), a significant deficit is now on the cards for 2022, which could amount to around €2½ billion. There are

*Considerable deficit anticipated for 2022 as a whole*

year as to maintain a minimum replacement rate of 48%. Without this measure, they would be just over 2% higher on an annual average for a time. While there are other new measures which will increase expenditure, they will have less of an impact. One such measure is a blanket rise in pensions from 2024 onwards for those who entered retirement due to a reduction in earning capacity between 2001 and 2018.

Once reserves have run down to their minimum level, balance will need to be restored to the budget. To achieve this, as things stand today, the contribution rate will need to rise by roughly 1 percentage point around 2025 (without factoring in any risks related to the Russian war of aggression). The contribution rate currently sits at 18.6%.

Looking at the longer term, further measures will bring increased financial pressures for the pension insurance scheme. The Federal Government is planning to continue the 48% threshold for the replacement rate beyond 2025. In order to fund this, contribution rates will need to rise more sharply. This will also place a greater strain on the central government budget because central government funds will increase along with the contribution rate, among other things.

*Contribution rate will nevertheless rise sharply around 2025*

*Contributions set for strong increases in the long term against backdrop of permanent 48% threshold*

risks on the revenue side with regard to the economic impact of the Russian war of aggression.

### Medium and long-term outlook

It is to be expected that the deficits recorded by the pension insurance scheme will increase over the coming years. The reserves will then gradually be depleted. On balance, new measures will serve to curb the rise in pension expenditure up to the end of 2025, though. The suspension of the pension adjustment formula until 2025 means that pensions will grow at a slower pace, increasing by only so much every

*New pension policy plans will alleviate pressure over medium term*

## Federal Employment Agency

### First quarter

The Federal Employment Agency posted a deficit of €2 billion in the first quarter of 2022.<sup>16</sup> This was €8 billion lower than in the same quarter of 2021 because the Federal Employment Agency was no longer as severely affected by the coronavirus crisis.

*Sharp fall in deficit in year-on-year terms*

<sup>16</sup> In the core budget, i.e. excluding the civil servants' pension fund. Transfers to the fund are recorded as expenditure, lowering the core budget balance. These transfers were suspended in 2022 because of the coronavirus crisis (as they have been since 2020).

*Strong increase in revenue from higher contribution receipts*

Revenue rose substantially, by 7½% overall. Growth in contribution receipts was somewhat stronger still, at 9½%. This was due, not least, to the recovery in employment after the coronavirus crisis. Revenue from insolvency benefit contributions fell by 13%, pushed down by the reduction in the contribution rate from 0.12% to 0.09% at the start of 2022.

*Sharp decline in expenditure due to improved labour market situation*

Expenditure was 42% down on the same quarter of the previous year, though it was still 24% higher than in the last pre-crisis year of 2019. In the first quarter of 2022, expenditure on unemployment benefits fell by 26% on the year (-€1½ billion) and expenditure on short-time work by as much as 74% on the year (-€6 billion).

### 2022 as a whole

*Favourable labour market developments, but risks in connection with war*

The Federal Employment Agency's finances will improve considerably in 2022 provided that the labour market and wages develop in line with the Federal Government's spring projection. However, if the Russian war of aggression exerts stronger impacts these could quickly place a significant strain on the Federal Employment Agency, for example through short-time working benefits.

*Current baseline scenario more favourable than the Federal Employment Agency's budget plan*

The Federal Employment Agency's budget plan from last autumn still envisaged a deficit of €1½ billion in the core budget. However, as in the past, the estimates for spending on active labour market policy measures are likely to be on the generous side. The Federal Government's spring forecast also shows revenue growing at a markedly higher rate than had

### Finances of the Federal Employment Agency\*

Source: Federal Employment Agency. \* Including transfers to the civil servants' pension fund and before payment of central government grants.  
 Deutsche Bundesbank

been projected. Overall, this scenario foresees a close-to-balance budget, following a deficit of €22 billion last year (before central government grants of €17 billion).

euro banknotes put into circulation by the Bundesbank in accordance with the accounting regime chosen by the Eurosystem (see also footnote 2 on banknote circulation in Table III.2). The volume of currency actually put into circulation by the

Bundesbank can be calculated by adding to this total the item "Intra-Eurosystem liability/claim related to banknote issue" (see "Other liability items"). <sup>5</sup> Excluding central governments' deposits. <sup>6</sup> In Germany, only savings deposits.

Discrepancies may arise from rounding. \* The banking system's liquidity position is defined as the current account holdings in euro of euro area credit institutions with the Eurosystem. Amounts are derived from the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. <sup>1</sup> Figures are daily averages for the reserve maintenance period ending in the month indicated. Following the changeover in the frequency of Governing Council monetary policy meetings to a six-week cycle, a reserve maintenance period no longer ends in every month. No figures

are available in such cases. <sup>2</sup> Source: ECB. <sup>3</sup> Includes liquidity provided under the Eurosystem's asset purchase programmes. <sup>4</sup> From August 2009 includes liquidity absorbed as a result of the Eurosystem's foreign exchange swap operations. <sup>5</sup> From 2002 euro banknotes and other banknotes which have been issued by the national central banks of the Eurosystem and which are still in circulation. In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is

allocated to the ECB on a monthly basis. The counterpart of this adjustment is shown under "Other factors". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly basis, to the NCBS, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro banknotes allocated to an NCB and the value of the euro banknotes which that NCB has put into circulation is likewise shown under "Other factors". From 2003 euro

banknotes only. <sup>6</sup> Remaining items in the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. <sup>7</sup> Equal to the difference between the sum of liquidity-providing factors and the sum of liquidity-absorbing factors. <sup>8</sup> Calculated as the sum of the "Deposit facility", "Banknotes in circulation" and "Credit institutions' current account balances".

### III. Consolidated financial statement of the Eurosystem

\* The consolidated financial statement of the Eurosystem comprises the financial statement of the European Central Bank (ECB) and the financial statements of the national central banks of the euro area Member States (NCBs). The balance sheet items for foreign currency, securities, gold and financial instruments are valued at market

rates at the end of the quarter. <sup>1</sup> In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is allocated to the ECB on a monthly basis. The counterpart of this adjustment is disclosed as an "Intra-Eurosystem liability related to

III. Consolidated financial statement of the Eurosystem

Liabilities to non-euro area residents denominated in euro	Liabilities to euro area residents in foreign currency	Liabilities to non-euro area residents denominated in foreign currency			Counterpart of special drawing rights allocated by the IMF	Other liabilities 2	Intra-Eurosystem liability related to euro banknote issue 1	Revaluation accounts	Capital and reserves	As at reporting date
		Total	Deposits, balances and other liabilities	Liabilities arising from the credit facility under ERM II

euro banknote issue". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly basis, to the NCBs, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro

banknotes allocated to the NCB according to the aforementioned accounting procedure and the value of euro banknotes put into circulation is also disclosed as an "Intra-Eurosystem claim/liability related to banknote issue". 2 For the Deutsche Bundesbank: including DEM banknotes still in circulation. 3 Source: ECB.

#### IV. Banks

##### 1. Assets and liabilities of monetary financial institutions (excluding the Deutsche Bundesbank) in Germany \*

###### Assets

€ billion

\* This table serves to supplement the "Overall monetary survey" in Section II. Unlike the other tables in Section IV, this table includes - in addition to the figures reported by

banks (including building and loan associations) - data from money market funds.  
1 See footnote 1 in Table IV.2. 2 Excluding deposits of central governments.

IV. Banks

in other Member States <sup>2</sup>				Deposits of central governments		Liabilities arising from repos with non-banks in the euro area	Money market fund shares issued <sup>3</sup>	Debt securities issued <sup>3</sup>		Liabilities to non-euro area residents	Capital and reserves	Other Liabilities <sup>1</sup>	Period
With agreed maturities		At agreed notice		Total	of which: domestic central governments			Total	of which: with maturities of up to 2 years <sup>3</sup>				
Total	of which: up to 2 years	Total	of which: up to 3 months

<sup>3</sup> In Germany, debt securities with maturities of up to one year are classed as money market paper; up to the January 2002 Monthly Report they were published together

with money market fund shares. <sup>4</sup> Statistical breaks have been eliminated from the flow figures (see also footnote \* in Table II.1).

#### IV. Banks

##### 2. Principal assets and liabilities of banks (MFIs) in Germany, by category of banks \*

€ billion

End of month	Number of reporting institutions	Balance sheet total <sup>1</sup>	Cash in hand and credit balances with central banks	Lending to banks (MFIs)			Lending to non-banks (non-MFIs)					Participating interests	Other assets <sup>1</sup>
				Total	of which:		Total	of which:			Securities issued by non-banks		
					Balances and loans	Securities issued by banks		Loans	Bills

\* Assets and liabilities of monetary financial institutions (MFIs) in Germany. The assets and liabilities of foreign branches, of money market funds (which are also classified as MFIs) and of the Bundesbank are not included. For the definitions of the respective items, see the footnotes to Table IV.3. **1** Owing to the Act Modernising Accounting Law (Gesetz zur Modernisierung des Bilanzrechts) of 25 May 2009, derivative financial instruments in the trading portfolio (trading portfolio derivatives) within the meaning of

Section 340e (3) sentence 1 of the German Commercial Code (Handelsgesetzbuch) read in conjunction with Section 35 (1) number 1a of the Credit Institution Accounting Regulation (Verordnung über die Rechnungslegung der Kreditinstitute) are classified under "Other assets and liabilities" as of the December 2010 reporting date. Trading portfolio derivatives are listed separately in the Statistical Series Banking statistics, in Tables I.1 to I.3. **2** For building and loan associations: including deposits under savings

IV. Banks

Deposits of banks (MFIs)			Deposits of non-banks (non-MFIs)							Bearer debt securities outstanding <sup>5</sup>	Bank savings bonds	Capital including published reserves, participation rights capital, funds for general banking risks	Other liabilities <sup>1</sup>	End of month

2022 Mar.	3,128,670	12,145	537,335	562,538	102,513
Apr.	3,154,265	12,984	550,922	562,634	100,923
May	.	.	.	.	.

<sup>1</sup> The reserve maintenance period starts on the settlement day of the main refinancing operation immediately following the meeting of the Governing Council of the ECB for which the discussion on the monetary policy stance is scheduled. <sup>2</sup> Article 5 of the Regulation (EU) 2021/378 of the European Central Bank on the application of minimum reserve requirements (excluding liabilities to which a reserve ratio of 0% applies, pursuant to Article 6(1)(a)). <sup>3</sup> Amount after applying the reserve ratio to the reserve base. The reserve ratio for liabilities with agreed maturities of up to two years was 2%

between 1 January 1999 and 17 January 2012. Since 18 January 2012, it has stood at 1%. <sup>4</sup> Article 6(2) of the Regulation (EU) 2021/378 of the European Central Bank on the application of minimum reserve requirements. <sup>5</sup> Average credit balances of credit institutions at national central banks. <sup>6</sup> Average credit balances less required reserves after deduction of the lump-sum allowance. <sup>7</sup> Required reserves after deduction of the lump-sum allowance.

\* The interest rate statistics gathered on a harmonised basis in the euro area from January 2003 are collected in Germany on a sample basis. The MFI interest rate statistics are based on the interest rates applied by MFIs and the related volumes of euro-denominated deposits and loans to households and non-financial corporations domiciled in the euro area. The household sector comprises individuals (including sole proprietors) and non-profit institutions serving households. Non-financial corporations include all enterprises other than insurance corporations, banks and other financial institutions. The most recent figures are in all cases to be regarded as provisional. Subsequent revisions appearing in the following Monthly Report are not specially marked. Further information on the MFI interest rate statistics can be found on the Bundesbank's website (Statistics/Money and capital markets/Interest rates and yields/Interest rates on deposits and loans). <sup>o</sup> The statistics on outstanding amounts are collected at the end of the month. <sup>1</sup> The effective interest rates are calculated either as

annualised agreed interest rates or as narrowly defined effective rates. Both calculation methods cover all interest payments on deposits and loans but not any other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance. <sup>2</sup> Data based on monthly balance sheet statistics. <sup>3</sup> Secured and unsecured loans for home purchase, including building and home improvements; including loans granted by building and loan associations and interim credits as well as transmitted loans granted by the reporting agents in their own name and for their own account. <sup>4</sup> Loans for consumption are defined as loans granted for the purpose of personal use in the consumption of goods and services. <sup>5</sup> For the purpose of these statistics, other loans are loans granted for other purposes such as business, debt consolidation, education, etc. <sup>6</sup> Including overdrafts (see also footnotes 12 to 14 on p. 47).

For footnotes \* and 1 to 6, see p. 44\*. For footnote x see p. 47\*. + For deposits with an agreed maturity and all loans excluding revolving loans and overdrafts, credit card debt: new business covers all new agreements between households or non-financial corporations and the bank. The interest rates are calculated as volume-weighted average rates of all new agreements concluded during the reporting month. For overnight deposits, deposits redeemable at notice, revolving loans and overdrafts, credit card debt: new business is collected in the same way as outstanding amounts for the sake of simplicity. This means that all outstanding deposit and lending business at

the end of the month has to be incorporated in the calculation of average rates of interest. <sup>7</sup> Estimated. The volume of new business is extrapolated to form the underlying total using a grossing-up procedure. <sup>8</sup> Including non-financial corporations' deposits; including fidelity and growth premiums. <sup>9</sup> Excluding overdrafts. <sup>10</sup> Annual percentage rate of charge, which contains other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance.

For footnotes \* and 1 to 6, see p. 44\*. For footnotes + and 7 to 10, see p. 45\*;  
**11** For the purposes of the interest rate statistics, a loan is considered to be secured if collateral (amongst others financial collateral, real estate collateral, debt securities) in at least the same value as the loan amount has been posted, pledged or assigned.  
**12** Including revolving loans which have all the following features: (a) the borrower may use or withdraw the funds to a pre-approved credit limit without giving prior notice to the lender; (b) the amount of available credit can increase and decrease as funds are borrowed and repaid; (c) the loan may be used repeatedly; (d) there is no obligation of regular repayment of funds. **13** Overdrafts are defined as debit balances

on current accounts. They include all bank overdrafts regardless of whether they are within or beyond the limits agreed between customers and the bank. **14** Including convenience and extended credit card debt. Convenience credit is defined as the credit granted at an interest rate of 0% in the period between payment transactions effected with the card during one billing cycle and the date at which the debt balances from this specific billing cycle become due. **15** The amount category refers to the single loan transaction considered as new business. **x** Dominated by the business of one or two banks. Therefore, the value cannot be published due to confidentiality.

Sources: The calculations for the insurance sectors are based on supervisory data according to Solvency I and II and for pension funds on IORP supervisory data and own data collections as of 2020 Q1. Until 2019 Q4 these are compiled using Solvency I supervisory data, supplemented by voluntary reports and own calculations. <sup>1</sup> Accounts receivable to monetary financial institutions, including registered bonds, borrowers' note loans and registered Pfandbriefe. For pension funds as of 2020 Q1 fair values, previously book values. <sup>2</sup> Including deposits retained on assumed reinsurance as well as registered bonds, borrowers' note loans and registered Pfandbriefe. For pension funds

as of 2020 Q1 fair values, previously book values. <sup>3</sup> Including reinsurance recoverables and claims of pension funds on pension managers. <sup>4</sup> Valuation of listed securities at the corresponding consistent price from the ESCB's securities database. <sup>5</sup> Not including the reinsurance business conducted by primary insurers, which is included there. <sup>6</sup> The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included. <sup>7</sup> Change in data sources.

Sources: The calculations for the insurance sectors are based on supervisory data according to Solvency I and II and for pension funds on IORP supervisory data and own data collections as of 2020 Q1. Until 2019 Q4 these are compiled using Solvency I supervisory data, supplemented by voluntary reports and own calculations. <sup>1</sup> Including deposits retained on ceded business as well as registered bonds, borrowers' note loans and registered Pfandbriefe. <sup>2</sup> Including claims of pension funds on pension managers and entitlements to non-pension benefits. <sup>3</sup> Technical reserves "life" taking account of

transitional measures. Health insurance is also included in the "non-life insurance" sector. <sup>4</sup> Own funds correspond to the sum of "Net worth" and "Shares and other equity". <sup>5</sup> Not including the reinsurance business conducted by primary insurers, which is included there. <sup>6</sup> Valuation at book values. The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included. <sup>7</sup> Change in data sources.

1 Bearer debt securities with maximum maturities according to the terms of issue of over 4 years. Structured debt securities, debt securities with unscheduled redemption, zero coupon bonds, floating rate notes and bonds not denominated in Euro are not included. Group yields for the various categories of securities are weighted by the amounts outstanding of the debt securities included in the calculation. Monthly figures

are calculated on the basis of the yields on all the business days in a month. The annual figures are the unweighted means of the monthly figures. Adjustment of the scope of securities included on 1 May 2020. 2 End of year or month. 3 Source: Deutsche Börse AG. 4 Only debt securities eligible as underlying instruments for futures contracts; calculated as unweighted averages.

Source: Bundesbank calculations based on Federal Statistical Office data. <sup>1</sup> Annual figures based on the calculations of the Federal Statistical Office. Bundesbank supplementary estimations for the reporting years after 2011 that are not yet available. The quarterly figures contain numerous off-budget entities which are assigned to the general government sector as defined in the national accounts but are not yet included in the annual calculations. From 2012 also including the bad bank FMSW. <sup>2</sup> The annual figures do not tally with the sum of the quarterly figures, as the

latter are all provisional. The quarterly figures for some insurance sectors are estimated. <sup>3</sup> The development of the types of expenditure recorded here is influenced in part by statistical changeovers. <sup>4</sup> Including discrepancies in clearing transactions between central, state and local government. <sup>5</sup> On the revenue side, this contains proceeds booked as disposals of equity interests and as loan repayments. On the expenditure side, this contains the acquisition of equity interests and loans granted. <sup>6</sup> Including central government liquidity assistance to the Federal Employment Agency.

Sources: Federal Statistical Office; Federal Employment Agency. \* Annual and quarterly figures: averages; calculated by the Bundesbank; deviations from the official figures are due to rounding. 1 Workplace concept; averages. 2 Monthly figures: end of month. 3 Number within a given month. 4 Mid-month level. 5 Relative to the total civilian labour force. 6 Excluding government-assisted forms of employment and seasonal jobs, including jobs located abroad. 7 From January 2017 persons receiving additional income assistance (unemployment benefit and unemployment benefit II at the same time) shall be assigned to the legal category of the Third Book of the Social Security

Code (SGB III). 8 Statistical break due to late recording of unemployed persons in the legal category of the Second Book of the Social Security Code (SGB II). 9 Unadjusted figures estimated by the Federal Employment Agency. In 2019 and 2020, the estimated values for Germany deviated from the final data by a maximum of 0.1% for employees subject to social contributions, by a maximum of 0.9% for persons solely in jobs exempt from social contributions, and by a maximum of 55.3% for cyclically induced short-time work. 10 From May 2021, calculated on the basis of new labour force figures. 11 Initial preliminary estimate by the Federal Statistical Office.

\* Non-financial groups admitted to the Prime Standard segment of the Frankfurt Stock Exchange which publish IFRS consolidated financial statements on a quarterly or half-yearly basis and make a noteworthy contribution to value added in Germany. Excluding groups engaged in real estate activities. 1 Earnings before interest, taxes, depreciation and amortisation. 2 Quantile data are based on the groups' unweighted return on sales. 3 Annual figures do not always match the sum of the two half-year fig-

ures. See Quality report on consolidated financial statement statistics, p. 3. 4 Adjusted for substantial changes in the basis of consolidation of large groups and in the reporting sample. See the explanatory notes in Statistical Series Seasonally adjusted business statistics. 5 Including groups in agriculture and forestry. 6 From this point onwards: significant changes in IFRS standards, impairing comparability with previous periods.

\* Assets and liabilities vis-à-vis all countries within and outside the euro area. Up to December 2000 the levels at the end of each quarter are shown, owing to revaluations, at market prices; within each quarter, however, the levels are computed on the basis of cumulative transaction values. From January 2001 all end-of-month levels are valued at market prices. **1** Mainly net claims on TARGET2 balances (acc. to the respective country designation), since November 2000 also balances with non-euro area central banks

within the ESCB. **2** Mainly long-term debt securities from issuers within the euro area. **3** Including estimates of currency in circulation abroad. **4** See Deutsche Bundesbank, Monthly Report, October 2014, p. 22. **5** Difference between External assets and External liabilities. **6** Euro opening balance sheet of the Bundesbank as at 1 January 1999.

## XII. External sector

### 8. External positions of enterprises \*

€ million

\* The assets and liabilities vis-à-vis non-residents of banks (MFIs) in Germany are shown in Table 4 of Section IV, "Banks". Statistical increases and decreases have not been

eliminated; to this extent, the changes in totals are not comparable with the figures shown in Table XII.7.

\* The effective exchange rate corresponds to the weighted external value of the currency concerned. The method of calculating the indicators of the German economy's price competitiveness is consistent with the procedure to compute the effective exchange rates of the euro. A decline in the figures implies an increase in competitiveness. The weights are based on trade in manufactured goods and services. For more detailed information on methodology and weighting scale, see the website of the Deutsche Bundesbank (<https://www.bundesbank.de/content/796162>). 1 The calculations are based on the weighted averages of the changes in the bilateral exchange rates of the euro vis-à-vis the currencies of the following countries: Australia, Bulgaria, Canada, China, Croatia, Czechia, Denmark, Hong Kong, Hungary, Japan, Norway, Poland, Romania, Singapore, South Korea, Sweden, Switzerland, the United Kingdom and the United States. Where current price and wage indices were not available, estimates were used. 2 Includes countries belonging to the group EER-19 and additionally Algeria, Argentina, Brazil, Chile, Colombia, Iceland, India, Indonesia, Israel, Malaysia, Mexico,

Morocco, New Zealand, Peru, Philippines, the Russian Federation, Saudi Arabia, South Africa, Taiwan, Thailand, Turkey, Ukraine and United Arab Emirates. The ECB suspends the publication and calculation of the euro foreign exchange reference rate against Russian rouble with effect from March 2, 2022 until further notice. For the calculation of effective exchange rates, an indicative rate is used for the Russian Federation from that date. It is calculated from the daily RUB/USD rates determined by the Bank of Russia in conjunction with the respective ECB's euro foreign exchange reference rate to the US dollar. 3 Annual and quarterly averages. 4 Euro area countries (from 2001 including Greece, from 2007 including Slovenia, from 2008 including Cyprus and Malta, from 2009 including Slovakia, from 2011 including Estonia, from 2014 including Latvia, from 2015 including Lithuania) as well as Canada, Denmark, Japan, Norway, Sweden, Switzerland, the United Kingdom and the United States. 5 Euro area countries (current composition) and countries belonging to the group EER-19. 6 Euro area countries (current composition) and countries belonging to the group EER-42.

## Overview of publications by the Deutsche Bundesbank

This overview provides information about selected recent economic and statistical publications by the Deutsche Bundesbank. Unless otherwise indicated, these publications are available in both English and German, in printed form and on the Bundesbank's website.

The printed publications are available free of charge to interested parties and may be obtained through the Bundesbank's order portal. Up-to-date figures for selected statistical datasets are available on the Bundesbank's website. In addition, the new Statistical Series provide a new basic structure and advanced options for using data and are also available on the Bundesbank's website.

### ■ Annual Report

- The impact of the Eurosystem's monetary policy on Bitcoin and other crypto tokens
- The performance of German credit institutions in 2020

### ■ Financial Stability Review

### ■ Monthly Report

A list of the articles published in the period from 2010 to 2021 is available on the Bundesbank's website.

#### Monthly Report articles

##### July 2021

- Cross-border corporate takeovers: the impact of internationalisation on enterprises in Germany
- Crypto tokens and decentralised financial applications
- Digital risks in the banking sector
- Macroprudential policy and growth-at-risk
